

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

INDEX OF CONTENTS.

JANUARY TO JUNE, 1900.

A

ABERDEEN, the Cruickshank Botanic Gardens at, 283, 313
Abies brevifolia, 314
Abies nobilis, male flowers of, 365
Acacias, 196
Acalypha hispida, 389, 406
 Acorn with three embryos, 255
Adansonia digitata, 58
Adiantum c. v. imbricatum, fertile frond of, 28, 45, 60
Adiantum Farleyense, seedling, 45
Egle sepiaria (*Citrus trifoliata*), 269
Eranthus grandiflorus, 242
Agapetes buxifolia, 197
Agave americana variegata, 261; *A. Jacquiniana*, 30
 Agricultural Bulletins, 217
 Agricultural Department of Aberdeen University, 58; education, 154; returns for 1899, 365
 Alderney, 393
 Alexandra Palace and grounds as a recreation ground, 202
Allium zebdanense, 326
 Alpine bog-garden, the, 259
 Alpine garden, the, 10, 71, 84, 118, 168, 180, 213, 292, 309, 338, 407
 Alpine plants, raising, from seeds, 84, 149
 Alpines, choice, at the Temple Show, 376
Alyssum corymbosum, 407
 American blight, observations on, 403
 American Department of Agriculture, the, 9
 American notes, 178, 260
Amomum angustifolium, 59
Amorphophallus titanum, 59
Androsace sempervivoides, &c., 292
Anemone angulosa, 204
Aniba perutilis, 329
Ansellia gigantea, 258
Anthurium, coloured leaved, 403
Anthuriums, 260; pot-bound, 123
 Antwerp, coming horticultural exhibitions at, 25
 Apiary, the, 49, 79, 103, 190, 279, 310, 345
 Apple, Cox's Orange Pippin, origin of, 333, 352
 Apple election, an, 368
 Apple Gabalva, 165; at Cardiff Castle, 204
 Apple, Hoary Morning, 92; Lane's Prince Albert, 235; Lord Suffield, 187; Newton Wonder, 45, 60, 77, 235, 253, 285; Red Winter Calville, 350; Ribston Pippin, influence of stock upon scion in the case of, 108; Stanway Seedling, 13
 Apple, the, 99
 Apples, &c., at Sherborne Castle, 124; Belle de Pontoise and Striped Beefing, 188
 Apples, from the Antipodes, 139, 186, 218, 250, 282; Hambling's Seedling and Newton Wonder, 29; in Scotland, 82; late flowering, 285
Aquilegia baikalensis, 407
 Arboretum, experiments in Canada, 384
Arbutus Unedo (Tree Strawberry), 243

Archontophoenix Cunninghamii, 108
Areca lutescens, 117
 Arizona, exploration in, 403
Asarum proboscideum, 407
Aspidistras, cultivation of, 124
 Atriplex, or Australian Salt-bush, 90
Attalea princeps, the story of, 27
Aubrietia deltoidea, 297
Auricula Giant Yellow Border, 329; sportiveness in the, 358
Auriculas, 36
 Australia, fruits of South, 250
Azalea Mrs. A. E. Endtz, 301
Azalea indica grafted on *Rhododendron celestinum*, 233
Azaleas, Indian, in Belgium, 15

B

BACKHOUSE, Jas. & Son, catalogue of botanical plants for sale by, 170
 Balchin, presentation to Mr. W., 58
 Bamboos, cultivation of, 352; hardy, 316
 Banana, the Abyssinian, 69
 Beans, early French, 180
Beaumontia grandiflora, 298
 Bees, rats as enemies to, 310
 Beetroot cultivation, 242
 Beet, Sugar, industry in Greece, 348
Begonia, a new, from German East Africa, 41; Gloire de Lorraine, 253; Gloire de Lorraine, the seedling of, 285, 317
Begonias, tuberous-rooted, 78
 Belgian nation, gift of properties by King Leopold to the, 250
 Belvoir Castle, an overturned Geantree at, 406, 420
 Benevolent Institution, Gardeners' Royal, 329; Annual Meeting, 40; Bristol Auxiliary, 127
Berberis stenophylla, 204
 Birds building in shrubs and walls, 77
 Birds when nesting, shrubs favoured by, 46
 Blackmore, the late R. D., 58, 73, 384
 Blenheim, 10
 Blossom on wall-trees, protection of fruit, 123
 Bluebell, a bulbiferous, 347
Bocconia cordata, a bed of, 204

BOOKS, NOTICES OF: A Glossary of Botanic terms, with their derivation and accent (*B. D. Jackson*), 346; Agricultural Botany, theoretical and practical (*John Percival, M.A.*), 367; Annales des Sciences Naturelles Botaniques, 12, 85; Anne Pratt's Flowering Plants (*Edward Step*), 9, 138; Botanical Magazine, 26, 90, 154, 232, 297, 364; Bulletin de la Société Française d'Horticulture de Londres, 265, 367; Carnations and Picotees for Garden and Exhibition (*H. W. Weguelin*), 350; Cassell's Pocket Gardener, 314; Chronique Horticole Bi-hebdomadaire, 329; Cyclopædia of American Horticulture (*Prof. Bailey*), 27, 348; Dictionnaire Iconographique

des Orchidées, 2, 81, 130, 242; Flora Capensis, 329; Florilegium Haarlemense, 329; Flowers of the Field (*Rev. C. A. Johns, B.A., F.L.S.*), 203; Fruit Farming for Profit (*Geo. Bunyard*), 26; Fruit Growers' Year Book, 233; Gardening Year Book and Garden Oracle for 1900, 265; Hand-list of tender Dicotyledons in Royal Gardens, Kew, 216; Home and Garden (*Miss Gertrude Jekyll*), 90, 106; Hooker's Icones Plantarum, 329; Icones Selectæ Horti-Thenensis, 106, 201; Il Crisantemo, 347; Illustrations of the Botany of Captain Cook's Voyage round the World in H.M.S. *Endeavour* in 1768-71 (*Sir Jos. Banks, Bt., and others*), 347; Jack and Jill's Journey, &c. (*Phæbe Allen*), 138; Journal of the Royal Horticultural Society, 248; Kew Bulletin, 8; Lawns, &c. (*Sutton & Sons, Reading*), 106; Le Chrysanthème, 58; Lectures on some of the Physical Properties of Soil (*Prof. R. Warington*), 321; Les Plantes de Serre, &c. (*G. Bellair and L. St. Leger*), 187; Les Vieux Arbres de la Normandie (*Henri Gadeau de Kerville*), 5; Lindenias, 18, 178, 242, 322; List of published Names of Plants introduced to cultivation, 1876-1896 (*Kew Bulletin*), additional series, iv., 168; Miniature Gardening (*P. Allen and Dr. Godfrey*), 329; Minnesota Plant Life (*Conway Macmillan*), 203; Mitteilungen der Deutschen Dendrologischen Gesellschaft (*German Dendrology*), 138; Moderne Tafeldekoration (*Otto Wagner*), 153; My Gardener (*H. W. Ward*), 201; Natal Plants (*Medley Wood*), 9, 152; Observations on the Colours of Flowers (*— Hervey*), 81; Ornamental Shrubs (*Lucius Davis*), 366; Planting and Planning Home Grounds (*American*), 260; Publications Received, 10, 27, 41, 55, 74, 90, 122, 140, 186, 254, 266, 304, 314, 330, 348, 385, 405; Queensland Flora, 199; Report of the National Chrysanthemum Society, 249; Revue de l'Horticulture Belge, 9; South African Agriculturists' Year Book for 1900, 281; Surrey's Capital (*J. E. Morris*), 233; Surveying and Arranging Home and School Grounds, 260; The Alpine Flora (*L. Schröter and Prof. Dr. O. Schröter*), 365; The Amateur's Practical Garden Book, &c. (*C. E. Hume and L. H. Bailey*), 366; The Art and Craft of Garden-making (*T. H. Mawson*), 385; The Book of Gardening (ed. by *W. D. Drury*), 246; The Birds of Surrey, 122; The Botanists of Philadelphia, and their work (*J. W. Harshberger*), 150; The Century Book of Gardening, 153, 234; The Chemists' Assistant, 215; The Flora of Ceylon (*Sir Jos. Hooker*), 90; The Garden, 26; The Horticultural Directory and

Year Book for 1900, 26; The Mycetozoa, and some questions which they suggest (*Sir Ed. Fry*), 267; The Nature and work of Plants, &c. (*D. T. Macdougall, Ph. D.*), 366; The New Forestry, or The Continental System adapted to British Woodlands (*Jno. Simpson*), 121, 163; The Potamogetons of the British Isles (*Alfred Fryer*), 121; The Praise of Gardens (*A. F. Sieveking*), 49; The Rosarian's Year Book, 26; The Teaching Botanist, &c. (*W. F. Ganong*), 122; Thompson's Gardeners' Assistant, 347; Transactions of the English Arboricultural Society, 106; Unwin's Chap-book for 1899, 27; Vegetables for exhibition and home consumption (*E. Beckett*), 75; West Indian Bulletin, 201; Who's Who at the War, 202; Xenia Orchidacea, 258

Books, sale of botanical, 282
 Boston, U.S., horticultural hall at, 382
 Botanic Gardens, Padua, 15; at Trinity College, Dublin, 292; the London, 65, 419
 Botanical, exchange club, 365; garden, the, New York, 90; laboratories, at Glasgow, 314; nomenclature, 235

GARDENING UNDER GLASS.*

By W. WATSON, ROYAL GARDENS, KEW.

LAST year we devoted an evening to "The Evolution of the Greenhouse." We found that the first use of glass in the construction of a house for plants was towards the end of the seventeenth century, when structures known as orangeries, with opaque roofs and glass sides, were designed. Such, according to Ray, was the house in the Apothecaries' garden at Chelsea in 1684, and which was heated by a kind of oven. In 1717 a forcing-house for Grapes was erected for the Duke of Rutland at Belvoir Castle, in which glass formed the roof as well as the sides. These structures were heated by means of furnaces built under the floor of the house. This was improved upon by carrying the flue or chimney along the side of the house. Steam was used in 1788, and shortly afterwards hot water was applied to the artificial heating of a plant-house in the Jardin des Plantes, Paris. None of these structures, however, were what we to-day should designate a greenhouse; they were merely sheds with a few extra windows in the sides or roof for the admission of light, their chief use being to protect from the cold of winter such plants as during the summer could be grown in the open air. The earliest form of plant-house constructed wholly of glass supported by sash-bars, was the lean-to, of pent-house shape, some of which are still in existence in old gardens in this country.

From such structures to those of modern design was a great stride. Then glass was expensive and poor; heating arrangements were of a more or less make-shift character,

and the methods of ventilation were of a primitive kind. And yet the gardeners of those days succeeded in growing exceedingly well many plants which, notwithstanding our greatly improved appliances, we either fail with or grow indifferently. This, I think, is to be attributed to a change in the spirit of horticulture, rather than to a falling off in cultural skill. Generally, the improvement in gardening under glass has kept stride with the improvement in appliances, and the skilful cultivator can now produce in a year plants which are not only finer examples as regards finish, but grown in one-half or one-third of the time it took our grandfathers to grow them.

Let us now turn to the principles which govern the cultivation of plants in glasshouses to-day, omitting details which are outside the scope of this paper.

THE STRUCTURE.

Whilst few would deny that the most perfect plant-house is that which admits the maximum amount of light at all times of the year, it is surprising how many overlook that essential when designing plant-houses. We are in this matter too much under the influence of the builder and architect, whose aim and taste are not usually those of the gardener, and who cannot always be made to comprehend the importance of direct sunlight for the growth of plants. The gardener should insist on having houses as nearly as possible wholly of glass. The most perfect house would be a compressed glass bubble, and every inch of opaque material introduced is consequently so much short of perfection. The builder will insert heavy beams, massive iron-work, and useless ornamentation, both outside and inside; and he will assert that they are essential to the safety or finish of the structure. It therefore behoves a gardener to know sufficient of the principles of construction to be able to prevent this overloading of plant-houses with obstructions to light. A house should be designed to satisfy the requirements of the plants at the worst time of the year. We can easily shut out excess of sunlight, but we are powerless to increase it, except by the use of the electric light.

The defects due to the fads and whims of the architect when called upon to design a conservatory were pointed out by Loudon forty years ago in that rich mine of horticultural lore, the *Encyclopedia of Gardening*. He says: "The grand cause of the improvements which have been made in hot-houses may be traced to their being no longer, as formerly, under the control of mansion architects. To civil architecture, as far as respects mechanical and chemical principles, or the laws of the strength and durability of materials, they are certainly subject in common with every description of edifice; but in respect to the principles of design or beauty, the foundation of which we consider to be "fitness for the end in view," they are no more subject to the rules of architecture than is a ship or a fortress; those forms and compositions, fitting and beautiful for the habitation of man or animals, being unfitting, and therefore not beautiful in a habitation for plants. Such, however, is the force of habit and professional bias, that it is not easy to convince architects of this truth. Fitness for the end in view, we repeat, is the basis of all beauty in works of use, and therefore the taste of architects so applied may safely be pronounced as radically wrong."

This principle insisted upon in the passage quoted, viz., "fitness for the end in view," is

of fundamental importance in the construction of plant-houses. If conservatories are built mainly to add to the architectural finish of residences, first-class gardening must be set down as of only secondary importance. These often dark, dismal structures are generally unsightly inside from every point of view; and whilst some gardeners succeed in making them passably picturesque by the use of a few plants which are good-natured enough to grow anywhere, others give them up as hopeless. I would never build such a house as No. 1, or the central part of the Winter Garden at Kew; for, although the plants they contain live, and more or less grow, the same plants would thrive twenty times better in houses better adapted for gardening. Very large houses have what we may term an imposing effect; but, speaking after an experience of twenty years in trying to grow plants in them, I may say they are heartbreaking to the gardener who desires to see his plants healthy and happy. The number of plants sacrificed in trying to keep large structures furnished and interesting is far greater than most people believe.

This brings me to the second fundamental principle of greenhouse construction, viz., height. Do not build a foot higher than the plants require. It is unnecessary to insist here on the importance of keeping plants in houses as near the roof-glass as possible, as every gardener knows that healthy, vigorous growth is in inverse ratio as the distance of the plant from the glass. Market growers, keenly alive to this, build their houses low. The height of the ridge is decided by the width of the house: the angle of the roof, from 30 to 45 degrees, calculated to admit the maximum of sunlight and heat, and to throw off water, snow, &c., is now generally known, and acted upon by builders.

The quality of glass used for plant-houses should be strong, and good; 21 oz. crown glass is used at Kew. Poor glass not only breaks easily, but it often burns or scalds the plants by focussing through defects the heat-rays of the sun. The sash-bars should be no wider than stability requires. Except in very special cases, all houses should be built at right angles to the south; houses running from south to north, as so many are at Kew, are a mistake.

VENTILATION.

The ventilator has two distinct uses in the plant-house—first, to supply fresh air to the plants; second, to regulate the temperature. Many plant-houses are so loosely put together that a healthy circulation of air takes place when they are closed. A well-built house, properly glazed, is, on the contrary, as close as a corked bottle. A regular supply of fresh air is as necessary to the health of plants as a regular supply of fresh water. There are various efficient methods for ensuring this at all seasons of the year, but unfortunately they are too often neglected. Modern cultivators avoid opening the top ventilators except when the conditions render it safe. When the difference in temperature between the air outside and that inside is extreme, to open the top ventilators would be unwise, the outrush of the warm air, and the inrush of cold air, being most hurtful. In the case of plants which easily flag, the ill-effects are soon evident, and mischief is prevented by closing the ventilators; but where the plants are more rigid, the injury is not so immediately evident, although it occurs just the same. Never open top ventilators, therefore, except when the air outside is such

* From a Paper read at the Kew Mutual Improvement Society.

as will not injure the plants when admitted in quantity.

"The drain of moisture by the escape of heated air is much greater than is generally imagined. The capacity of air for moisture depends upon its temperature, and increases with it in a rapid ratio. It is doubled between 44° and 66°. The consequence is, that every cubic foot of air which escapes at the latter temperature carries off with it twice as much moisture as it brought in. When the difference of temperature is greater, the drain becomes greater also; air entering at 44° and escaping at 80° carries off three times as much moisture as it brought" (Rogers).

The best form of roof-ventilator is the lantern or short hinged top-sash. Sliding-sashes are antiquated, and have many defects. Bottom-ventilation should be afforded in moderation at all times, and the air should be admitted in such a way as will ensure its being warmed before it reaches the plants. Experienced Orchid-growers leave the bottom ventilators of cool-houses wide open all night during summer, and in moist weather.

It is in the manipulation of the ventilators, blinds, and heating-apparatus, that the careful gardener often obtains his most marked successes. All the appliances may be of the most approved kinds; but if carelessness in these essential factors of healthy plant-growth is practised, failure must inevitably result. Generally a plant-house should be ventilated on precisely the same lines as a man's house, avoiding rushes of air, sudden changes and draughts, at the same time admitting sufficient to maintain buoyancy and freshness.

SHADING.

There is, generally speaking, a great deal more shading done than the plants require or like. Too often this is due to laziness. Under the influence of sunshine, plants lose their moisture quicker, and consequently they require watering more frequently than when shaded. The blinds are let down in the morning when the sun is powerful, and are allowed to remain down till evening, even although the sun may have been obscured for hours during the day. Plants will grow rapidly even in feeble light, but they are imperfectly nourished, and will break down eventually, either by dropping their flower-buds, losing their leaves, or a portion of the latter may become brown or spotted. Light is life to the plants, and although it may injure some by its intensity, as a rule the brighter it is the better the growth will be. With bright sunshine, the temperature of the house may be allowed to rise correspondingly; more light, more heat, is a safe axiom in indoor gardening.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

THE November number commences a new series. Henceforth the publication will only be published at intervals of two months. The collection of plates is so handy for reference, the execution of the plates so free from exaggeration, and the text so authentic, that we earnestly hope for a prosperous future for this useful publication. The plants figured in the last number are:—*Anguloa Clowesii*, Ldl.; *Cattleya Rex*, O'Brien; *C. Atlanta inversa*, Hort.; *Cochlidium rosea*, Benth.; *Dendrobium Vitoria Reginae*, Lohr.; *Epidendrum atropurpureum* v. *longilabre*, Cogn.; *E. xanthinum*,

Ldl.; *Grammatophyllum Rumphianum*, Miq.; *Lælia xanthina*, Ldl.; *Maxillaria striata*, Rolfe; *Mormodes Ocanne*, Lind. et Rehb. f.; *M. Buccinator*, Ldl. (forma); *M. B. v. citrinum*, Hort.

EULOPHIA LUBBERSIANA.

Under this name the *Revue de l'Horticulture Belge et Etrangère* for the present month gives the description of a new species from the Congo. The leaves are described as very beautiful, pearly-white, spotted with black and with green blotches. The flowers are less remarkable. A coloured illustration will be given in the next issue.

ADVENTITIOUS GROWTH ON CYPRIPIEDUM.

Mr. G. W. Cummins, Balmedie Gardens, Aberdeen, kindly forwards a flower-stem with seed-capsule of *Cypripedium Lathamianum*, bearing at the base of the ovary a tiny plant which might easily be mistaken for a seedling. Examination with a powerful lens, however, shows that the growth has actual contact with the flower-stem of the parent-plant, and that it is an adventitious process therefrom of precisely the same nature as similar growths often found on the flower-spikes, and sometimes on the roots, of *Phalenopsis* and other Orchids. In *Cypripediums* we have noticed similar growths on several occasions, and in most cases when the ovary had perished before maturity, or when the flower-stem was dying from the base.

CABBAGES.

MOST gardeners will admit that Coleworts have no equal as regards goodness of quality and mild flavour among Cabbages, and the best of them is undoubtedly the Rosette variety. These Coleworts are in use in the winter, and onwards till late in the spring months. The ordinary Cabbages, if planted in the month of October make slow progress until the end of the month of February, and then growth becomes more rapid; but that of the Coleworts is completed in mild winters in three months from the time of planting. It frequently happens that rapid growth in vegetables does not tend to capability to withstand frost, and Coleworts are sometimes greatly injured in this way, the heads expanding, and making the plant more vulnerable to wet and frost. Seeing how well such winter Cabbages as the St. John's Day, Christmas Drumhead, and Sutton's Favourite stand severe weather, it occurred to me that a good type of the Rosette Colewort, if crossed with one of these varieties, would afford a hardier Cabbage of good quality. One of this race was figured and described in the *Gardeners' Chronicle* on Dec. 16, under the name St. Martin, a variety which I think will make its way in gardens. Some gardeners complain that it lacks size, good eating quality being too often thought of little moment. I have named Sutton's Favourite as a distinct winter variety, although it is generally less grown at that season than in spring to come on in summer; still, it is a fine autumn and winter variety, very dwarf, with a solid small heart, remaining good when fully grown for a longer period of time than many others. This remark applies to Cabbages raised from summer or early autumn sowings, for mid-winter supplies. In regard to hardiness, I know of no other variety that is the superior of Christmas Drumhead, which is a hard compact Cabbage, but little influenced by the weather. It may be thought that what are termed spring or early summer Cabbages, if sown at the right season, would do for use in the autumn, but such is not the case as regards these varieties, as quite a different kind of growth takes place at that season that renders them less useful than at their proper season. For many years before I obtained the true Christmas Drumhead from seed, from Mr. Bunyard of Maidstone, I grew Winnigstadt, an old continental variety, possessing a short stem and large conical head, and leaves of a glaucous hue, like those of the Broccoli or Cauliflower. It is a very hardy Cabbage. The type, when first sent

out, was a dwarfier plant than those now in commerce, and the head was smaller. I mention the Winnigstadt for its hardiness, and its value as an autumn and winter Cabbage, the seed being sown in the month of May. I have sown winter varieties of Cabbage in March for summer use, and they seemed to be less subject to attacks from caterpillars than the spring varieties, and bolting; all the same, their flavour is not to be compared to plants grown under better conditions. I need not say anything here about the cultivation of Cabbages beyond advising gardeners to plant them rather closely, say 15 to 18 inches between the rows, and to make two sowings, one early in the month of May for the autumn supply, another a month to six weeks later for winter use. G. Wythes.

RENANTHERA LOWI.

IN fig. 1 is illustrated a remarkable specimen of this Orchid as it bloomed in October in Mrs. Nelson's Garden at Salisbury Green, Edinburgh. To Mr. Alex. Laing, who has charge of these gardens, we are indebted for the photograph, and for the following information concerning this plant, in the cultivation of which he has been so successful:—

"The plant is 3 feet high, has twenty-seven leaves, and bore four flower-spikes, supporting 116 blooms. The longest spike was 6 feet 6 inches in length. A remarkable characteristic of this species, well known to Orchidists, is its production of dimorphous flowers. On two of the spikes there were the usual two blossoms at the base of the spike, different in shape and colour from all the others on the same spike, while at the base of the other two spikes there were one and three respectively of the yellow and crimson spotted flowers. The plant has been grown in a house having a temperature of 60° to 65° in winter, and 65° to 70° in summer. Being a native of Borneo, the plant would doubtless thrive, and perhaps flower more freely if grown in a higher temperature with the necessary moisture."

NOVELTIES OF 1899.

AGAIN the season has come round for a review of the new plants raised or introduced to our gardens during the year just closed, especially of those plants Certificated during 1899 by the Royal Horticultural Society. As usual, in addition to plants actually new, there are others that have been little known, or that have only now shown their true characteristics.

Although few new departures or fresh sections of exceptional interest have appeared during the year, either among importations or home-raised hybrids, there is abundant evidence that great progress has been made, more especially by the hybridist, whose work was so interestingly set forth at the Hybridisation Conference of the Royal Horticultural Society in July, and in the notes accompanying the portraits of the leading hybridists published in the *Gardeners' Chronicle*.

It is interesting to disclose by this annual review that the specialists of old are true to their selections, the same names appearing in conjunction with the same classes of plants year after year.

ORCHIDS

especially show the constancy of those who cultivate them. Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), still takes the lead among the lovers of good things of all classes, and is foremost among the few who treasure pretty botanical species. During the year some few good advances have appeared among the Burford hybrid Calanthes, *Dendrobiums*, and other genera; the certificated plants from Burford, including *Cypripedium* × *Argo-Morganii* and *C. × Hera Euryades*, the latter being specially fine; *Dendrobium* × *Wiganæ xanthochilum*, a bright yellow flower, with rich purple centre; *D. × Euterpe*, a stately hybrid, with very showy flowers; *D. × Nestor*, originally raised by Chas. Winn, Esq.; *Thunia Bensoniæ superba*, a large rose-purple flower; *Masdevallia*

× *Curlei*, M. × *Shuttyanana*, Chamberlain's variety (different in colour to the one raised at Burford), and M. × *falcata*.

Among fine varieties of species credited to Sir Trevor Lawrence during the year are the Burford form of *Masdevallia ignea* Boddarta; *Cattleya Mossii* Lawrence, and C. M. *Goossensiana*, two

anum, The Dell variety; O. × *Cookeanum* and O. × *Coradinei* mirabile, all well worthy of his fine collection.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), a great admirer of good Orchids, contributes to the novelties of the past year the fine white *Cattleya Mendeli*

The Rt. Hon. JOSEPH CHAMBERLAIN (gr., Mr. J. Smith), has on several occasions sent fine examples of the hybrid Orchids raised at Highbury to the meetings of the Royal Horticultural Society. The best during the year were the bright reddish-scarlet *Sophro-Cattleya* × *Chamberlaini* var. *triumphans*, and the charming hybrid of *Cattleya maxima*—C. × *Mrs. Endicott*?

JOHN LEEMANN, Esq., of Heaton Mersey (gr., Mr. Edge), one of our most enthusiastic collectors, showed us *Odontoglossum crispum* Mrs. John Leemann, O. × *Coradinei*, West Bank House variety; the noble *Cattleya labiata* Sir George White, the brilliantly coloured C. l. *Peetersiana* superba, the delicately-tinted *Cattleya* × *Isabella*, *Cypripedium* × *Helvetia*, and a number of other new hybrids which have been flowered by him for the first time in 1899.

ELIJAH ASHWORTH, Esq., of Wilmalaw (gr., Mr. Edge), has *Cattleya Trianaei* Ernest Ashworth, *Cypripedium insigne*, Harefield Hall variety; *Odontoglossum crispum* Ashworthianum, O. × *Adrianae* Ashworthianum, and other good things.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray), has recorded as his best of the year the remarkable dark ruby-red *Calanthe* × *Oakwood Ruby*, a triumph of cross-breeding and selection; the fine *Phaius* × *Phoebe*, *Dendrobium* × *Cybele*, *Oakwood* variety; and *Cypripedium* × *Schofieldianum* superbum.

Of *Odontoglossum* specialists, W. THOMPSON, Esq., Walton Grange, Stone (gr., Mr. W. Stevens), succeeded in getting Certificates for *Odontoglossum crispum* Duke of York, O. c. *Daphne*, O. c. *Arthur Briaco*, O. × *Coradinei* expansum, O. × *Loochristyense* Canary Bird, and O. *triumphans* King Alfred.

DE B. CRAWSHAY, Esq., Sevenoaks (gr., Mr. S. Cooke), follows in the same direction with *Odontoglossum crispum* Seraphim, O. c. *Raymond Crawshay*, O. × *Andersonianum* Mrs. De B. Crawshay, O. × *A. Raymond Crawshay*, O. × *Coradinei* *Crawshayanum*, O. × *Ruckerianum* *Crawshayanum*, *Lælia anceps* *Rosefieldensis*, and L. a. *Amesiana*, *Crawshay's* var., whose merits obtained acknowledgment during the year.

H. S. LEON, Esq., Bletchley Park (gr., Mr. Hialop), scores with his *Cattleya* × *Maggie Raphael*, the finest yellow-petalled hybrid of the year; *Lælio-Cattleya* × *callistoglossa*, Leon's variety; L. C. × *Preciosa* Hialopi, and some others.

G. W. LAW-SCHOFIELD, Esq., New-Hall-Hey (gr., Mr. Shill), produced the fine *Cypripedium* × *Shillianum*, which would have taken the Medal for the best hybrid Orchid of the year, but that it had been put out by having been previously exhibited; C. × *conco-callosum*, *Lælia purpurata* Annie Louise, &c.

A. WARBURTON, Esq., Haslingden, was given recognition for *Lælia tenebrosa* Victor Warburton, a fine form of the L. t. *Walton Grange* class; and *Dendrobium* × *Clio Vine House* var.

WALTER COBB, Esq., Tunbridge Wells (gr., Mr. J. Howe), showed the fine *Odontoglossum crispum* *Basano*, *Miltonia vexillaria dulcotensis*, *Odontoglossum triumphans*, *Dulcote* var., and *Cypripedium bellatulum*, *Dulcote* var.

J. GURNEY-FOWLER, Esq., Glebelands, South Woodford (gr., Mr. J. Davis), showed *Cypripedium* × *Miss Louisa Fowler*, *Cattleya Eldorado*, *Glebelands* variety; C. *Mossii* *Victoria*, and *Cypripedium insigne* *Fowlerianum*, all good.

Other fine plants shown by amateurs in 1899, and Certificated, were *Cattleya Dowiana*, Little's variety, of H. LITTLE, Esq.; *Cattleya Harrisoniana* alba, and *Lælio-Cattleya* × *Adolphus*, of the Rev. Mr. PAYNTER, Guildford; *Cattleya labiata* *Gilmouriae*, and the beautiful *Lælio-Cattleya* × *Dominiana* *Fire King*, of Mrs. BRIGGS-BURY; *Cattleya intermedia*, *Rosslyn* variety, and *Odontoglossum crispum*, *Rosslyn* variety, of H. T. PITT, Esq.; *Cattleya labiata*, and the fine white C. *labiata* Mrs. R. I. MEASURES, of R. I. MEASURES, Esq. (gr., Mr. H. J. Chapman); the pure white *Cattleya Ludemanniae* alba, of W. DUCKWORTH, Esq.; Mr.

FIG. 1.—A FINELY-FLOWERED SPECIMEN OF *RENANTHERA LOWII*, IN THE GARDEN OF MRS. NELSON, SALISBURY GREEN, EDINBURGH.

NUMBER OF FLOWERS UPON THE PLANT 116. (SEE P. 2.)

very distinct and desirable additions to the showy forms of C. *labiata*; C. *Mendeli* *Burford* variety; *Odontoglossum crispum* *purpurascens*, a well-marked fine variation; and the bright yellow *Sophranitis grandiflora* *Rossiteriana*.

BARON SIR H. SCHRODER, The Dell, Staines (gr., Mr. H. Ballantine), showed his continued appreciation of the genus *Odontoglossum*, so well grown and so richly represented at The Dell, with O. *luteo-purpureum*, The Dell variety; O. *Wilcke-*

albesens, the handsome C. *Trianaei* Amy Wigan, the richly-coloured *Lælio-Cattleya* × *Wiganæ*, a splendid hybrid of the L. C. *Dominiana* class; L. C. × *superbo-elegans*; *Lælia tenebrosa gigantea*; the rare natural hybrid *Cattleya* × *Whitei*, Wigan's variety; *Cypripedium Stonei* candidum, *Phalænopsis Sanderiana*, Wigan's variety, the most perfect in form of any of the rose-pink *Phalænopsis*; *Odontoglossum* × *Adrianæ* Lady Wigan, and O. × *Harryanum* *crispum*

T. W. THORNTON'S fine hybrid *Cattleya* × *weedenensis*, and *C.* × *Euphrasia*, Thornton's variety; Lord ROTHSCHILD'S *Schomburgkia* *Lyonsii*, and *Stauropsis* *lioschiloides* var., neither new as species, but rarely seen in such good form; and *Vanda* *terres*, Gunnersbury Park variety, of LEOPOLD DE ROTHSCHILD, Esq.

The *Masdevallia* × *Rushtoni* of CAPTAIN HINCKES is worthy of that *Masdevallia* hybridist; *Cattleya* *Mossiae* *gloriosa*, and *Laelio-Cattleya* × *Aphrodite* *Ruth*, of J. RUTHERFORD, Esq., surpass former varieties in each class; and *Odontoglossum* *crispum* *Purity*, of T. B. HAYWOOD, Esq.; *Cattleya* × *Kienastiana* *Aurora*, and *C.* × *elator* of C. L. N. INGRAM, Esq.; and *Cypripedium* × *Milo*, *Westonbirt* variety, and *Odontoglossum* × *Andersonianum*, *Westonbirt* variety, of CAPTAIN HOLFORD, are valuable acquisitions of the year.

NURSEYMEN'S PRODUCTIONS.

Messrs. JAS. VEITCH & SONS, as usual, hold the record for having flowered the greatest number and the best hybrids of the year. The season was opened by them in January with the grand *Angraecum* × *Veitchi*, and the remarkable and interesting *Epi-Cattleya* × *Mrs. James O'Brien*, both of which received Awards on January 10 at the Royal Horticultural Society. On July 25 they exhibited *Sophr-Cattleya* × *Queen Empress*, one of the finest hybrids ever raised, and a distinct reward for Messrs. Veitch's labours to produce a hybrid of the size of the larger *Cattleyas*, but with the dark scarlet colour of some of the forms of *Sophrontis* *grandiflora*. *Sophr-Laelia* × *lata* *superba* is another step in the same direction, and each of the following exhibits show good results of the work done by Messrs. Veitch and their diligent lieutenant, Mr. John Seden. All have received Awards in 1899: *Cattleya* *labiata* *alba* *Prince of Wales*, C. Gaskelliana *formosa*, C. × *Princess*, C. × *vestalis*, *Cypripedium* × *Captain Holford*, C. × *Hera Euryades* *splendens*, C. × *Orion*, *Disa* × *Clio* *superba*, *Epidendrum* × *elegantulum* *luteum*, E. × *Langleyense* *superba*, *Epi-Laelia* × *Charlesworthi*, *Laelia* × *Mrs. Gratrix*, *Laelio-Cattleya* × *Bryan Duches* of *York*, L.-C. × *Aphrodite* *eximia*, L.-C. × *Lucilia*, L.-C. *Wellisiana* *ignescens*, *Phaio-Calanthe* × *Niobe*, *Phalenopsis* × *Cassandra*, P. × *Hermione*, and P. × *Mrs. J. H. Veitch*.

MESSRS. F. SANDER & Co. have rendered great service to horticulture by the introduction of the remarkable *Dendrobium* *spectabile*, figured on p. 491 in last week's issue, and now flowering in several collections; also, the elegant Himalayan *Cymbidium* *Gammieanum*; and by the production of some good hybrid *Cypripediums* and others, among which should be mentioned the pretty *Zygo-Colax* × *Ameisiana*, and *Laelio-Cattleya* *Wilsoniae*, a pretty addition to the medium-sized hybrids.

Messrs. HUGH LOW & Co. secured awards for *Cattleya* *Mendeli* *Perfection*; *C. Mossiae* *Beauty of Bush Hill*, C. *Trianae* *Ameisiana*, and *Odontoglossum* × *Andersonianum* *grandiflorum*, all showy novelties.

Messrs. CHARLESWORTH & Co., in their hybrid of *C.* *Charlesworthi*, named *C.* × *Lord Roberts*, produced one of the richest-coloured *Cypripediums* yet seen; and other trade establishments have supplied important new varieties and hybrids.

CONTINENTAL EXHIBITS

of Orchids have been more than usually numerous and good during the past year.

Messrs. LINDEN, l'Horticole Coloniale, Brussels, having among their best *Cypripedium* × *Wiertzianum*, *Cattleya* *Trianae* *Memoria Lindeni*, *Odontoglossum* *crispum* *Miss Linden*, *Miltonia* *vexillaria* *Lindeniae*, *Oncidium* *varicosum* *Lindenii*, O. *Forbesii* *Moortebeekense*, O. *F. castaneum*, and others.

M. JULES HYE-LEYSSEN, Ghent, secured awards in England for *Cypripedium* × *Surprise*, C. × *Talisman*, *Odontoglossum* *crispum* *Sultan*, O. c. *Etoile du Congo*, O. c. *Franz Masereel*, O. × *excellens* *Hyeaenum*, O. × *e. nobilius*, O. *Halli-Lafresseanum*, *Laelio-Cattleya* × *Myra Etoile d'Or*, and the fine L.-C. × *Madame Albert Hye*

M. CHAS. MARON, Brunoy, France, one of the most successful of continental Orchid hybridists, has a good record with *Laelio-Cattleya* × *Ernesti* *Princess Olga*, the grand, bright yellow hybrid which has now passed into the collection of Norman C. Cookson, Esq.; L.-C. × *Digbyano* - *Mendeli* *Imperatrice de Russe*, L.-C. × *Callistoglossa* *J. Leemann*, L.-C. × *Martineti*, L.-C. × *Duvaliana*, and other good hybrid *Laelio-Cattleyas* shown at the Hybrid Conference in July.

The following novel or rare Orchids were illustrated in the *Gardeners' Chronicle* in 1899: -

- Angraecum* × *Veitchi*, January 21, p. 35.
- Bartholina* *pectinata*, July 1, p. 15.
- Bulbophyllum* *mandibulare*, October 14, p. 293.
- Cattleya* × *Maggie Raphael*, December 30, p. 482.
- Cypripedium* × *Hera Euryades*, December 30, p. 483.
- Cypripedium* × *Milo*, *Westonbirt* var., December 2, p. 413.
- Cypripedium* × *Olivia*, November 4, p. 239.
- Dendrobium* × *Cybele*, *Oakwood* variety, April 29, p. 259.
- Dendrobium* *spectabile*, December 30, p. 491.
- Epi-Cattleya* × *Mrs. James O'Brien*, January 21, p. 37.
- Laelio-Cattleya* × *Ernesti*, *Princess Olga*, March 11, p. 149.
- Odontoglossum* × *Cookeanum*, March 11, p. 155.
- Odontoglossum* × *Coradinei*, *West Bank House* var., May 20, p. 315.
- Odontoglossum* × *Adrianae*, *Lady Wigan*, April 29, p. 258.
- Odontoglossum* *crispum* *Daphne*, October 21, p. 307.
- Odontoglossum* *crispum* *Duke of York*, March 25, p. 179.
- Odontoglossum* *crispum* *Mrs. John Leemann*, March 25, p. 187.
- Odontoglossum* *crispum* *Moortebeekense*, December 9, p. 421.
- Odontoglossum* × *Harryano* - *crispum*, July 22, p. 67.
- Odontoglossum* × *Wilckeanum* *pallens*, March 25, p. 185.
- Phalenopsis* × *Mrs. J. H. Veitch*, February 25, p. 114.
- Phaius* × (*Manni* × *tuberculosis*), February 25, p. 115.
- Schomburgkia* *Lyonsii*, September 9, p. 203.
- Selenipedium* × *macrochilum* *giganteum*, Supplement, June 3.
- Sophr-Cattleya* × *Chamberlainiana* var. *triumphans*, December 16, p. 446.
- Sophr-Cattleya* × *Queen Empress*, August 5, p. 113.
- Zygo-Batemaniana* × *Mastersii*, February 18, p. 99.
- Zygopetalum* *Gairianum*, November 25, p. 401.

(To be continued.)

CULTURAL MEMORANDA.

PERENNIAL GAILLARDIAS.

THE Gaillardias are invaluable for the decoration of the flower-garden or the herbaceous border. They flower abundantly in summer and autumn, and last long upon the plant or when cut and placed in vases. There are few species, but many garden hybrids. *G. aristata* has yielded numerous varieties that have brightly coloured flowers of varied shades, and they are all vigorous growers.

In some localities the Gaillardias are not perfectly hardy, for a winter of usual severity will kill the plants. But this rarely occurs upon light or dry soils. The Gaillardias are peculiarly adapted for grouping, and by this system the characteristics of the plants are best displayed. A method I have adopted with success is to save some seed annually from the best marked flowers. The seed is sown in boxes as soon as ripe, and quickly germinates. The seedlings are pricked off into other boxes containing good friable soil, and kept in cold frames during the winter months. In March or earl

April they are transferred to their permanent position out-of-doors, the soil having been previously prepared by trenching, and the incorporation of manure and wood ashes or charred refuse.

With ordinary care the plants will be strong at planting time, and will grow apace if given water should the weather be dry. A little manure-water may be given alternately with clear water, or the plants may with advantage be mulched with manure, which will also help to conserve the moisture. Plants thus treated will yield a profusion of exquisite flowers during late summer, and well on into the autumn.

Another mode of raising seedlings is to purchase seed in February and to grow them on without a check until the weather is favourable for transplanting them to the open ground, and provided that every care and attention be given the plants excellent results may be expected. The old plants that have withstood the winter will naturally flower much earlier than seedlings, and will thus prolong the season of bloom. Close attention must be given to keeping the plants secured in an upright position from the time they commence to produce flowers. Four stakes placed round each plant with a string passed round at intervals will answer well, and will ensure the long flower-stems keeping straight for use in vases. H. T. Martin, *Stoneleigh*.

MARKET GARDENING.

HYDRANGEAS.—These are grown in large quantities for market, the various growers treating them differently, and it is difficult to say which is the best and most economic method. At one time it was only the dwarf plants in 48-size pots that found much favour, but since floral decorations have been carried out on a much larger scale and in different styles to what they were formerly, taller and larger plants are in demand.

The dwarf plants may be grown by taking cuttings towards the end of August, but these must be taken from strong plants with well matured growths. In favoured districts where they withstand the winter out of doors, the best cuttings are obtained from those planted out in the open. These will root freely on a hot-bed. They should be put in singly in small pots, and may be potted on into 48-size pots as soon as well rooted, after which they should be well exposed and kept rather dry than otherwise. If they are well ripened a slight frost will do no harm, but it is safer to afford protection early.

Another method is to propagate from the young shoots early in the spring. When they are forced, there are generally plenty of good cuttings to be had from side shoots or those which fail to flower. These cuttings must be as short as it is possible to get them, and though they require to be struck in heat, they must be removed therefrom before they start into new growth; they should be potted singly, and given plenty of room. They require the protection of a frame during the earlier stages, but after they are well established they should be stood out in the open, where they get all the sun and air possible. Some of the earliest struck plants may be stopped, and will then make two or three breaks in time to set their buds.

A good loamy compost should be used, and the firmer they are potted the better; they root through quicker in a rich loose compost, but they do not make such short sturdy growth as those potted firmly. Plants with from three to five large heads of bloom may be grown in 48-size pots, but they require to be well fed with manure after the flower heads begin to develop. In forcing, the great thing is to give plenty of light and air. Too much artificial heat in dull damp weather should be avoided, otherwise the plants will run up tall and thin. With bright sunny weather plenty of heat may be given if it is desirable to hurry them on, but those grown in a moderate temperature are the most satisfactory. The above remarks apply to *H. Hortensia* and its variety *Otakas*.

Thomas Hogg, the white variety, is also a favourite, but is of more slender growth and has smaller heads of bloom. Two-year-old plants of this are the most satisfactory, but fairly good plants may be grown in one season if propagated early and stopped so as to get three or more breaks. Older plants will produce a number of shoots, but these should be thinned out, saving the shortest and strongest shoots. Plants in 48's will carry from five to seven heads of bloom, and those in 32's from eight to twelve, or even more, but a limited number of larger heads of bloom are, perhaps, more desirable. A. H.

PREPARING CUCUMBER PLANTS AND THE HOUSES TO PLANT THEM IN.—The first step to be taken in this direction is to wash the glass and woodwork inside of all houses intended to be planted with Cucumbers. Soft-soapy water, into which a little petroleum—say, a wineglass to two gallons—has been poured, should be used not only as a means of more effectively cleansing the glass and woodwork, but also of destroying any insects or their larvae that may be located between the glass and wood or the latter and the brickwork; afterwards washing the whole of the glass and woodwork with clean water, delivered from syringe or hose. This done, wash the brickwork with hot limewash.

Attention should next be directed to the preparation of the soil, and the formation of hillocks at intervals of 2 feet, and about 1 foot from the walls, on either side. Assuming that the soil used for planting the young plants of Cucumbers last January was new, no hesitation need be felt in using it again, incorporated with a like complement of peat-manure as a rooting and sustaining medium for setting out young plants in towards the end of January next. Therefore, all that is necessary to do is to level the old ridges well back towards the central path, picking out all roots—Cucumber-roots—in the process of turning over the soil. This done, wheel in some of the above-mentioned manure, or any other kind of short manure received in a state of fermentation, tipping a barrowful of this on the levelled ridges on either side the pathway, at intervals of about 3 feet from centre to centre. Afterwards mix the soil and manure well together into conveniently-sized heaps until required for use—first to form the hillocks on which to set the plants, and subsequently to add a layer thereto a few inches thick as the roots push through sides of the mounds, making additional top-dressings until the intervening spaces are made level with the tops of the mounds in which the plants are growing. Before making the hillocks, insert sticks in the soil, at 2 feet apart, the entire length of the house, and at about 1 foot from the walls on either side. Make the mounds about 16 inches deep at the apex and 2 feet wide at the base; the sticks indicating the positions of the plants should be secured to the first wire of the trellis to which to train the young plants when planted. Meanwhile, the seeds should be sown singly in 3-inch pots, a little more than half filled with some of the warm compost mentioned above, covering with a little of the same, and pressing it gently together with the hand. Stand the pots on a stage made over the hot-water pipes, and cover them with squares of glass, if at hand, to hasten the process of germination; removing the glass before the young plants come in contact with it. Fill the pots up to the rims with the same description of soil as the little plants are growing in, as a top-dressing, pressing it gently about them so as not to touch the stems, which in this sappy stage of growth are very susceptible to injury from the slightest pressure. When the plants have attained to a height of about 6 inches, and before the roots become matted in the pots, they should be either transferred to the mounds or shifted into 6-inch pots, using the same kind of compost as before, making this moderately firm in potting. Return the plants to their former position. Put a small stick to each plant for support, and water with tepid water to settle the soil about the roots.

In about two weeks' time these plants will be

ready for planting on the individual mounds, burying therein the same depth as they were in the pots, and pressing the soil well about the balls of earth and roots in planting, afterwards applying tepid water to settle the soil. Plants thus raised and planted in a warm, rich compost, in houses in which a minimum temperature of from 65° to 70° is maintained, necessarily make a rapid and satisfactory growth, a genial, moist atmosphere being observed in the houses so planted from beginning to end of the plants' growth. The fact of having a sufficient quantity of rich, warm soil in each house

FIG. 2.—TOMATO LISTER'S PROLIFIC.

wherewith to top-dress the hillocks as soon as the roots show through the sides of same is of the utmost importance in connection with securing weighty crops of high-quality fruit. The Rochford variety of Cucumber is the best to grow for market purposes.

TRAINING.—When the plants have reached the third or fourth wire of the trellis, they should be stopped, pinching the lateral or side growths at 1 foot, in order to hasten the development of fruit sufficiently to keep the shoots within legitimate bounds; and with this object all superfluous growths should be kept persistently removed. The object should be to cover the trellis thinly rather than thickly with short-jointed, fruitful growths in as short a time as possible. As a rule, well-cared-for plants, which are carrying heavy crops of crisp

fruit in various stages of growth, will not evince much disposition to make superfluous growth. Heavy crops of any kind of fruit are the best correctives of exuberant growth. H. W. Ward.

TOMATO, LISTER'S PROLIFIC.

"WITH brush and paint the artist can the landscape reproduce with pleasing correctness to the eye." Thus the poet. But very different is it with the gardener who, by chance or perseverance, hits upon some uncommonly fine and rare specimen of fruit, flower, or vegetable, in which he finds an all-absorbing pleasure in watching and tending. It would thus be my endeavour to sound the praises and describe the origin of one fine variety of the Tomato. I chanced to receive several packets of seeds from an American gentleman some years ago, which I gave to Mr. Lister, the nurseryman at Rothsay, N.B. After some time spent in testing and cross-fertilisation, Mr. Lister has been rewarded by a variety which calls for special mention. The new comer is sturdy, close jointed, a prolific bearer, and good for either early or late cropping. The fruits average six to the pound avoirdupois, are of a high colour, smooth and round, the flesh solid and of fine flavour. A. McLean, Curling Hall, Largs.

[Our illustration (fig. 2) taken from a photograph kindly sent by the writer of the note, quite confirms his statements in regard to the cropping capabilities of the variety, and the form of the fruit.]

BOOK NOTICE.

LES VIEUX ARBRES DE LA NORMANDIE, fasc. iv., par Henri Gadeau de Kerville. (Baillière et Fils, 19, Rue Hautefeuille, Paris.)

THIS is the work, or a continuation of the work, of an active and acute naturalist. It comprises photographic representations of twenty trees growing in Normandy, together with full details of their locality, identification, and dimensions. Among them there are several Yews, Poplars, Oaks, Beeches, and Limes. The most interesting of these to the English reader is, perhaps, the Mistle-bearing Oak, represented at tabb. xiv. et xv. This tree is growing at Isigny le Buat (Manche); the tree has a girth of 5 m. 37 at one metre from the soil, its height being between 17 and 18 metres. The photograph shows as many as forty tufts of Mistle on this tree. The author devotes a separate section to the Mistle-bearing Oaks of Normandy, from which it appears that the occurrence of this parasite on the Oak is nearly as rare in Normandy as it is in England, for the author only cites five instances.

CHRISTMAS ROSES.

Few flowers are more heartily welcomed than these, and perhaps none yield a fuller harvest with less trouble and expense when and where the plants are treated with due care and foresight. A rich loamy soil, verging into clay rather than to sand, suits them best, and should such soil need lightening or enriching, few ameliorators prove more congenial to the plants than liberal additions of leaf-mould, hot-bed or well-rotted farmyard-manure. The site and soil should be more or less shady, cool, and moist, though thoroughly well drained, and under no circumstances exposed to flooding or saturation with stagnant water.

Though for their size the Christmas Roses can hardly be called groes-rooting plants, yet under liberal culture they require a little good soil, two or more feet in depth, to do justice to their fine leaves and crowded crowns of blooms. Various modes of culture have been recommended, those based on a maximum measure of preparation and a minimum of future interference being generally the more successful.

They may be readily multiplied by division of the root-stocks, which, however, should never be parted with a knife or spade, but the whole mass should be lifted, and each separate crown or clump of crowns pulled apart carefully without destroying, breaking, or bruising the roots. The best time or state for propagation or removal to their quarters is shortly after the blooms fade. In the interregnum between the fading or finishing of the flowers and the starting of the leaves into vigorous growth, the roots may be transplanted with the least possible check or injury.

Where quantities of Christmas Rose flowers or plants are required for decorative purposes at Christmas time or early in the new year, it is well to grow a large stock of plants in a variety of sites and aspects. The distance between the crowns should be partly controlled by size, soil, purposes for which the plants are required, &c. The distances between the crowns or groups of crowns may range from a foot to a yard. For many purposes from 1 foot to 15 inches from plant to plant produces excellent material. To command early and long-lasting supplies of Christmas Roses they should be planted in quantities in single file, double or treble rows, at the foot of as many walls as can be spared. Some of the finest I ever saw were on gravel at the foot of a long terrace wall clothed with Tea Roses. Others were near on grass at the foot of another wall, and these were three weeks or more late, as a rule. Those at the foot of west walls continued the succession from the middle of December, and yet others on east and north walls yielded late harvests of Christmas Roses as long as wanted. South and other borders were altogether appropriated for blocks or masses of Christmas Roses. Other blocks were planted in sheltered and semi-shaded places.

It is a useful plan to plant Christmas Roses in blocks the size of two or three light frames. These, if placed over the Christmas Roses early in the winter, will hasten the blooming by a fortnight or three weeks, and preserve every flower pure and untarnished white as snow. Narrow glass lights run lengthways to enclose a row of these plants at the base of walls, also to hasten their blooming, and protect the bloom from hail, frost, and wind. Of course, too, the plants may be lifted, planted in a mild bottom-heat in pits or frames, or potted-up and placed in a temperature of from 45° to 55°. But these plants flower best under cool treatment, and most of the finest I have seen or grown have been those with wood, glass, or other covering in the open air.

In mild winters, and in sheltered gardens, the plants flower superbly in the open air, but the blooms often get spotted and tarnished by sudden storms and change of temperature; and hence, few things pay better than the use of portable glass frames, Rendle's glass and tile-protectors, *cloches*, and handlights, in the forwarding of Christmas Roses. The flowers being so much and so long ahead of the leaves renders some slight protection the more useful.

The peculiar form of the buds also act as a most potent sort of protection through their earlier stages. Neither frost, snow, hail, or rain, can very easily get to or remain in the central part of the bloom. Nor must it be assumed that either of these need injure the flowers much, or the plants at all, if they did. They might, however, mar the spotless purity of the blossoms as well as lower their price and lessen their artistic effect.

There is another very simple way of hastening and preserving the flowers of Christmas Roses. This is to cut them in bud, place them in a temperature of 50°, change the water daily, and cut a thin section off the end of the stalk every second or third day. Some add a pinch of guano, soot, smelling-salts, bone-meal, or other manure, liquid or solid, to add to the food-supplies, or preserve the water sweet. But these are not really needful for the evolution of perfect and spotless flowers from perfectly-formed three-quarter-developed buds.

For early work, and room or church decoration,

the common Christmas Rose, *Helleborus niger*, is still one of the most useful; *H. angustifolius*, with leaves and flowers smaller and earlier than the type; and the two or three varieties as *H. m. altifolius*, *H. m. major* and *H. m. maximus*, having flowers from 3 to 4 inches in diameter. There is also what may properly be called a fine-foliaged Christmas Rose of the same species, though it continues rather rare—a veritable *Helleborus niger*, with its foliage fringed with white.

In this connection it is not needful to refer to the other innumerable varieties, that are so admirably adapted for beds, borders, wild gardens, ferneries, rockeries, shrubberies; nor to describe or dwell on the importance of the *Helleborus niger* for the out-of-door decoration of gardens and pleasure-grounds. Single plants in all sorts of nooks and corners are always welcome, while few or none have ever been known to complain that their groups of Christmas Roses were too large, or their masses too heavy.

After planting, whether for early flowering in the house or under glass, or artistic effect in the open, masterly inactivity suits the plant best. An occasional soaking in abnormally dry weather, and an annual top-dressing every March or April after blooming, is about all the culture needed to not only maintain the vitality, but increase the flowers of these fine old plants. One of the most congenial top dressings consists of half of sweet leaf-mould and half rotted hot-bed or farm-yard manure. Of course the surface will be kept free from weeds, the dead flowers cut off to prevent the waste of strength in the formation of useless seeds (for practically they are useless unless for raising new varieties, as it takes six or more years to flower seedlings). The leaves should also be religiously preserved until quite matured. The more the crowns and roots get crowded, and the longer, in reason, they are left to establish themselves on the same spot, the more prodigal do Christmas Roses become. D. T. Fish.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

General Remarks.—A heavy snowfall, accompanied by frost of exceptional severity, caused a suspension of work in the hardy fruit-garden in mid December, but, happily, the snow did not lie long, and at the time of writing the various operations incidental to this department are again in full swing. Those who have kept pace with the calendar will have accomplished the bulk of the work, but for everyone so fortunate there are others who are in arrears, or have not yet made even a commencement. Any gardeners so placed must now push on with the work as energetically as possible. The principal work to be done at this season consists in pruning, training, nailing, or tying, as the case may be, together with the thorough cleansing of the trees, whether from a remedial or preventive point of view. These matters must, therefore, first engage our attention here, and they will be dealt with in rotation. The remarks that I shall have to make week by week will be based on lines upon which hardy fruit-growing is practised in these gardens.

Pruning.—Trees upon walls will first demand attention. The rule is to commence with Morello Cherries, but at this season it would be better, owing to their precociousness, to start with Apriots. Some growers train the Apriots in much the same way as they do the Peach; others lay-in young wood, and allow the branches to become well furnished with fruiting-spurs as well—both are good systems. It is seldom necessary to thin out young wood in Apriots-trees to a large extent, but when needful it should be done. Spur-growths must be shortened to three buds, and all dead snags cut away. Trees clothed with a quantity of old spurs that project some distance from the wall should be given a judicious "spur-pruning," that is, the oldest and longest of the spurs may be cut back to within half-an-inch of the branches from which they have grown. The small piece of wood so left usually contains a few dormant buds which break during the ensuing season; or dormant buds

situated on the branch itself will break, and the consequent growths form fruiting-spurs the first year. The chief point to be observed in spur-pruning is to spread the operation over at least two or three seasons, and thus avoid giving a severe check to the trees, and also the loss of a crop of fruit. Young trees need to have the wood thinned and regulated. Any trees that are growing too strongly should be lifted instead of using the knife severely, as this practice may result in "gumming." If the roots are laid out afresh in compost containing a good percentage of calcareous matter, and brickbats broken small, it will check the evil. Trees trained as cordons and clothed with spurs and kept summer pinched, or from which young wood is trained out at right angles to the stem, will need spurping back to three buds in the first case, and the wood thinned out if necessary in the latter.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

General Remarks. At this season of the year many plants under glass should be partially resting, and need only sufficient water to keep the roots in a healthy condition, and prevent flagging of the foliage. Such free-growing subjects as *Allamandas*, *Stephanotis*, *Clerodendrons*, &c., should now be thinned out, and the growths shortened where necessary; this will not only benefit the plants and induce in them free flowering later on, but, where grown as creepers, will allow more light to reach the plants upon stages underneath. It is not advisable to commence re-potting plants generally until the days begin to lengthen, and roots are becoming active. Advantage should be taken of the present to have all plants thoroughly cleaned, and sufficient potting materials prepared, and put under cover. During exceptionally cold weather, temperatures should be lowered—60° or 55° at night will be quite safe for most stove plants. It is much better for plant life, to maintain a steady, moderate temperature, varying to some extent with the condition of the weather, than to insist on a rule (which was formerly in force at many places) that a fixed heat must be kept up every night and day. If frost occurs for any length of time, it will be advisable to move *Nepenthes* to the forcing-house and syringe them frequently with tepid soft water.

Poinsettias, Euphorbias, and Chrysanthemums.—January is not a very gay month for flowering plants; the blaze of *Chrysanthemums* is over, and *Poinsettias* are mostly past their best. The latter should not be packed away under stages, &c., but gradually dried off, encouraging them to retain the foliage as long as possible. Subsequently they may be laid on their sides under stages in a warm house until required for propagation. Select the strongest for stock, and throw away all late-struck plants. *Euphorbia Jacquinæiflora* requires more care after it has flowered, and should not be dried off like *Poinsettias*, but watered occasionally while at rest. *Chrysanthemum*-cuttings, if not already put in, should be made and inserted without delay, and the stool pots emptied and stored away. The old soil from *Chrysanthemum*-stools makes an excellent top-dressing for *Violets* on borders.

Bulbs in pots that were plunged in ashes or other material should now be examined, and if well rooted they may be removed to cold pits, and introduced subsequently to heat in batches as required. *Hyacinths* in glasses should also be brought to the light gradually: carefully lift each bulb, and remove all decayed scales. The glasses require filling to base of bulb from time to time—soft water is best. Pieces of charcoal in the water are often recommended, but I have grown *Hyacinths* in water both with and without, under the same conditions, without any difference being apparent in the quality of the flowers. Ladies often prefer *Hyacinths* grown in water, and for indoor cultivation glasses are interesting; but better results can always be obtained when grown in good mould, and those in pots can be used far more effectively for the furnishing of conservatories, and as plants in groups for indoor decoration.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Vines.—At the beginning of the forcing season it is advisable to take stock of every Vine or other fruit tree that it is intended to force; and to

ascertain the conditions under which the roots are placed, and as far as possible rectify any defects that would operate against a quick and healthy root action. It is useless expecting good results from Vines that are not well-established, and growing under healthy conditions at the root. After a good deal of experience in making new and taking out of old borders, I have come to a conclusion that stratified borders are the best, and retain their power of aeration for the longest period. As this is the best season for commencing new borders, a few words on their construction on the stratified principle may be useful to beginners who desire to excel in the production of Grapes. Briefly it is as follows: depth of border, 3 feet 6 inches; place a 6-inch drain in front and the whole length of the border, and 6 inches lower than the bottom of the border. Into this run cross-drains from back to front of border at intervals of 10 or 12 feet apart, according to the dryness or retentiveness of the surrounding soil. Over these drains should be placed 1 foot of open drainage material consisting of rough brickbats and old mortar, covering this with good fibry turves of medium texture loam, grass side downwards. The work is completed by putting a layer of 3 or 4 inches of fine mortar-rubble, burnt ashes, limestone chippings, or road grit, between each layer of loam until the border is completed. Bones, soot, nitrate of potash, sulphate of ammonia, or any other approved manure can be very conveniently added with the layers of rubble as the work proceeds. A border constructed on this principle accelerates root action to a remarkable degree, and also accelerates the manufacture of food for the roots. It really constitutes "Living earth," a subject often referred to in past numbers of the *Gardeners' Chronicle*. When a beginner realises that it is possible to multiply root action as freely as to extend leaf growth, he will be on the way to success. Aeration and root ramification are too large subjects to go fully into here, but they will be referred to again when their influence on growth is more evident. Routine work will not be heavy just now. Pot Vines must be very carefully watered until several inches of healthy growth has been made. Disbud early any now breaking, so as to force all the strength of the plant into the selected growths; and any growths inclined to take the lead should be stopped a leaf or two beyond the bunch. Succession houses should be kept duly syringed and damped down, and at temperatures from 50° to 65° according to the stage of development in the Vines and the state of the weather. Prune, styptic, and thoroughly cleanse Vines in late houses as the fruit is cleared from them.

Late Houses containing Fruit.—Houses where the fruit is still hanging, should be kept at an equable temperature of about 48°. Keep the house closed on damp, foggy days, but take advantage of every fine day to open the ventilators to clear the house of moisture. Look over the bunches frequently, and remove all decayed berries. The Grape-room should be thoroughly cleansed and purified ready for the reception of any fruits it may be desirable to bottle. It will be of great advantage to the Vines—especially Gros Colmar—to clear them of their fruit as soon as possible after this date.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAP, Bart., Clare Lawn, East Sheen.

On forming a Collection.—Instances of good Orchid collections resulting from small beginnings are numerous, and in more than one case their origin was attributable to accident rather than design. In such instances the plants first obtained would probably be grown in structures containing other species of plants, and their welfare would depend a great deal on accidental environment and treatment. Where the plants succeeded the desire to acquire more would naturally follow, but where their cultivation was attended with failure the ardour of the owner would be damped, and eventually killed; the cultivator would probably be blamed, and the plants relegated to the rubbish-heap. The formation of an Orchid collection without first carrying out a few necessary alterations and additions to the existing houses is sure to be attended with large expense and mental worry. I would particularly impress upon gentlemen contemplating the cultivation of Orchids the necessity there is to make a good start.

The houses.—Before purchasing plants seek some reliable expert, and obtain his opinion on the suitability or otherwise of the existing glass structures, and have done what is considered necessary before the plants are obtained. I know very well that scientifically-built houses are not the only requisite to success, but when one has these, failure to grow the plants must be due to faulty attention or unsuitability of locality. The latter is a greater factor in the cultivation of Orchids than is generally admitted, and it is only by experiment that the deleterious qualities or otherwise of a district can be determined. When building new houses, do not put them at the north side of a high wall, no matter what class of plants it is intended to cultivate. Shelter from cold north and east winds is desirable, but by all means build on the south side of the wall if it exists, so that light of equal degree can reach the plants on both sides. The houses should run north and south, those running east and west are seldom so successful. Shade can always be afforded when required, but light, the greatest factor in Orchid cultivation, is not at our command.

The plants.—To the beginner, newly imported plants offer a much greater degree of possible success, and excite more interest than do established plants whose qualities are known, and have at the same time, to a certain extent, lost their native vigour. Hybrids naturally have to be either raised, or purchased from raisers. If speculation is not one's object, disappointment and complaint may be avoided by purchasing hybrids when in flower, or a guarantee should be acquired with the plants certifying to their genuineness. Newly-acquired plants should be thoroughly examined for possible insect pests, and means taken to rid the plants of them when present. Failing this, injury and mortification may follow, as I can sorrowfully affirm, for some years ago a plant came into this collection on which were a few "stock-seed" scale, and in a very short time these had increased and infested other plants, and even to this day we have been unable to eradicate the pest from the one house.

Keeping a Record.—The value and interest in individual plants may be greatly increased by keeping reliable records in a special book of their date of introduction to the collection, their origin, and the price paid for them. It will also afford evidence of the longevity of the various plants, and when notes are added concerning their size and condition when received, valuable knowledge will result.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Preparing Soil.—It is essential that land to be used for the cultivation of vegetables should be thoroughly drained either naturally or by artificial means, so that the surface water may pass quickly through the soil. As each quarter becomes vacant, deeply dig or trench the ground, taking advantage of dry and frosty weather to wheel on the manure or fresh soil necessary for the future crops. Soils of a heavy or clayey nature may be made more productive by trenching from two to three feet deep, and placing at the bottom a good layer of farmyard manure. If the latter be not available in quantity throw up the soil in a slanting manner, and on each layer throw some road scrapings, mould, grit or charred soil, and leave the clods rough upon the surface to be pulverised by the air and frost. Some leaf mould or other light material may be worked in later on. Soils of a lighter nature may be made more retentive by adding some fresh loam to the staple. If the sub-soil is gravelly, double dig the ground, but on no account do this when snow or frost is on the surface, as if buried in this state it would lay cold for months.

Borders with a southern aspect are the best possible for the growth of early Peas, and when digging and preparing these it is advisable to add leaf mould in preference to manure. Peas root more freely into this, and are not so apt to rot at the roots. Such positions it is intended to plant with early Potatoes may be dug, and the soil thrown up into ridges for the better exposure to air.

Pits not supplied with hot-water pipes will need to be furnished with some system of bottom heat to be used in forcing such vegetables as Carrots, Radishes, Potatoes, &c. Some stable litter and leaves (Oak if procurable), if well mixed together, will answer for this purpose. Use one part of the

former to three parts of the latter, and damp the whole, and turn it over two or three times. It will then ferment, and subsequently become ready for use.

Seakale.—Though some prefer to prepare crowns and lift and force them in a Mushroom-house or other warm structure, I have not found the system better than that of forcing the roots in the open ground. For the latter method the stools should be grown at a reasonable distance apart. Before placing the pots over the crowns, lightly fork up the surface of soil around them, and sprinkle over it some ashes and soot. Some well-fermented manure and leaves should next be laid firmly between and to cover the pots. The quality of the manure as well as the state of the weather must be taken into consideration in determining what depth of this is to be used. In no case must the temperature be allowed to rise over 60°. It is essential that air should be totally excluded from the plants, and if any of the pot-lids be faulty, some squares of turf may be used instead.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ilchester, Abbotsbury Castle, Dorset.

Flower Beds and Borders.—Much important work in the flower-garden may be done at this season. Any unoccupied beds and borders, the soil in which is considerably exhausted, may be much improved by the addition of a nutritive compost. Take away about one-third of the old soil and spread it over the nearest shrubberies, or over bare and unsightly roots of bushes and large trees. Or if screened and a little soot added it would form a useful top-dressing for the lawns. In place of the soil removed from the beds, afford a compost of matured turf with sufficient leaf-mould and sand (road grit preferable) added to make the whole freely porous. The turf used should have been in stack two years, associated with layers of manure and sprinklings of soot. This would work easily and be rich enough for most bedding and border plants. Wheel the new soil to the beds in frosty weather, or over planks, and thoroughly incorporate it with that already in the beds.

Bulb Garden.—Plant in these beds some dwarf-growing spring bedding plants, as *Myosotis*, Dwarf Wallflowers, Saxifrages, Sedums, &c. By this means a succession of bloom will be obtained, and the surface of the beds being furnished, a certain amount of cold will be excluded. If such plants be not used, apply a layer of Cocoa-fibre or fine leaf-soil over the surface, and if a sprinkling of soot or native guano be added it will keep down insects and scare the birds for a time, as they do not like either. Beds for Cannas, tuberous Begonias, and choice Dahlias should be made richer than for most other plants. Begonias like leaf-mould or peat added.

Bedding Plants in greenhouses and frames will require care to prevent "damping." Remove all dead foliage, and keep a sharp look-out for green-fly. Do not over-water the plants, nor encourage excessive heat. On favourable days give sufficient ventilation to keep the stock plants healthy and hard.

Herbaceous Borders which have been mulched with manure, leaf-soil, or charred remains from the smother or rubbish heap, may be lightly dug over in open weather. This rubbish should not be allowed to flame, but treated after the method of charcoal burning. The ashes are then more valuable, and may be used to advantage on stiff soils, or as little heaps round the more tender and brittle plants in the border to protect them from frost; also for marking those which are not to be disturbed in the process of digging. Such gross feeders as *Helianthus*, Perennial Chrysanthemum, *Iuclae*, Asters, *Phlox*, &c., should, during the digging, be restricted if not thoroughly divided. The spare pieces may be planted in copse or wood adjoining the grounds. Clearings or openings of this kind are sometimes seen from the residence, and if the landscape be hilly, pleasant patches of colour may be so obtained.

Roads and Drainage.—The routine of level taking, rolling all roads and paths during mild weather should be followed, and re-gravelling of any that require such attention; clearing away leaves and grit from drains and gutters. Good drainage is essential to all practical work in the garden.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	JAN. 9	Royal Horticultural Society's Committees, Meeting.
THURSDAY,	JAN. 11	Manchester Orchid Society, Meeting.
FRIDAY,	JAN. 12	Gardeners' Royal Benevolent Institution, Annual Meeting, and Election of Pensioners.

SALES.

MONDAY, JAN. 8.—Dutch Bulbs, Greenhouse Plants, Roses, &c., at Protheroe & Morris' Rooms, at 12.30 o'clock.
 WEDNESDAY, JAN. 10.—Japanese Lilies, Azaleas, Spiræas, Roses, &c., at Protheroe & Morris' Rooms, at 12.30 o'clock.
 FRIDAY, JAN. 12.—Imported and Established Orchids, at Protheroe & Morris' Rooms, at 12.30 o'clock.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36'4".

ACTUAL TEMPERATURES:—

LONDON.—January 3 (6 P.M.): Max. 49°; Min. 44°.

Rain; dull; colder; wind N.

PROVINCES.—January 3 (6 P.M.): Max. 47°, S.W. Ireland; Min. 38°, N.E. Scotland.

How strange the figures look! how impossible it is to divine what the new year may have in store for us! We can only refer to some of the "fixtures" recorded in the Almanac given with the present number. From that record it would appear as if there would be little to ruffle the ordinary course of events, but the awful war-spectre is for the moment too much in view to enable us to look forward with much confidence as to the occurrence of anything out of the ordinary routine.

The Royal Horticultural Society's Committees will doubtless pursue their even tenor, and if they can manage to diminish the number of awards, of so much higher value will the others be. The society is said to be meditating some important step on the occasion of the centenary of its foundation in 1904, and will perhaps reserve any great effort till that time. There is, too, the feeling which is gradually spreading that the experimental garden at Chiswick must sooner rather than later be given up, as owing to its smoky, foggy atmosphere and urban surroundings, it is no longer suitable as the experimental garden of the Society. Of course, if this is really so, all the sentiment attaching to the old garden must be decently buried. The process will not be so distressing as once it would have been; for those who remember Chiswick when it was three or four times larger than it is now, and when it was really a horticultural centre to a much larger extent than it is at present, are fast disappearing. The new generation is mostly ignorant of what Chiswick has done in the past, and even if it hears "what our fathers have told us," it is not in its nature to display much reverence for an institution which has become more or less out of harmony with its surroundings.

The new Charter of the Society has not, up to the present, been granted, but when it is it will, we believe, be found to be much simpler than the old one, and the government of the Society will be largely by means of bye-laws. It will no doubt be difficult to frame

these aright, and much discussion and time must be expended in elaborating them. Nevertheless, there will now remain the satisfactory feeling that if any particular bye-law needs amendment, the improvement can be carried out easily in a constitutional manner, and we shall no longer be told that this or that cannot be done because of the Charter.

The Central Hall seems as far off as ever; and the Drill Hall, with all its obvious defects, is still what it was when it was first recommended by the committee appointed for the purpose, the most convenient site available.

Horticulture will be represented as usual at the Paris Exhibition, but in our experience horticulture on such occasions has been swamped and thrown into the shade by the multitude and magnitude of the exhibits in other departments. As far as Great Britain is concerned, it is probable that we shall be too much engaged in more serious matters to be able to devote much attention to the Paris Exhibition. We shall be thankful indeed if it prove otherwise. Fortunately, the best relations exist between the representative horticulturists of all countries. The death of HENRY DE VILMORIN is an illustration. No Frenchman could have mourned his loss more than we did. It is only necessary to refer to the Press of the two countries to see that in this case nationality was effaced, and human sympathy prevailed even over difference of race.

The Sweet-Pea Conference will no doubt be of some use in formulating the directions in which improvements should be sought, and in enabling some sort of a classification to be arrived at. Otherwise, the history of the plant is well known; its progress has been even; there has been no hybridisation to introduce important changes of structure; a sport, in the true sense of the word, has never been observed. On the whole, it would seem that the machinery of a Conference is hardly needed in the case of the Sweet-Pea; but, in any case, such a meeting can do no harm to any, and will give pleasure to many.

THE DUKE OF WESTMINSTER.—The death of this nobleman leaves the world of horticulture the poorer for the loss of a discriminating patron, and deprives the Gardeners' Royal Benevolent Institution of its president. The gardens at Eaton Hall, near Chester, have often been described in our columns.

SIR JAMES BLYTH, Blythwood, Stansted, Essex, has published a pamphlet under the title of the *Agricultural Awakening*, in which he alludes to the gratifying evidences we see in the shape of agricultural colleges, technical schools, travelling instructors, and the like, which we advocated so frequently in years gone by; at length we have the satisfaction of seeing some progress being made. We are still behind the Germans and our American cousins in all educational matters, and it is to be hoped that our present trials will lead to a national awakening.

SIR JAMES PAGET died on Saturday last in his eighty-sixth year. As a surgeon, at once scientific and practical, he attained the highest rank. He had a keen and receptive intellect, always ready to assimilate new ideas, while he sedulously maintained those which commended themselves to his judgment. Besides his great intellectual powers he had a rectitude of character and a charm of manner that endeared him to his associates, and caused his pupils to revere him. Readers of the *Gardeners' Chronicle* will wonder why a great surgeon not specially connected with horticulture should be thus spoken of in its columns. The reason is that PAGET was a naturalist, and derived his facts and framed his inferences from the diseases

of plants as well as of animals; and our columns have been in former years enriched by various communications of his on "Vegetable Pathology."

PROF. CARL HANSEN.—In celebration of the professional jubilee of this gentleman (known here as the author of the *Pinetum Danicum* in the Conifer Conference Report), it is proposed to place his bust in the Academy. Communications should be sent to M. CARL OLSEN, Jardinier en Chef au Jardin Zoologique de Copenhague.

SIR JOHN LUBBOCK.—There is no need to sound the praises of this many-sided man in the *Gardeners' Chronicle*. It is as naturalists that we welcome a past President of the Linnean Society as a peer of the realm. Possibly his retirement from the House of Commons will give him more leisure for those nature studies which are deservedly so popular. We trust that his connection with the University of London, of which he is the representative in Parliament, will not be severed.

EVERARD IM THURN, C.B.—Readers of this journal will feel no surprise at the honour conferred on this gentleman. It is, however, not as a traveller and a botanist that this honour is conferred, but for his diplomatic services in British Guiana, and his laborious work in connection with the Venezuela Arbitration.

ALPHAND.—A monument has just been erected in the Avenue du Bois de Boulogne to the memory of the great engineer and landscape-gardener, who did so much to transform Paris and make her the beautiful city she still remains.

LADY EMILY FOLEY.—The death, in her 95th year, of this lady, on January 1, is announced. The garden establishment at Stoke Edith Park, Hereford, is well known.

CHARLES DARWIN.—The thirteenth volume of the *Annals of Botany* opens with a portrait of DARWIN in middle life, and with a judicious sketch of his botanical work, which is divided into two distinct but mutually related sections, that which was necessary for the explanation of his species theory, that requisite to afford corroborative evidence, and that which, in the main, is physiological.

ROYAL HORTICULTURAL SOCIETY.—The first meeting of the committees of the Royal Horticultural Society in 1900 will be held, as usual, in the Drill Hall, Westminster, on Tuesday next, January 9. The Scientific Committee will meet at 4 P.M.

"KEW BULLETIN."—Appendix III. of this publication is devoted to the enumeration of the members of the staff at Kew, and the various governmental or academic institutions at home, in India, or the Colonies.

THE WEST INDIES.—The *Times* has recently contained some very long but very interesting articles on the economic condition of these islands. Jamaica, like the other islands, feels the pinch of the great reduction in the sugar and rum industries, but, on the contrary, she is recouping herself well in fruit culture—principally Bananas. An enormous trade with the United States has sprung up, and means are being taken to increase the trade with the mother-country also. Oranges, too, are very largely grown, the consignments to the States having risen in consequence of the "freezes" which affected the Florida Oranges. FROUDE says, the worst Orange I ate in Jamaica was better than the best I ever ate in Europe. Limes require more care in cultivation and in selection of suitable localities than do Oranges. The so-called Grapefruit, *C. decumana*, is what we know here as the Shaddock, or the Pomelo. A small form of it is the "Forbidden Fruit." It is pleasant to read of the work of the Botanic Gardens and of the part that the botanists have played in the development of cultural industries, and we may be sure that under the zealous control of Dr. MORRIS, much more will be done in future than has even now been effected. It is pleasant also to read just now

the following tribute to British rule paid by an American citizen:—"The universal aspect of order and respect for law that everywhere prevail in Jamaica are no less conspicuous than the natural beauties of the island, and are noted by any one who has travelled in the more unruly places of the tropics. The dread of unconscious violation of some trivial law which haunts one in Cuba, the feeling of being watched as in Puerto Rico, the suspicion of some other person's hand in your pocket as in Mexico, the fear of brushing against contagion at every step as in Martinique, San Domingo, and Hayti, are sensations which do not worry the traveller here. The stranger is welcomed with a sincere hospitality and courteous greeting; the island is clean, and the laws are for the protection of the visitor as well as of the resident—not for the robbery of the individual or the enrichment of the official. Thieves are confined in prison; those infected with loathsome diseases are isolated; rigid quarantine keeps contagion out, and health officials attend to public sanitation. Neatly uniformed constabulary of respectful mien and open eyes see that the laws are obeyed, and the poorest negro as well as the richest planter feels that they are for his special benefit and protection, and respects them in a spirit which is not found even in our own country. In fact, in the Government of Jamaica we have an example of that perfection of colonial administration in which England excels."

JAFFA ORANGE.—"It would be very interesting," writes Sir W. T. Thiselton Dyer, "to ascertain from what source the Jaffa Orange was introduced into Syria. The available information with respect to it was collected in an article in the *New Bulletin* for 1894 (pp. 117-119). The conclusion was, that it had been brought from Malta. In the *United States' Consular Report on Fruit Culture* (January, 1894, p. 599), it is stated that in Sicily 'oval fruit are preferred for commerce, being more durable.' But whether these are the same as Jaffa Oranges does not appear. Risso and Poiteau describe an *Oranger à fruit elliptique* as to be found in gardens at Nice. But the fruit is said to be small, and the description does not agree in other particulars with the Jaffa Orange. I have never myself seen an elliptical Orange anywhere on the Riviera. There is an interesting article on 'Orange-growing in Jaffa,' in *Chambers' Journal* for October 17, 1896. The writer states:—"In the vernacular the name for Orange is Portugan, doubtless a corruption of the word Portugal, and is an indication that the Orange was probably in the first instance introduced into Palestine from Portugal; but as it is not recorded when or by whom this tree was thus introduced, the origin of the name can only be a matter of surmise."

THE AMERICAN DEPARTMENT OF AGRICULTURE.—The Bureau of Agriculture was created in 1862 under a Chief Commissioner, with Mr. SAUNDERS as horticulturist, and a department chemist. In 1863 a statistician and an entomologist were appointed. Various departments were gradually established, so that at the present time there is the weather bureau, under Professor WILLIS MOORE, the bureau of animal industry, the division of statistics, the division of botany, under the management of Professor F. V. COVILLE; the division of forestry, under Mr. GIFFORD PINCHOT; the division of vegetable physiology and pathology, under Professor GALLOWAY; the division of seeds, the division of publications, the division of pomology, with Col. G. B. BRACKETT at the head; the division of agrostology, dealing with pasture grasses, and under the management of Professor LAMSON SCRIBNER; the division of soils, the office of public road inquiry, the division of entomology, under the direction of Mr. HOWARD; the division of biological survey, the section of foreign markets, the office of experiment stations, the division of chemistry, the library, the museum, and the division of finance. At first, our own inferiority in such matters bulks very large, but we have a very

restricted area as compared with the vast territories of the States. We are indebted to Mr. W. L. MOORE, Pilotpoint, Denton co., Texas, for the information above given.

"THE GARDENERS' MAGAZINE," CHRISTMAS NUMBER.—It is rather late in the day to speak of this, but none knows better than our contemporary the reason why. Moreover, the contents are such that they are seasonable at all times, so that when the rush and turmoil incident to the holiday season have passed there may be time to appreciate the good things the *Magazine* has provided. We shall not index the contents, we prefer to let the reader see for himself what there is in it, confident that he will have a good time—as the Americans say.

FERN STEALING.—The *Devon and Exeter Gazette* records the infliction of a fine of £10 and costs upon a notorious Fern-robber, who had been frequently convicted of a similar offence. Being unable or unwilling to pay the fine, the culprit was sentenced to two months' imprisonment with hard labour. It is to be hoped that this sentence will tend to check the deplorable vandalism which ruins the beauty of the country.

"ANNE PRATT'S FLOWERING-PLANTS."—The re-issue of this useful book, under the editorship of Mr. EDWARD STEPHENSON, proceeds steadily. It is of value to beginners, and to those who do not care to go very deeply into the minutiae of botany. To speak of "orders" and "tribes" as synonymous is to cause needless confusion. The illustrations are faithful. It is published weekly by F. WARNE & Co., 15, Bedford Street, Strand, W.C.

"NATAL PLANTS."—It is pleasing, in the midst of the war, to receive a copy of Mr. MEDLEY WOOD'S *Natal Plants*, or rather the first part of the second volume, which is devoted to grasses. The great value of pasture-grasses in such a climate will be readily recognised. The botanist in studying them may, in the long run, be rendering a greater service to humanity than is the warrior. Unfortunately, it seems as if it would be some time before we can dispense with the services of the latter.

"THE GARDEN ANNUAL."—This useful Almanack and Address-book for 1900, published at 37, Southampton Street, London, W.C., is to hand, and as usual contains a vast amount of information to all engaged in horticultural pursuits. Greater care is nevertheless necessary to keep the list of addresses up-to-date. In respect to the list of botanical and horticultural societies, for instance, we have found that the names of secretaries given are very misleading. Everyone should know by this time that Mr. BARRON has ceased to be the Secretary to the Royal Gardeners' Orphan Fund.

"REVUE DE L'HORTICULTURE BELGE."—The last two numbers have been taken up with an exhaustive and well-constructed Index, which will be of the greatest service to those who have to search the records of horticulture in the last quarter of the nineteenth century. The January number opens with a suggestive address to the readers, in which the association of labour and capital for a common purpose is foreshadowed. M. LEON VAN DEN BOSSCHE gives us a botanical study of *Eutaxia*, which shows how much interest is lost by those who are not botanists but cultivators only.

WELLS' CHRYSANTHEMUM CALENDAR, 1900.—This is a large sheet almanac, containing cultural notes for each month in the year, issued by Messrs. W. WELLS & Co., of Earlswood, Surrey. In the centre of the sheet is a fine coloured representation of the bright decorative Chrysanthemum *Etoile de Feu*, the qualities of which were described in the *Gardeners' Chronicle*, November 4, 1899, p. 348. There are also ten additional varieties, most of them novelties, illustrated on this sheet.

"MY GARDEN DIARY FOR 1900."—This is a delightfully artistic garden diary, published by Messrs. SUTTON & SONS, Reading. It is, however, as useful as it is ornamental, and the page of "Reminders" given with the calendar for each month are well calculated to bring the work of the moment to the mind of the gardener. A little space reserved for the entering of memoranda will be much appreciated.

VARIATIONS.—Mr. A. C. BARTLETT, of Pen-carrow Gardens, Cornwall, obligingly sends us a specimen of *Retinospora plumosa*, produced from a tree of *C. pisifera* of eighteen years' growth. It is very hard—perhaps we had better say we are quite unable—to assign the reason for this sudden change. Mr. BARTLETT also tells us of an Irish Yew planted about 1830, which has lately thrown up from its base a robust shoot of the common Yew.

THE SCHLEGEL ORCHID COLLECTION BURNT.—We see, from *American Gardening*, that the greenhouse range of Mr. GEO. SCHLEGEL, at First Avenue Bay Ridge, N.Y. (gr., Mr. Geo. Garrett), was destroyed by fire recently. The area of the four houses destroyed was about 3,600 feet, and the plants in another house, 75 by 24 feet, are lost through heat and smoke, though the structure itself still stands. The Schlegel collection of Orchids was one of the most famous in the neighbourhood of New York City, and together with the miscellaneous and general stock, may be valued at 20,000 dollars. Among the lost specimens were several *Phalenopsis*, estimated worth 600 dollars; *Lælia Arnoldiana*, *Cattleya Arnoldiana*, *Lælia Schroderiana alba*, *Vandas suavis*, tricolor, and *Sanderiana*, and two fine pieces of *Cypripedium Morganæ*. A very fine collection of *Cypripediums*, embracing all the best forms; a large lot of *Cattleyas*, and a representative lot of *Anthuriums* were also lost. We understand that the houses will be rebuilt at once.

HINTS TO PROSPECTIVE EMIGRANTS.—The following particulars are extracted from a circular just received from the Emigrants' Information Office, 31, Broadway, Westminster, S.W.:—"It is too early in the season for the ordinary emigrant to go to Canada, unless he has friends to go to or money to keep him till the spring, when there is likely to be the usual demand for competent farm labourers. In New South Wales there is practically no demand for ordinary farm or station hands, miners, or mechanics, unless they are specially competent and have a little money when they arrive. In Victoria there is not much improvement in the general demand for labour, except that a considerable number of those out of employment have been set to work on railway construction. There has been a remarkable increase in the number of females employed in factories, their numbers having doubled since 1888, whereas the number of male *employés* has declined. There has been a considerable amount of settlement on the land recently, and dairying has made special progress. In South Australia there has been a demand for farm hands, and for married couples without children for farm and station work. There is no demand for more mechanics in Adelaide or elsewhere, but miners have been well employed, and there is the usual demand for female servants. In Queensland there is a good demand for farm labourers, miners, and female servants, and for married couples in pastoral districts. Free and assisted passages are now being granted to farm labourers and female servants from seventeen to thirty-five years of age, who have never been otherwise engaged. In Western Australia the population, though it has rapidly increased, is still small, and therefore the demand for all kinds of labour is necessarily limited. Rents have fallen, and the cost of living has declined. The chief demand is for miners, farm labourers, and for female domestic servants; free passages are being offered to the latter. In Tasmania the supply of farm labourers is sufficient. In New Zealand competent bush-

fellers, road-makers, farm hands, and shearers have no difficulty in getting work in country districts during the present busy season. With regard to South Africa, persons are warned against going there at the present time in search of work.

THE ART AND CRAFT OF GARDEN MAKING.

—MR. THOMAS H. MAWSON, Garden Architect, is about to issue, through Messrs. George Newnes and Co., a book under this title, illustrated by a large number of perspective views by C. E. MALLOWS, and over 100 plans and details illustrative of garden design. The subject will be treated under these headings:—Garden Making Old and New, The Choice of a Site and its Treatment, Fences and Gates for Garden and Park, Entrance Gateways, Carriage Courts and Drives, Terrace and Flower Gardens, Lawns and Garden Walks, Summer Houses, Trellis Work and Garden Furniture Conservatories, Greenhouses, Vineries, and Fruit Houses, The Treatment of Water as Fountains, Lakes, Streams, and Ponds, Kitchen Gardens and Orchards, The Formal Arrangement of Trees and Shrubs as avenues, hedges, &c., Planting for Landscape Effect, Trees, Shrubs and Conifers, Hardy Climbers and Roses, Hardy Perennials, Aquatic Plants and Ferns, Examples of Gardens with Plans and Perspective Views.

PUBLICATIONS RECEIVED.—*The Century Book of Gardening* (George Newnes, Ltd., 7-12, Southampton Street, W.C.), Part 17.—*Unwin's Chap Book*, 1899-1900 (T. Fisher Unwin, London).—*Pharmaceutical Journal*, December 23, 1899.—*The Gardeners' Magazine*, Christmas Number, December 23, 1899.—*Le Mois Scientifique*, Octobre-Novembre, 1899 (Librairie J. B. Baillière et Fils, 19, Rue Hauteville, Paris).—*Le Monteur d'Horticulture*, December 25, 1899.—*Illustrirte Garten Zeitung*, December, 1899.—*Geschiede Allgemeine Gartner-Borse*, December 10.—*Tijdschrift voor Tuinbouw*, Vijfde Jaargang, Zeede Afslevering.—*Indian Gardening*, December 7.—*La Semaine Horticole* (79, Rue Wiertz, Brussels), December 23.

BLENHEIM.

[SEE SUPPLEMENTARY SHEET.]

THE famous seat of the Marlborough family adjoins the little town of Woodstock, some eight miles from Oxford. The park is very extensive, with undulating surface and noble Oaks. It was originally laid out by Wise, but its most remarkable feature is a lake constructed by "Capability" Brown, it is said, within a week. It is spanned by a fine bridge, and is one of the largest sheets of water in the kingdom. The mansion, of which the east front is shown in our illustration, was built by Vanbrugh. It contains a magnificent collection of pictures, and was recently visited by the German Emperor, who planted a tree (*Picea pungens glauca*), as a memorial of his visit. The sunk flower-garden is formal, in accordance with the style of the house, the flower-beds intermingled with Irish and golden Yews and clipped Portugal Laurels.

This Italian garden, situated on the east of the Palace, forms one of the most attractive features of those which contribute to the permanent beauty of this residence.

From the accompanying supplementary illustration a very good idea of it during the summer may be gathered. Considerations with regard to the method of planting the beds for producing an agreeable variation from year to year are taken, corresponding with the extent of the design. Much forethought is necessary to anticipate and provide for the alterations that may be decided on from year to year. Although the past season was not altogether a favourable one in the Midlands, this garden presented a very satisfactory appearance throughout the summer; the choice and arrangement of the colours being admirable.

The design of the garden is contained within a quadrangular figure, the length being about 260 feet, and the breadth 160 feet. This includes the exterior portions of the lower terrace-beds, and those of the sides, but not the verges and walks by which it is encompassed.

A broad central path divides the four sections containing the largest of the flower-beds, each of these being similar in form to that most conspicuous in the illustration.

They are individually ornamental grass-plots. The walk is interrupted by a central bed, surrounded with a margin of grass 4 feet in breadth, and corresponding with that of the general design. This forms the central feature, and, as compared with the surrounding beds, is rather larger, having a diameter of about 40 feet. Circular beds, 16 ft. in diameter, occupy positions in this walk, each forming central points at either end, and in addition large specimens in tubs, of both the green and variegated-leaved American Agave are utilised in the central path in a line with the beds, which are furnished with Palms and other ornamental-leaved plants. Palms are likewise introduced in the other circular beds, and together with those mentioned afford relief to the masses of flower colour, at the same time from all points of view are decidedly picturesque.

During last autumn a fountain, with basin, has been erected on the site of the central bed, which will doubtless in the future enhance the beauty of the *tout ensemble*.

Running the whole length of the garden, on either side, are long continuous borders, 7 feet wide, down the centres of both being circular beds, forty-two in number and 2 feet in diameter, surrounded with spar, dwarf Box being used as an edging throughout. The two flights of steps at the lower end are flanked with oval and hexagonal lozenge-formed beds, similarly disposed.

Some particulars may be given in connection with the number of plants Mr. Whillans the gardener has to provide to furnish the garden. There were used in the past season: 8,000 Pêlargoniums, 2,000 Begonia *semperflorens*, 12,000 Alternantheras, 10,000 Lobelias, 2,500 Ageratum, 2,000 Iresines, 1,400 tuberous Begonias, 1,000 *Centaurea ragusina candidissima*, and 800 yellow Calceolarias.

Contributing considerably to the general effect of the garden are the golden English Yews, clipped in various forms, which rise from a carpet-like base of yews in beds situated in the front of the conservatory range, which forms one of the boundaries of the garden.

ALPINE GARDEN.

CONVOLVULUS LINEATUS.

BUT for the shyness of its blooming in many gardens, and its rambling habit at the roots, the neat little *Convolvulus lineatus* would deserve a choice place in the alpine garden. These faults are, however, not readily overlooked, but he is fortunate who can induce it to flower freely. Even in gardens where it gives little or no bloom, it is neat and pretty with its lanceolate, silky leaves, whose silvery appearance makes it attractive to those who can appreciate such quiet charms. Those, however, who can persuade it to flower, or whose soil suits its needs, are more than pleased by the additional beauties of the reddish-purple flowers. It is a matter of regret that one cannot indicate with confidence the precise treatment which will be sure to make the plant flower regularly. It does not appear to like a heavy soil, but prefers a light and warm one. Even this will not persuade it to flower in some places. In the writer's garden it blooms but seldom, even with the adoption of what one considers the best remedy for non-flowering in the case of *Convolvulus lineatus*, i.e., the addition of a little lime-rubbish or limestone to the soil.

The running habit, although not so pronounced as in the case of some others of the genus, is yet sufficiently troublesome to cause one to take precautions against it by means of enclosing the space it is intended to occupy in such a way that it cannot encroach upon other plants. These faults notwithstanding—and one is prepared to admit that they are serious enough—we have reason to think that this "Pigmy *Convolvulus*" is worth growing. Its low stature of some 5 or 6 inches is a merit of consequence in the rock-garden. Although it comes from South Europe, it is fairly hardy.

ENOTHERA OVATA.

This pretty little Californian Evening Primrose has survived for two years in the open without any protection, so that one is inclined to think it hardy enough for all practical purposes in this garden. I take it to represent a type of plant of which we can hardly have too many in a choice collection of alpinists.

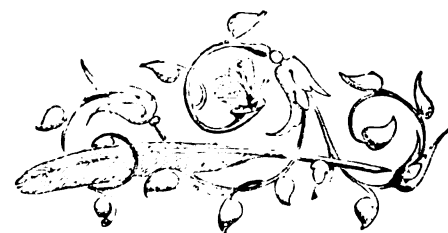

It is easy enough to obtain almost any number of plants which are exceedingly decorative on large rock-work, but it is difficult to have too many of dwarf habit which can find a fitting place either in the largest or the smallest rockery. In certain genera, such as the Saxifragas, we have many such flowers; but our natural, and within certain bounds, commendable desire for variety, leads us to seek plants of other habit, or with flowers of different shape or colour. Among the *Enotheras* we have a few others which are precious for this purpose. Some of these, such as *E. caespitosa* and *E. taraxacifolia*, are of more effective appearance than the one under notice, but it has, by way of compensation, qualities they do not possess.

It is not easy to convey in words the impression made upon the observer by this *Enothera*. A botanical description lies within the province of the botanist, and the writer can only attempt to speak of the general effect of the little plant and its flowers. It forms a neat little plant, with ovate, light green leaves, some 3 or 4 inches long, and resting close to the soil. From the centre arise the flowers on short stems, an inch or two in length at their highest. These flowers are pale yellow, and remind one of nothing so much as those of our common Primrose. They are of almost similar size.

Enothera ovata thrives well in this garden in very light, dry, and sandy soil, and in a position where it is shielded from strong sun, without being in full shade. It is a day bloomer, and is considerably superior to the Evening Primrose, known as *E. pumila*, which is more often met with. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

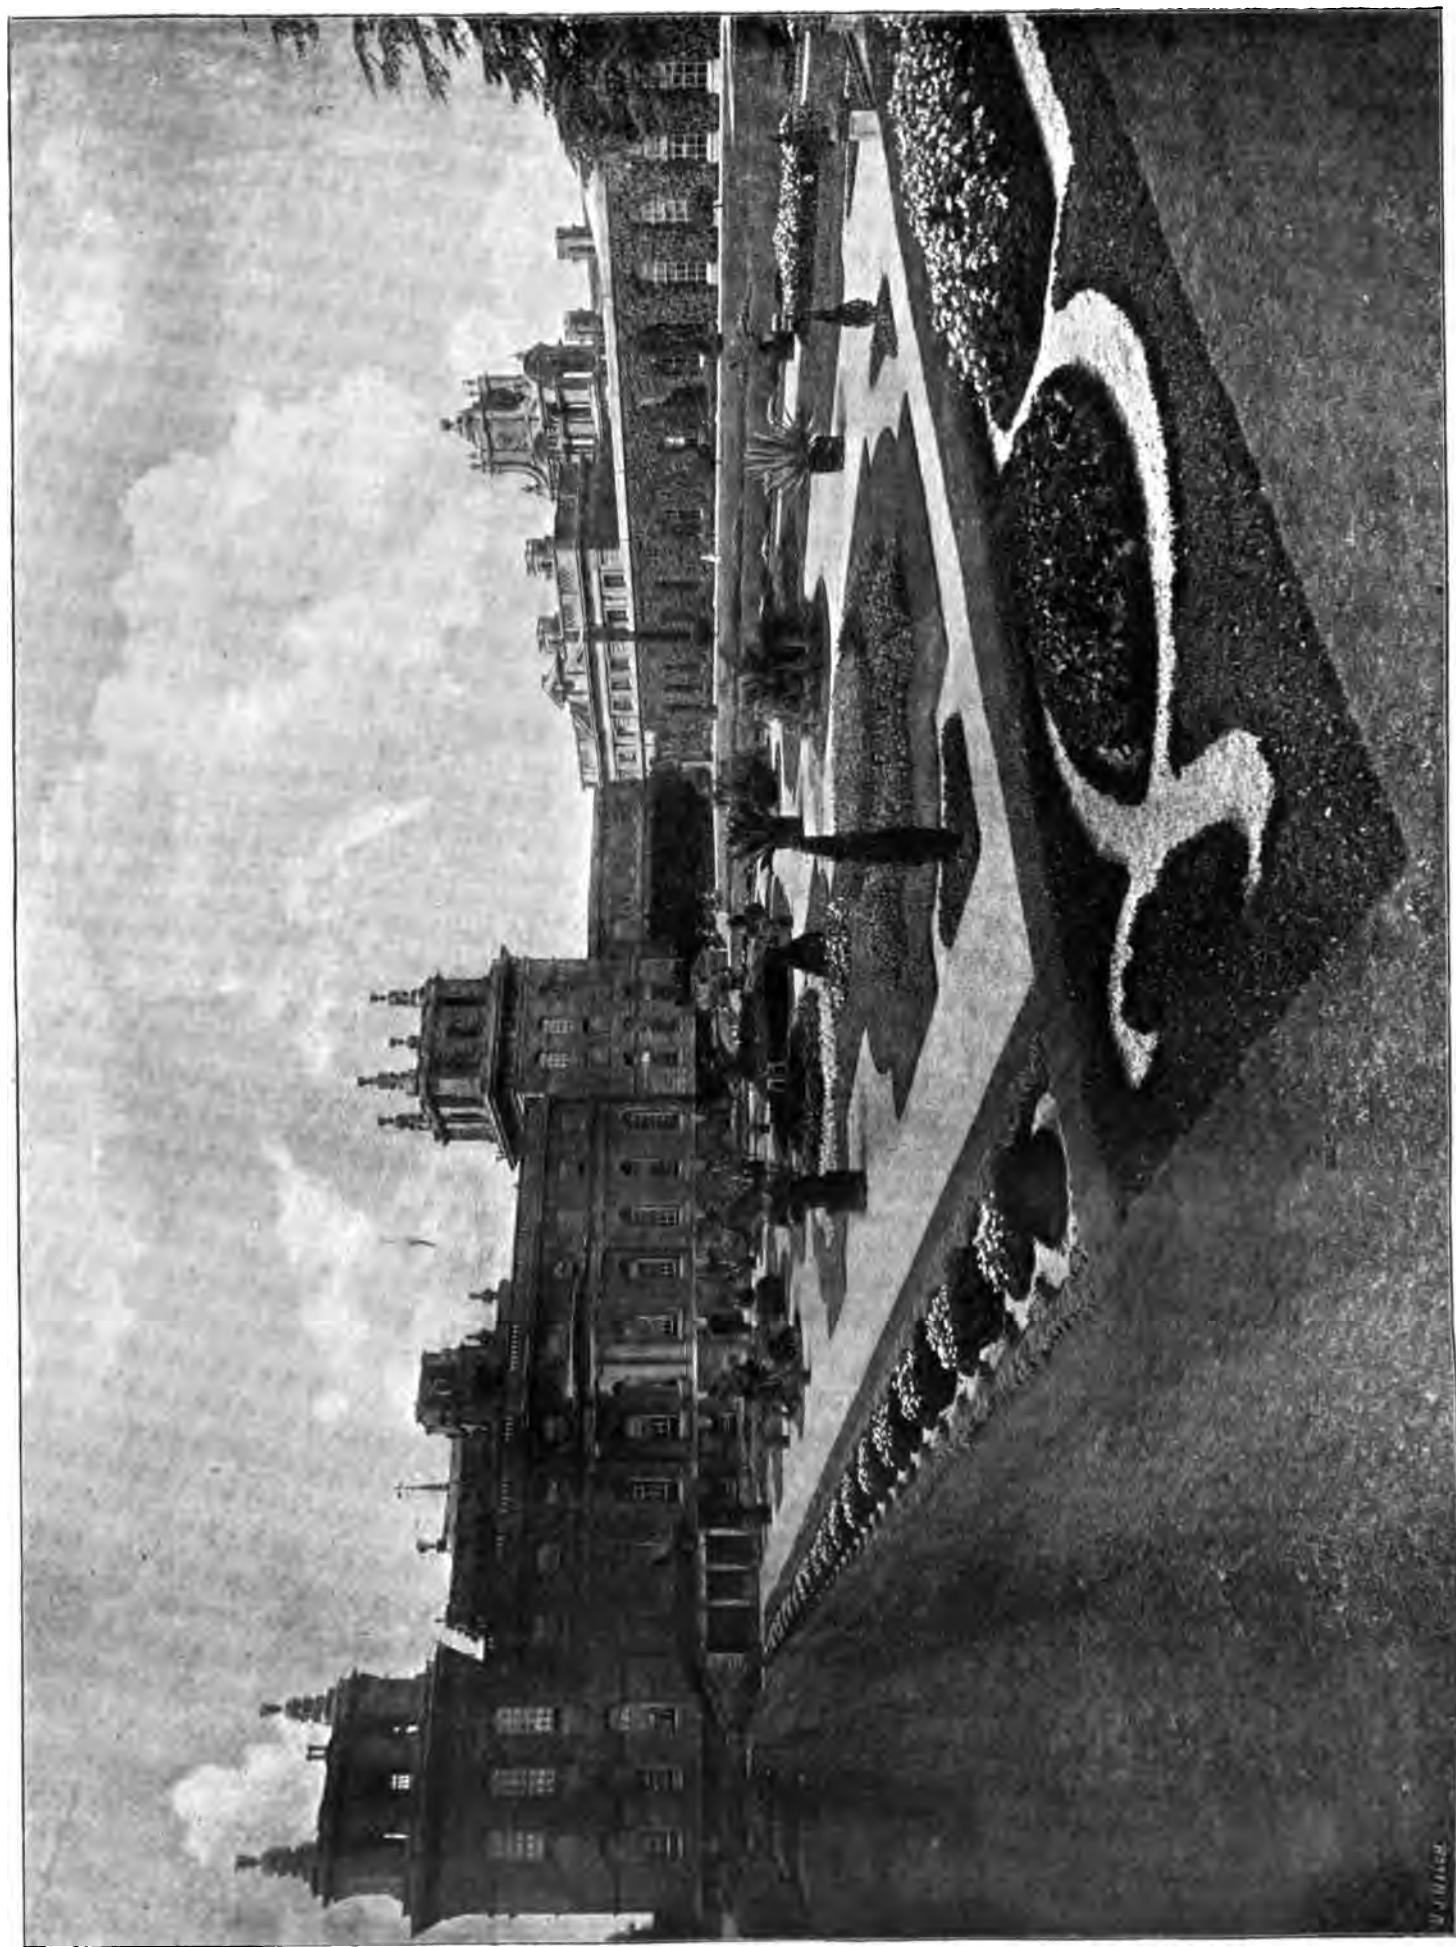

CARNATION SOUVENIR DE LA MALMAISON.

IN the *Gardeners' Chronicle* for August 26, 1899, a correspondent described the features of the gardens at Davenham Bank, Malvern, the residence of C. Dyson Perrin, Esq. (gr., Mr. Jas. Charlton). The Carnations then in bloom were stated to be very fine, and a group of "Malmaison" varieties arranged on the floor of the conservatory displayed as many as 570 expanded flowers. A specimen-plant of this type, from the Davenham Bank collection, we are now able to reproduce in fig. 3. Tree-Carnations are also grown with much success in these gardens.

HOME CORRESPONDENCE.

SOIL MOISTURE.—Unless we get a very heavy rainfall during January and February, then is it most probable that next summer gardeners will have again to face a very dry and difficult season. That each of the preceding dry summers gave trouble enough there can be no doubt. But a yet further one with the subsoil still so depleted of moisture as is now the case, may well make gardeners anxious, and no amount of anxiety can bring rain: that will come only when natural causes operate to produce it. Even the best laid schemes

THE ITALIAN GARDEN AT BLENHEIM PALACE, OXON.

for water storage and use in dry seasons fail often because the rain to supply the reservoirs fails to come, and then the gardener is as helpless as is the unfortunate one who has no supply but the scanty one which nature furnishes. Cisterns, tanks, reservoirs, mains, are all created in vain if after all nature refuses to fill them with water. In such case there is no better resource than is found in deep cultivation. But deep culture means hard work, and because it is such it is too often shirked in smaller, especially in amateur gardens. In our best private gardens, trenching, and deep trenching too, is, as a rule, as much a part of the ordinary

Very much depends on the crops, but there are few strong growers of the summer that do not root deeply when they are both permitted and encouraged to do so. Surface manuring is very well in moist seasons, because shallow roots then find food and moisture, but it is best to invariably regard a dry summer as possible and even probable, and therefore, if deep manuring, in addition to deep working, encourages roots to go deep, the gain in dry seasons is very great. How many of those persons who garden, persuaded of the value of deeply worked soil for Celery, Peas, and Runner Beans, prepare for them receptive deep-worked and

bish, but in many gardens the rubbish constitutes the chief manure, and when with it as thus treated is added three feet trenchings, the results in crop production are remarkable. There is yet ample time for deep trenching of garden ground. It is difficult to find at this time of the year more healthful or more profitable occupation. Young men in houses would rejoice to have a couple of hours daily of such exercise. A. D.

GEOLOGICAL FORMATION AND THE COMPOSITION OF A SOIL.—The following notes of a paper read by Mr. A. Bernard lately at the International Chemical Congress appear in a recent number of the *Agricultural Gazette* by Mr. R. Hedger Wallace. These notes may prove a suggestive sequel to the article upon the Constitution of Rose Soils in the *Gardeners' Chronicle*, December 16, 1899. Mr. Bernard arranged the relationships between the geological constitution and chemical composition of soils under six classes. "The number of analyses are given in each class on the results of which the deductions have been drawn. These deductions may not be correct, but they form at any rate the basis on which practical experience will lead one to form a comparative opinion for himself. The six classes in question are as follows:—1. The granitic soils are generally poor in phosphoric acid, and destitute of lime (90 analyses). 2. Clay soils are compact and tenacious, poor in phosphoric acid, but rich in potash (22 analyses). 3. Lias soils are remarkably rich in phosphoric acid and potash (75 analyses). 4. The calcareous soils are very fertile and less tenacious than the preceding (53 analyses). 5. Soils of the Oxford formation are strong, rich, clayey, calcareous soils (90 analyses). 6. Ferruginous clays and sand are very poor soils, extremely deficient in lime and phosphoric acid (230 analyses). Mr. Wallace thus concludes his brief notes. This paper has not had the attention given to it that it deserves, and perhaps the brief *résumé* now given will lead to the subject being discussed. For instance, we do not think a red clay is as bad as it is made out to be." Nor do I. I have known red loams approximating to clay in tenacious properties with skilful culture and manuring, and additions of lime, to yield heavy crops. D. T. F.

RAINFALL IN EAST SUSSEX IN 1899.—The following is the total rainfall for the past year—23·08. During September the fall was heaviest, it being 4·10; and August witnessed the least, viz., 0·57. Wm. Camm, Battle Abbey Gardens.

YELLOW-FLESHED AND UP-TO-DATE POTATOS.—Having considerable sympathy with Mr. Harrison Weir in his quest for yellow-fleshed Potatoes, I am rather sorry that he could not pursue his hobby without wasting his energy in a needless attempt to remove from our lists and markets the variety Up-to-Date, one of the finest white-fleshed Potatoes in existence. Given wise culture, and careful cooking, there is no fear of this superb Potato proving tasteless, or choking your distinguished correspondent with its balls of flour. Up-to-Date sells about second in price, or equal to Dunbar Main Crop or other prime sorts. Yellow-fleshed or coloured-skinned Potatoes are not popular—hardly saleable in our markets. The flesh and skin must be sweet as a nut, and white as driven snow, cooked and uncooked. Clarke's Maincrop, which I grew for years, is still one of the best of the Champion class, and is a fine doer and cropper, as is likewise Stourbridge Glory. But having grown and eaten Up-to-Date from a very early stage in its history, and finding it specially good in cropping, constitution, eating, and disease-resisting, I have strongly recommended it in technical education lectures, &c., and never heard a single complaint against it before. Should Mr. Harrison Weir succeed in giving us a golden-fleshed Potato equal in constitution, cropping, and flavour, to Up-to-Date, not a few of us would welcome his success in this new field. D. T. Fish. P.S.—The above was written some days before the *Gardeners' Chronicle* for December 23 arrived. In the presence of Mr. Harrison Weir's genial face, and details of the distinguished life of your much honoured correspondent, one's first impulse is to withdraw all said about white or yellow-fleshed Potatoes; but second thoughts are not seldom best, and as you have shown us that Mr. Harrison Weir is a much abler gardener than most of us wot of, and has even won some of his horticultural spurs amid the mazes of double, treble, and multiple grafting, it may be best to

FIG. 3.—A SPECIMEN PLANT OF SOUVENIR DE LA MALMAISON CARNATION, AS GROWN IN THE GARDENS OF C. DYSON PERRIN, ESQ., DAVENHAM BANK, MALVERN. (SEE P. 10.)

garden routine as mowing lawns is in the summer, and with what excellent results? How many gardeners are there who found last summer salvation for their crops in the deep trenching of the soil, and consequent retention of moisture, small as it may have been, and deep root action on the part of crops. In many gardens the crops produced on such soils surprised the gardeners themselves, and served to enforce the lesson for good that trenching teaches. But in such high-class gardens not only is it the rule to trench largely and deeply but also to manure deeply, for roots seem to as instinctively seek for manure when low down as a hungry dog does for a buried bone. I have read of persons objecting to the practice of burying manure deeply, on the ground that roots would not benefit by it.

manured trenches, yet seem unable to grasp the fact that similar culture given to Onions, Cabbage, Potatoes, or indeed anything else, would have similar good results. In one large garden attached to a Boys' Home I once observed that a trench three feet wide and of the same depth was always kept open in the vegetable quarters, and into the bottom was placed all the lawn mowings, hedge or shrub trimmings, and general garden refuse, twelve inches deep, then trodden down, and the next trench of soil thrown upon it. This method of disposing of refuse was adopted partially from sanitary motives and partly from cultural ones, but the results were great so far as crops were concerned. Those who have at hand ample supplies of animal manure and leaf-soil may prefer to burn their rub-

hold him to the challenge already given—that of providing us with a golden-fleshed Potato, equal in quality and profit to Up-to-Date. Then shall we all join in your generous wish with one addition. Long may he continue to be as one—

“Who loveth well

Both man, and bird, and beast,
And golden-fleshed Potatoes!”

D. T. Fish.

COE'S GOLDEN DROP PLUM.—I do not know how late this excellent Plum can be kept, not having seen it later than November, but I can endorse what has been said by my old friend, Mr. Fish, that it is a fine bearer, and one of the most valued of Plums. I have practised gardening in seven counties in England from my youth upwards, and this Plum was considered to be one of the best and most profitable. In Wilts, Oxford, and Suffolk, it was found in most gardens in various aspects, and did capably against north walls. I have not seen it on north walls in Scotland, and would be glad to know if it succeeds in northern aspects beyond the Tweed. I have not seen any Plum, apart from those upon walls, succeed in north Scotland, except Victoria. How have Plums succeeded as standards or bushes at Gordon Castle?—where much attention has been given to their culture by the late Mr. Webster, and by his son, the present gardener at that fine place? I have seen Peaches and other fruits do well along the Moray Firth coast, which succeed indifferently in the midland and southern counties of Scotland. I know well the good effect of keeping the roots high, and preventing their downward growth in counties not favourable to choice fruit cultivation. M. Temple, Carron, N.B.

INFLUENCE OF STOCK UPON VINES.—This is an old but important subject. It is many years since I inarched Vines (I prefer this method to ordinary grafting), and have always seen the effect of the stock in some form. Muscat Hamburgs on Black Hamburg, Golden Hamburg on Esperiones, Duchess of Buccleuch on West St. Peter's, are some of the amalgamations that gave satisfaction, by increased size of berry and greater flavour. Before me at the present time (while bottling Grapes for late use) are some examples of Grapes that have been grafted on stocks which influence fruit and foliage. Gros Colman inarched on White Tokay are always large in berry and fairly coloured generally, but they are less juicy than those on their own roots, and take at least a month longer to ripen. They often swell to 1½ in. in diameter. Gros Colmar on Gros Guillaume are smaller than on their own roots. The berries are very round, and always colour well, but the flavour is not equal. Mrs. Pince grafted on Gros Guillaume are smaller in berry than on their own roots, firmer, and colour well. I consider Gros Guillaume one of the worst stocks on which to ingraft other Vines. Duke of Buccleuch on a Black Hamburg does fairly well, but not better than on its own roots. This Grape assumes a beautiful golden colour when left fully exposed to the sun from the first formation of the berry. Spotting is often caused by shading the fruit in their early stages. M. Temple, Carron, N.B.

JERUSALEM ARTICHOKE.—There are great quantities sold during the season in Covent Garden Market, usually in bushel baskets or sieves. Of the two varieties known to the writer, one pink and the other white, the latter has recently commanded the best trade, because they have been of larger size, and better shape. Other points equal, colour is not of much consequence. Some growers seem to think anything will do to send to London; but it is a great mistake, as there have been recently many parcels of ill-shaped tubers quite unsaleable. Artichokes for sale in Covent Garden should be of large size, perfect shape, and smooth. T. P., Covent Garden.

THE “HATFIELD” CURE FOR RED-SPIDER.—The above title accompanied a note in the *Gardener's Chronicle* for December 16, from Mr. R. Dean, who paid me a visit in the evening of September 2 last. The vineries were inspected in common with the rest of the gardens, and one of these was being fumed with sulphur for the destruction of the troublesome pest red-spider. This interested Mr. Dean. I do not claim to be the first to fume with sulphur direct over fire for the destruction of red-spider. I have read of it and heard of it from growers. Believing that fumes from sulphur was the one means of destroy-

ing red-spider on Vines without burning the leaves or disfiguring the fruit upon the Vines, I resolved to try it myself. The thought occurred to me that Richards' system for fuming tobacco juice would answer equally for sulphur, and I have found it answers admirably. Mr. Richards' large-size lamp, and cylinder for covering lamp, with a tin (baking-tin) formed my apparatus. Besides the baking-tin for containing sulphur, I used other receptacles, such as saucepan-lids, and lids from canisters. In my second vinery last season, when the Grapes were approaching the stoning stage, red-spider was found at one end. The vinery is 27 feet by 17 feet. I began experimenting by fuming sulphur, very cautiously, the first evening with one lamp. On examination the next morning. I found neither foliage nor spiders were affected. The next, and for some evenings afterwards, I increased the amount at the rate of one lamp at a time, up to eight lamps, beyond which strength I thought it was not safe to go. I was much delighted with the result. The following morning, after using eight lamps, not a live spider could be found, neither was a leaf scorched, nor a berry disfigured. The spiders infested the foliage about eight feet along the vinery. The yellow tint, from the effects of the spider, was markedly apparent, and remained so until the autumn; while the other foliage remained quite green. Other vineries, when the Grapes arrived at the stoning stage, were fumed on two evenings consecutively, or alternately, according to convenience, and at about the same strength, viz., one lamp to 800 or 900 cubic feet of space. During the remainder of the season the operation was repeated at intervals of two or three weeks, which kept the Vines clean to the last, without damaging any foliage, with the exception of one vinery, where the foliage was burned. This one occurrence was very trifling, when compared with success on upwards of fifty evenings. As well as vineries, I have fumed other houses, at the same strength, such as Peach-houses, after the fruit was gathered from the trees. The spread of spider was arrested without burning a leaf, or causing one to fall. My next trial was for scale on Palms, but I cannot say whether it did good or not. The same applies to rust on Carnations; but for white-fly on Tomatos this remedy is very effective. Sulphur, and the fumes from it, are very inflammable in nature, and a continual watch must be kept by a person standing outside the house. Practice taught me how to minimise the danger by regulating the height of the wick and quantity of sulphur, for preventing the flame spreading beyond the bottom, to the side of tin containing sulphur, merely allowing the sulphur to boil about 3 inches of space across the centre of tin. Should the sulphur get alight, it must be quickly extinguished, the wick lowered, and subsequently re-lighted. As I have said, I used Richards' large size lamps, a little more than half filled with methylated spirit, with the wick set about ¼ inch above the tube, and ½ pint of sulphur in each tin. I used two sizes of baking-tins, and one 6 inches across the top, 5 inches at bottom, and 2 inches deep, answered the better. The quantity of spirit and the wick, regulated as described, burns about two hours. In the future, if I increase the strength for any purpose, I shall do this by increasing the duration of the fuming, by replacing the burned-out lamps with others retimmed, rather than by increasing the number of lamps. In addition to the usual winter cleaning of my vineries, while the Vines are at rest, I intend to fume them. Fuming with sulphur is but another phrase for boiling it, or causing it to throw off gas in the form of vapour. This vapour fills the atmosphere and condenses on all surfaces, therefore it reaches all insects. The morning following fuming small crystals are visible on the surface of Vine leaves, and there is a film on the surface of the water in tanks. During the thirty-eight years I have lived in gardens, most of the methods of applying sulphur for the destruction of red-spider have come under my notice, I consider none is nearly so efficacious as the system I have described. It is inexpensive, easily effected, but needs continual oversight to prevent the sulphur flaming. Ventilation should be afforded a vinery, or any other house, very early in the morning after fuming. I believe the fuming system will become generally adopted in gardens where red-spider attacks Vines, and good clean Grapes are required. *George Norman, Hatfield Gardens, Herts.* [It requires the most careful management, or the consequences may be serious. Ed.]

VARIATIONS PRODUCED BY GRAFTING, AND THEIR INHERITANCE.

ALLUSION has already been made in these columns to Monsieur Lucien Daniel's contributions upon the subject of grafting. The paper embodying the whole of his researches is, however, worthy of the more detailed consideration which we may now give to it.

Grafting, says Monsieur Daniel, has long been compared with the making of a cutting, and in so much as in both processes a shoot is caused to grow independently of the plant which produced it, the two are alike, but here the similarity ends. There can be no tendencies towards variation capable of manifesting themselves in the cutting which did not previously exist in the individual from which it was taken. On the contrary, in grafting, the author points out, there are many incitements to variation acting and re-acting upon scion and stock, in the shape of the altered circumstances in which both find themselves. Among these are changes in the amount and nature of the crude sap supplied to the scion by the stock, and of the elaborated food given in return, as well as the fact that either component of the new plant may begin or relinquish active growth independently of the other.

Furthermore it is argued, under such conditions of growth, the actual living matter of the plants is likely to be modified, and should this change be admitted, there arises a number of questions of no less importance to the horticulturist and agriculturist than to the scientific worker.

The problems to be solved deal with the extent of such variation as is due to grafting. Does this, it must be asked, show itself on the surface? Are both, or is only one of the plants, affected? and are the modifications only such as would occur if normal plants were subjected to changes of nutrition in the ordinary course of events?

Again, are varietal or specific characters altered? If so, does the modification touch them permanently or for a time only, individually or collectively? Lastly, are only the bodies of the plants concerned, or are the pollen-grains and egg-cells acted upon, and will the new characters in the latter case be hereditary? The answering of these questions would appear to be simplicity itself, but unfortunately, it involves the exceedingly vexed question as to whether features acquired during the lifetime of an individual can be transmitted to its offspring, and we are brought face to face with a great diversity of opinion among practical men, botanists, and particularly philosophic naturalists.

For instance, some practical workers still regard grafting as belonging to the realms of the marvellous, believing, with the ancient classical writers, that all species can be radically changed at will. In this case some special influence must constantly be at work, and must make itself felt in a very important degree. Baltet says that grafting is federation in which both parties retain their own government.

E. A. Carrière and André consider graft hybrids to be an impossibility; but leaving practical men, Van Tieghem, summing up current opinion, says that grafting is a valuable method of fixing and preserving congenital variations, seeing that by this means further variation is prevented. Dr. Vöchting goes further, and relegates all the facts hitherto recorded on the influence of stock on scion, or scion on stock, to the category of old wives' tales, saying that no such special effect has been demonstrated. M. Daniel concludes this series of opinions by adding that Weismann holds all transmissible variations to have a sexual origin, a belief which Bailey does not agree with, basing his contention upon bud variations, while others from the animal side have come to similar conclusions.

It is allowed in the paper under consideration that those who join the swelling ranks of Weismann's followers have just cause in refusing to

* *Annales des Sciences Naturelles Botany*. Series 8, vol. viii. (1898), pp. 1-226, pls. l.-x.

acknowledge the experiments advanced against their theory, for these are not by any means precise. Any further evidence, M. Daniel says rightly, must not be open to similar criticism, and the experiments upon the subject which he has been conducting since 1890 have been strictly comparative. He has always planted side by side with his grafts, in like conditions as to soil, climate, and so on, other "control" plants of the same varieties as the stock and scion. In this way variations due to external environment should be easily determined, and consequently those directly due to grafting.

After the point, that one positive fact may at once get rid of a mass of negative evidence has been emphasised, M. Daniel proceeds to discuss his results under a number of headings and detailed sub-headings.

Variations in the plants themselves may be due either to altered nutrition or to a mixing of the

of the control plants. The graft swelling was marked, the number of leaves small, and their colour pale like that of Haricots grown in a dry or badly-manured soil. In others, where secondary tissues play an important part, the normal size was attained. Cabbages grafted upon themselves grew as big as usual, and the graft swelling practically disappeared. This happened when stock and scion, or even the former alone, were vigorous, but when the stock was weak and the scion strong, the graft made but slow progress.

The results obtained by grafting plants of the same race, and of different races, species, or genera, are next described. The case of a free-growing Haricot Bean as scion, and a dwarf one as stock, has a special practical interest, for a well-branched plant of 6 or 7 feet in height, such as was obtained, is much more suitable for a garden than a straggling one two and a half times as big.

while ungrafted White-thorns have only a maximum diameter of 15 cents. (5 inches).

In the next place, reference is made to the grafting of species requiring a flinty soil upon those which prefer a calcareous one, and *vice versa*. The growing of Pines, which object to chalky ground, on stocks of *Pinus sylvestris*, is alluded to, as well as M. Quintan's idea of grafting the Chestnut upon the Oak, in order to give it more chance of warding off the ills that attack it when growing in a chalky soil. It is further pointed out that the various American Vines are not all suitable as stocks for French ones in every locality, and the one must be found by experiment which gives the best result with each soil and each scion.

In grafting plants that are variegated, the less the amount of chlorophyll the more difficult is it to gain success, and an attempt to use a completely etiolated branch always ends in failure. A reference to M. Daniels' first two figures will show what differences may be expected on the habit of a grafted tree, according as leading shoots growing away from the pull of gravity, or lateral branches which have lost the power, are used as scions. In the first case, the resulting Pear-tree, with erect branches, is a marked contrast to the other, where the boughs may rise, but little or ever droop.

Lastly, under this heading, the subject of grafting fruit branches on principal branches is broached, and this was done in the experiments, not only when the parts to be improved upon were woody branches as is customary in practice, but when these were young scions.

§ 2. *Variations produced in the form, chemical constitution, and flavour of edible parts of grafted plants.*—Experiments in grafting Cabbages are described at some length. In some kinds the leaves became more brittle; in others, the flavour was made less bitter and pleasanter to the taste. Generally speaking, vegetative parts showed a diminution in size, and in practice it would be necessary to secure an improvement in quality to counterbalance this.

Coming to reproductive parts, it was found that the grafting of the Cauliflower on the Cabbage cannot be used for the direct improvement of the former, as the flower-bearing branches lengthen. On the other hand, the round, yellow Tomato grafted on the large and early red variety produced fruit half as large again as those of the control plants. This is of special practical interest, as the yellow fruit is excellent but small. In a second case also the same result was obtained. Carrot fruits produced by the wild variety grafted on the cultivated one in the absence of any pollen of the latter, were almost double the size of those of the control plants. No general rule can be laid down with regard to herbaceous plants in this respect, but it is pointed out that the perfection of the graft union, and the amount of sap reaching the scion, is as of much importance as in the case of woody plants.

(To be continued.)

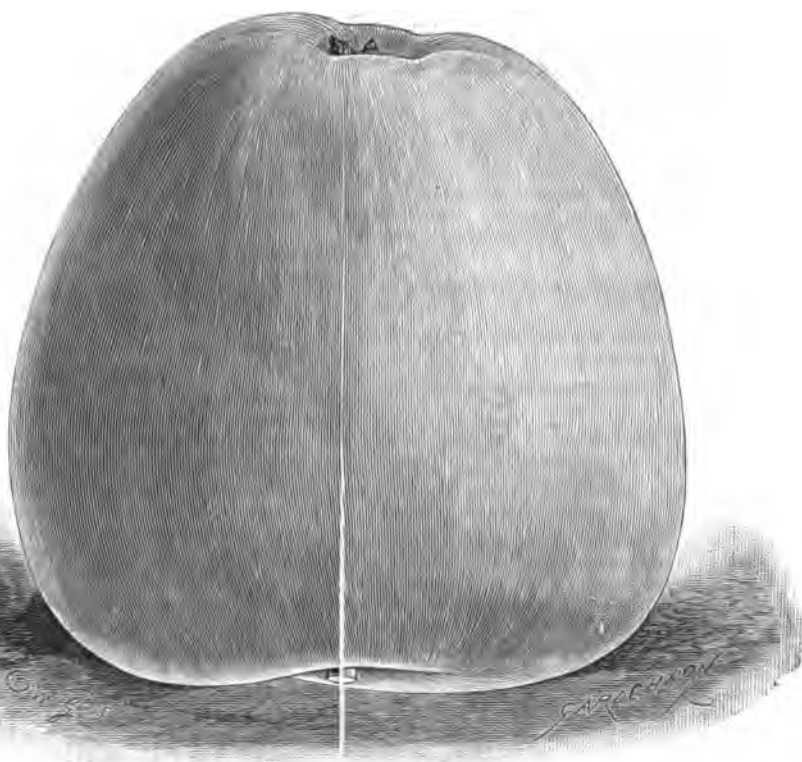

FIG. 4.—APPLE STANWAY SEEDLING.

(Given an Award of Merit at a meeting of the Royal Horticultural Society on December 19.)

characters of the two grafted individuals, but it is by no means easy in every case to separate one series from the other.

In considering variations due to nutrition, M. Daniel first gives an account of what takes place before looking for a further explanation. Four main divisions are made which it will be advisable to consider separately:—

§ 1. *Changes in the size of Scion and Stock.*—The dwarfing effects of grafting are, of course, noticeable in very many plants. Others attain their usual size, while this may even be exceeded in rare cases, where greater vigour is the result. To show that stunting is merely due to the difficulties put into the way of successful growth by the swollen tissues at the graft junction, plants were grafted on themselves, and so any chances of difference that might be looked for in two individual plants, even of the same race, were eliminated. Herbaceous plants, such as the Haricot Bean, which have but little secondary wood, when grafted upon themselves, reached only half the size

The age of the stock has a bearing on the success of herbaceous grafting, for a Lettuce scion, say has no power to get nourishment from the "ripened" branch of a Salsafy; it cannot render the reserve food in the stock available, and so perishes. On the other hand, when the Salsafy branch is at the period of maximum absorption, a junction may be successfully made with the Lettuce.

In grafting woody plants upon themselves, the effects of the swollen union are at first the same as in herbaceous ones. These wear off in time; and so the prevalent idea may have arisen that the grafting of a plant upon itself never gives rise to varieties. It may be interesting to note the cases given where grafting causes abnormal vigour. This happens when a shoot of the Silver Lime is inserted into the common species. Grafts of a Service-tree on White-thorn in the public garden at Château Gontier were made about 1840. One specimen arising from a single scion has attained a diameter of 30 centimetres (10 inches), another from two scions, that of 40 cents. (15 inches):

APPLE STANWAY SEEDLING.

NOTWITHSTANDING the long list of good Apples already possessed, a considerable number of dessert and culinary varieties have been given during the last few months Awards of Merit by the Fruit and Vegetable Committee of the Royal Horticultural Society. Each of these has, no doubt, some recommendation for a place among first-class varieties, or the Committee would not be likely to grant these distinguishing awards. The latest to satisfy the Committee was Stanway Seedling, shown in fig. 4. It is a good kitchen fruit, of moderate size, and its usual form may be seen from our illustration. Its colour is yellow throughout. Eye closed, or nearly so, and inserted in a moderately deep basin, slightly ribbed. The stem is short, set in a green and russet-lined cavity, with a swelling upon one side. The fruits shown before the Royal Horticultural Society were from Mr. T. H. Kettle, King's Ford, Colchester.

LAW NOTES.

COMPENSATION FOR CROPS.
INTERESTING TO ALLOTMENT HOLDERS.

A CASE of great interest to holders of gardens and allotments came before Mr. A. H. Smee at the Croydon County Bench on Thursday, December 21. It was a claim under the Allotments and Cottage Gardens Act, 1887, for compensation for crops, the Act providing that where a tenant should be given notice to leave his land he should be paid by the landlord for the value of the crop then on the land, or for the labour expended and manure used in preparation for a future crop. This appeared to be the first case taken under this particular Act, and it came before the Bench by reason of the fact that the parties were unable to agree to a settlement or to the appointment of an arbitrator. In such a case the Act provides that the magistrates shall appoint an arbitrator, and in this instance the Bench appointed Mr. A. H. Smee.

Mr. A. H. Smee duly held his enquiry into the circumstances of the case.

Prior to the case being opened, Mr. Smee said he had been appointed as arbitrator by the magistrates. He did not himself know any precedent for these proceedings, and he should be glad if the solicitors on either side could refer him in their experience to cases similar to this. To his mind it was very unfortunate that this application had not been made earlier, for at the present time they all knew that the crops would have ceased to exist, or had been considerably reduced in value by frost and other things. What he proposed to do, and what he hoped would meet with the approval of the solicitors, was to take item by item and see the amount of good that had been under different specific cultivation. It seemed to him, looking at the Act, that he had to value the crops not as on a particular day, but as to the value when they would come to maturity. He would like to bring it to their notice that in connection with some allotment ground he had sold to the Rural District Council it was found necessary by the requirements of the Allotments Act that the tenant should be given notice to clear, and six months notice was given. He had made it a practice to look round the allotments in the district every year, between July 1 and August Bank Holiday, and from his experience as a horticulturist, he was able to judge of the state of the crops in the district, and he thought it would be a fair thing if he considered this claim on the basis of the average crops, unless the plaintiff could on the one side prove to him that his crops were superior to the average, or unless the defendant could prove that they were inferior.

Mr. NEWNHAM said that as far as his experience went, he could not refer the arbitrator to a previous case. In his view the crops should be valued as on the date of the determination of the tenancy as between the incoming and the outgoing tenant. As to Mr. Smee giving six months' notice to his tenants, that was more a matter of convenience, as it was not compulsory according to the Act.

Mr. STOKES, the solicitor for the other side, said that it was necessary to take the value of the crops at the termination of the tenancy, and not what the crops might become.

The arbitrator said he considered it important as establishing a principle. He took it that the Act meant that the man should have full market value of the crop.

After further discussion, Mr. NEWNHAM, for the claimant, said that Mr. JAMES COOPER, the plaintiff, had been a weekly tenant to Mr. CHANDLER, of Croydon, of about three-quarters of an acre of land in Pound Street, Croydon. The land had originally belonged to Mr. Cooper as his freehold until March 15 in this year. He then sold it to Mr. Chandler, and an agreement was entered into between the parties by which Mr. Cooper became the tenant at a rental of 2s. a week, and this tenancy Mr. Chandler determined with a week's notice, which ended July 4.

The clerk (Mr. STAYNER) pointed out that it was unusual to have gardens or allotments at a weekly tenancy.

Mr. NEWNHAM—Defendant gave a week's notice, and turned the plaintiff out at once. He allowed him no more time.

THE ARBITRATOR—I cannot understand why it should be considered as a weekly tenancy when a man enters into a series of operations for the cultivation of land; he should not be expected to give up at any moment.

Mr. NEWNHAM—Having given a week's notice, the landlord excluded the tenant from the ground and let it to someone else. He was not allowed to return to it.

THE ARBITRATOR—I think I have to determine what the compensation should be for turning a man out in the most busy time of the year, when he would be particularly occupied in the garden.

After some further discussion of technical matters, the Arbitrator suggested that, as it was likely to be a troublesome case, the parties should try to settle the matter among themselves without going further into the matter.

A short adjournment was made, but no agreement being arrived at, the case proceeded.

Mr. COOPER then gave evidence in great detail as to the nature of the crops, the variety of plants, seeds, bushes, trees, &c., the amount of land occupied by each, and the price he expected they would have fetched.

Cross-examined—He denied that he was told when he left the garden and the house adjoining that he could take the crops off, and that he said he was going to get £210 or £200 out of Mr. Chandler.

FRED SMITH, a nurseryman, of Carehalton Road, gave expert evidence of the value of the crops, bearing out the statement of claimant.

THOMAS EVANS also gave evidence as to the value of the crops.

The present occupier of the land, a Mr. HALL, gave evidence for the other side. His evidence was to the effect that almost everything was a most utter failure. He admitted, in answer to Mr. NEWNHAM, that he never gave the ground any attention.

After the failure of another attempt to get the parties to come to an agreement,

THOMAS FREEMAN, a coachbuilder, gave evidence for Mr. Chandler, stating that he had bought fruit from the former occupier. He put the value of the crop lower than claimant, and said this year's was a poor one.

THE ARBITRATOR said that when he had particulars of the claim he took them home and went through them carefully and put down an amount which he thought was right. The only result of the inquiry would be to make him increase that sum by £1 perhaps. He had gone into this case most carefully, for the reasons he had given. He had spent a considerable time in horticultural pursuits, and he had endeavoured, as far as possible, feeling the great difficulty there was in estimating the value of crops which had perished, and crops that had not been gathered and turned into money, to arrive at an award which would be satisfactory to both. The sum he proposed was £16 10s., each side paying their own costs. The money was at once paid. Condensed from the Croydon Advertiser.

COLONIAL NOTES.

NOVA SCOTIA.

At the annual meeting of the Nova Scotia Fruit Growers' Association to be held from Jan. 27 to 31 inclusive, it is proposed to hold a representative exhibition of Apples, Pears, Quinces, Cranberries, &c. It is expected that the exhibition will be one of great excellence, although no money prizes will be offered. All fruit must be shown by the actual grower, and the fruit must be correctly named on labels 1 x 2½ in., secured to the plates, and type-writing is preferred.

SOCIETIES.

ROYAL DUBLIN.

DECEMBER 27.—Professor Johnson, F.L.S., gave a paper on the above date on some common food-plants. Speaking of the Potato, the Professor said that, though eaten in great quantities it was not a perfect food, chiefly due to the small quantities of nitrogen contained therein. The Sugar-Beet industry was referred to at some length. It was pointed out that its successful growing requires a high summer temperature, and that a recent crop of the Sugar-Beet raised in England was better, and the yield was more prolific than the German produce, of which we annually import something like £5,000,000 worth. This showed how the Germans had taken advantage of chemical and botanical help, and made it a national industry. The lecturer thought the incoming Board of Agriculture could do a very useful and necessary work by protecting the public against such adulterations as are now prevalent, and thereby secure for them wholesome food.

The lecture was illustrated by plants from the Botanic Gardens, Glasnevin; and the foods were represented by dried specimens from the herbarium attached to the Dublin Museum. On the following Thursday, Prof. Johnson spoke about some of the enemies of food-plants. The lecturer alluded to the results of experiments carried out in Trinidad on the Sugar-cane, and new varieties raised by seed selection, have been found free from disease, and yielded on the average 25 per cent. more Sugar than formerly, when cuttings were usually taken from the exhausted canes. Prof. Johnson stated the losses caused by rust in the United States is £8,000,000, and to Oat-smut alone £4,000,000. Unfortunately, in Great Britain there is no official reports as to such losses. He advised that experimental stations be erected throughout the country; by that means, science would be enabled to remove prevailing prejudices. A very effective series of slides illustrative of the several diseases were shown, which largely helped the audience to follow the lecture.

NATIONAL CARNATION & PICOTEE.

On the occasion of the last annual meeting of the above Society in December, some important additions were made to the schedule of prizes to be offered for competition at the usual exhibition to be held on July 25 next, this fixture being subject to alteration according as the incidence of the season may determine. These additions raise the aggregate sum offered in cash to £300, and four Silver Cups are offered instead of three, as last year.

In the first or open division, the class for twelve Picotee blooms, yellow grounds, has been raised to twenty-four blooms in twelve varieties, this section of Carnations having received so many valuable additions during the past few years. In the same division, the class for six blooms of any variety of fancy Carnations, the flowers are now restricted to yellow or buff grounds; and a new class is provided for a similar stand of other than yellow or buff grounds. In the second division, the class for six yellow-ground Picotees is extended to twelve blooms in six dissimilar varieties; and four new classes are added, viz., for six blooms of any variety of self Carnations, six blooms of any yellow or buff-ground fancy, the same number of blooms of any fancy Carnations other than yellow or buff, and for six blooms of any variety of yellow-ground Picotee. In the third division a class for four yellow-ground Picotees is made into six blooms dissimilar; the class for three blooms of fancy Carnations, one variety, is now made to read yellow and buff grounds; and a new class is added for three blooms of one variety other than yellow and buff.

In the classes for undressed blooms, that for twelve distinct varieties of Carnations, selfs, and fancies, three blooms of each, shown in bottles, is confined to competition in the first division; that for six varieties to the second division; and that for three blooms to the third division. The fourth Silver Cup is given for competition in five classes of undressed blooms; and in divisions one, two, and three, where Silver Cups are also awarded, the winning of such Cups is decided by the aggregate number of points secured in each division. In all classes down to and including twelve dressed blooms, a 1st prize is awarded twelve points, a 2nd eight, and a 3rd four. Six points are allowed for a 1st prize for six blooms, four for a 2nd, and two for a 3rd. Every premier bloom in divisions one and two carries four points; in the classes for single blooms a 1st prize carries three points, a 2nd two, and a 3rd one. In the third division, for the growers of small collections, twelve, eight, and four points are severally awarded to 1st, 2nd, and 3rd prizes; eight, five, and three, to six blooms; and six, four, and two, for two blooms.

It will thus be seen there have been considerable additions to the schedule of prizes; and, while it would appear that the Northern Section of the Society can barely pay its way, that in the south can boast of something like affluence; but it should be stated the flourishing financial condition is greatly owing to the warm interest taken in the Society by its President, Mr. Martin R. Smith, and his great liberality. R. D.

IPSWICH AND EAST OF ENGLAND
HORTICULTURAL.

DECEMBER 28.—The annual meeting was held on the above date at the Town Hall, Ipswich.

The financial report was freely criticised, and several members were of the opinion that the committee had spent more money during the year than they were justified in doing, the reserve fund having been reduced by nearly one-half. Mr. W. E. Close proposed to increase the usefulness of the society by the organisation of twelve meetings during the winter months for lectures and debates upon horticultural subjects. This very wise proposition is to be considered at a general meeting of the committee. A horticultural society's work should not begin and end with the holding of exhibitions.

Capt. Pretyman was re-elected President; and Mr. H. E. Archer as Secretary.

MISCELLANEOUS SOCIETIES.

Reading and District Gardeners'.—The annual general meeting was held on Monday, the 1st inst., and was well attended. The President, C. B. Stevens, Esq., occupying the chair. Before the usual business was commenced, the President announced the judges' awards in connection with the Essays arranged during 1899. They were as follows:—"The Planting of a Garden with Fruit Trees and Bushes," open to all, 1st (80s.), Mr. G. HINTON, The Gardens, Walmer, Reading; 2nd (20s.), Mr. E. TROLOPE, The Gardens, Coombe Lodge, Whiteburch; 3rd (10s.), Mr. C. P. CRETCHLEY, The Gardens, The Honeys, Twyford. "Plants suitable for Table or Room Decoration, and their Culture," open to assistant gardeners only, 1st, Mr. J. BORTLEY, The Gardens, Blythwood, Maidenhead; 2nd (20s.), Mr. C. TOWNSEND, Whiteknights Gardens, Reading; 3rd, Mr. T. PEMBROKE, Greenlands Gardens, Reading. The annual report and balance sheet was read by the secretary, and was of a very encouraging character, showing that the Association was in a very prosperous condition. The election of officers for the ensuing year was then proceeded with. C. B. Stevens, Esq., was unanimously re-elected President (fourth year), and Mr. H. G. Cox, Fernies, Junction Road, Reading, was re-elected Hon. Secretary. A feature of the meeting was a display of Primulas from Mr. Townsend, The Gardens, Sandhurst Lodge, showing some splendidly-flowered plants of *P. obconica* rose; Mr. F. Lever, The Gardens, Hilsdale, showed some well grown *P. sinensis* in small pots, as well as some good plants of *Lachenalia pendula*.

PRESENTATION TO MR. HERRIN.—Our valued correspondent, Mr. C. HERRIN, whose retirement from the position of gardener at Dropmore, Maidenhead, has been previously announced in these pages, was presented on the 29th ult. with a fourteen-day Timepiece. This was given on behalf of the employees in Dropmore Gardens, all of whom entertain very great respect for their chief.

FAMOUS AMERICAN TREES.—Some interesting facts are given by a New York correspondent respecting famous American trees. The writer says that probably the choicest tree in any of the city parks is the Cedar of Lebanon in Prospect Park. It stands on the meadow north-east of Lookout Hill. The height, about 40 feet, is remarkable for this country, and it would be no mean comparison to some of the famous ones at Kew. It is claimed that there is only one fine Cedar of Lebanon in the United States. It is on C. P. Huntingdon's estate at Westchester, and is about 60 feet high. These trees are most attractive in the early summer, when the old and new cones hang pendent (?) together.

THE PADUA BOTANIC GARDEN.—A correspondent in the *Botanical Gazette* writes that the Botanical Gardens at Padua, Italy, are rich in interesting plants. Classic plants are a *Chamaerops humilis*, L., var. *arborescens*, 9.5 metres high, planted about 1585, and visited September 27, 1796, by Goethe, wherefore it is known as "Goethe's Palm-tree;" a *Tecoma grandiflora*, Del., admired by Goethe for its beautiful flowering; a very old *Vitex Agnus-castus*, L. (about 345 years old); an *Araucaria excelsa*, R. Br., 20 metres high, kept in a special greenhouse; many very beautiful trees (*Gymnocladus canadensis*, Lam., *Giukgo biloba*, L., *Diospyros Lotus*, L., *Carya oliviformis*, Nutt., &c.). The greenhouses also are furnished with beautiful plants, among them an *Astrocaryon Chonta*, Mart., a *Cycas circinalis*, L., a *Cycas revoluta*, Thunb., a *Pandanus utilis*, Bory, a *Livistona australis*, R. Br., many *Cactaceae* and *Orchideae*. More than 5700 plants are cultivated in pots, to which we must add 110 old trees in the open air, 412 younger trees and shrubs, and 26 old greenhouse trees.

WINTER-GRAFTING.—Mr. A. IDE, in the last number of the *Tijdschrift voor Tuinbouw*, remarks that while formerly spring was thought to be the only period of the year at which grafting could be advantageously practised, now it is found that most plants, even fruit trees, may be grafted in winter. The advantage is, that the work may be done at seasons when work is slack in the nurseries. In Holland, English grafting is practised, or inarching. In Germany, saddle-grafting. The *Tijdschrift* has, in this instance, adopted the excellent plan of giving a *résumé* in French, a plan we should be glad to see exclusively followed out in Dutch horticultural periodicals, as it already is in scientific journals.

INDIAN AZALEAS.—In some of the Ghent establishments as many as 100,000 plants are grafted each year. As soon as union is effected the plants are placed in frames in the open air. In the middle of May they are lifted from the frame and planted in dried leaves. Leaf-mould is not so advantageous. Weak liquid-manure judiciously used is beneficial. An illustration in the January number of the *Revue de l'Horticulture Belge* shows a plantation of Indian Azaleas in the open air in the nurseries of M. ED. PYNART.

Obituary.

ANDREW GREIG.—This well-known Scotsman, who died on December 7, was for twenty-eight years head of the nursery department of Messrs. Little & Ballantyne's business at Carlisle. He was a native of Aberdeenshire, and was brought up to gardening and forestry, first in Edinburgh, afterwards in the Perth nurseries. Upon leaving Perth, Mr. Greig was for some time in Leicester-shire, then at Annan, and subsequently with Messrs. John Stewart & Sons, Broughty Ferry, from whom he came to Knowelfield twenty-eight years ago. Deceased's practical knowledge of horticulture was extensive. Deceased is survived by his widow and two sons and a daughter.

Remarks.—A week of intermittent frost and rain, with brief spells of bright sunshine. There was a gale on the 29th ult.

THE WEEK ENDING DECEMBER 23.

The following summary record of the weather throughout the British Islands, for the week ending December 23, is furnished from the Meteorological Office:—

"The weather during this period was very dull and gloomy in all parts of the Kingdom. Slight rain and fog were frequently experienced in the south and south-east, and cold rain or sleet in the north. Over the south and west of Ireland rain fell daily, and was at times very heavy.

"The temperature was a few degrees below the mean generally, but slightly above it in 'Scotland, N.' and over Ireland. The highest of the maxima occurred at the end of the week over England, but some days earlier in Ireland and Scotland; they ranged from 56° in the 'Channel Islands' 53° in 'Ireland, S.', and 50° in 'England, S.W.' and 'Scotland, N.', to 45° in 'Scotland, E.' and 42° in 'England, E.' The lowest of the minima, which were recorded during the early days of the week, varied from 19° in 'Scotland, E.' and 'England, N.E.', and 22° in 'Scotland, N.' and 'England, S.', to 26° in 'Ireland, S.' and the 'Channel Islands.' The diurnal range was very slight generally, especially over England.

"The rainfall was less than the mean in most districts, but just equal to it in 'Scotland, E.', and more than the normal in 'England, N.E.' and over Ireland. In 'Ireland, S.' the excess was very large.

"The bright sunshine was very deficient everywhere, and in some of the northern districts was altogether absent."

THE WEEK ENDING DECEMBER 30.

"The weather during this period was very unsettled generally, with much rain in the more southern districts, and rain, sleet, or snow in the north. A few fine, clear intervals occurred, however, in most places. Thunder and lightning were experienced in the north of Scotland on Wednesday, and on our south-west coasts on Thursday.

"The temperature was below the mean in nearly all districts, but just equalled it in 'England, S.W.', and was rather above it in 'England, S.' and the 'Channel Islands.' Over Ireland the deficit amounted to 4°, and in Scotland to 4° or 5°. The highest of the maxima were recorded either at the commencement or towards the end of the period, and ranged from 53° in the 'Channel Islands,' and from 51° or 50° in several English districts, to 45° in 'Scotland, N.' and 'England, N.E.' About the middle part of the week the daily maxima were below 32° over the inland parts of Great Britain, the lowest being 26° at Stonyhurst. The absolute minima, which were registered on the 27th or 28th, ranged from 12° in 'Scotland, E. and W.', 18° in 'England, N.W.', 15° in 'Scotland, N.', and 17° in 'Ireland, N.', to 22° in 'Ireland, S.' and 37° in the 'Channel Islands.'

"The rainfall was more than the mean in all districts except 'England, E.', the excess over Ireland and most parts of England being large.

"The bright sunshine exceeded the mean generally. The percentage of the possible duration ranged from 39 in 'England, N.E.', and 27 in 'England, E.' and 'Ireland, S.', to 13 in 'Scotland, E.' and 8 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, JANUARY 4.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Main Crop, &c., 70s. to 90s.; Dunbar Up-to-Date, 100s.; Dunbar Main Crop, 110s. Other varieties, 65s. to 85s. John Bath, 82 & 84, Wellington Street.

REMARKS.—Since last report there has been a great advance in the price of Brussels Sprouts, Broccoli, and Spinach, but prices have fallen again a little. Mushrooms and Seakale are cheaper. In addition to other varieties of Onions, there are now some from Bordeaux in boxes. The bulbs are of high colour, have thin skins, are tender and mild. They are not so popular as the Valencia, and are small in comparison.

FRUIT AND VEGETABLES.

GLASGOW: January 3. — The following are the prices since our last: — Apples, Canadian, Kings, 26s. to 30s. per barrel; Baldwin, 19s. to 22s. do.; Northern Spy, 18s. to 22s. do.; Greening, 18s. to 22s. do.; Spitz, Seeks, Ben Davies, Waggoners, 16s. to 20s. do.; Calverts, Holland Pippins, 12s. to 16s. do.; American, Baldwin, 16s. to 18s. do.; Northern Spy, 16s. to 18s. do.; various sorts, 14s. to 17s. do.; Grapes, English, 1s. to 2s. 6d. per lb.; foreign, Almeida, 12s. to 16s. per barrel; best, 30s. to 25s. do.; Bananas, extras, 12s. to 14s. per bunch; No. 1, 10s. to 12s. do.; No. 2, 8s. to 10s. do.; others as low as 2s. do.; Oranges, Murcian, 7s. 6d. to 8s. 6d. per half case; 11s. to 14s. per case; Valencia, ordinary, 420's, 7s. to 10s. per box; large, 11s. to 12s. do.; extra large, 14s. to 16s. do.; Jumbos, 15s. to 18s. do.; large and extra large, 714's, 11s. to 14s. do.; Lemons, Palermo, 10s. to 12s. per case, and 7s. to 8s. per box; Pears, Californian, Easter Beurre, 18s. to 21s. per box; Newtown Pippins, 9s. to 12s. do.; Mushrooms, 1s. 6d. to 1s. 9d. per lb.; Tomatos, Tensiffe, deeps, 12 lb. to 16 lb., 2s. to 3s.; Onions, English, 6s. to 7s. per cwt.; do, Valencias, 5 in a row, 7s. 6d. per case; do., 4 in a row, 6s. to 7s. do.; Turnips, 6d. to 8d. per dozen bunches; Swedes, 1s. 6d. to 1s. 8d. per cwt.; Parsley, 6d. to 9d. per dozen bunches; Cabbages, 8d. to 1s. 4d. per dozen; Celery, 8d. to 1s. 6d. roll.

LIVERPOOL: January 3. Wholesale Vegetable Market.—Potatoes, per cwt., Lynn Greys, 3s. 4d. to 3s. 6d.; Main Crop, 3s. 9d. to 4s. 3d.; Bruce, 3s. 4d. to 3s. 10d.; Champions, 3s. 4d. to 3s. 8d.; Turnips, 6d. to 10d. per dozen bunches; Swedes, 1s. 6d. to 1s. 9d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 6d. to 8d. per dozen bunches; Onions, English, 6s. to 7s. per cwt.; foreign, 8s. 9d. to 4s. do.; Cabbages, 8d. to 1s. 6d. do. St. John's.—Potatoes, 1s. per peck; Grapes, English, 2s. 6d. per lb.; foreign, 8d. to 10d. do.; Pines, English, 5s. each; Cobnuts, 10d. per lb.; Cucumbers, 1s. 6d. each; Mushrooms, 1s. per lb. and basket. Birkenhead.—Potatoes, 10d. per peck; Filberts, 10d. per lb.; Grapes, English, 1s. 6d. to 3s. 6d. do.; foreign, 4d. to 8d. do.; Pines, English, 4s. to 8s. each; Mushrooms, 1s. to 1s. 6d. per lb.

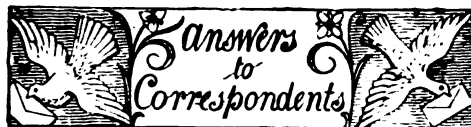

CORN.

AVERAGE PRICES of British Corn (per Imperial qr.), for the week ending December 30, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.		1899.		Difference.
	s. d.	s. d.	s. d.	s. d.

Barley	28	4	25	5	- 2 11
Oats	17	0	16	2	- 0 10

ENQUIRY.

A HOUSE FOR LILIES AND AQUATICS.—I am building a house for delicate Water-Lilies and aquatic plants; will any of the readers of the *Gardeners' Chronicle* give me information as to the interior arrangement necessary? The dimensions of the house are 30 feet by 13 feet. M. Lockwood, Col., M.P.

ARUMS: G. A. H. The spathe is not deformed, but they appear to have been checked in their growth. Try a little increased heat, and supply water to the roots.

CARNATION SEEDLINGS: H. E. Number one, but for its stronger stem, would hardly be distinguishable from the variety Uriah Pike. Whether the seedling has any advantages must depend upon its habit. As far as can be judged from the specimens sent of the primrose-coloured seedling, this is not of great value.

CYCLAMEN: C. F. L. The grubs are those of a weevil which are very destructive. Trap them with slices of Potato or Carrot, and destroy them. By way of prevention look to the soil you use; the loam should have been stacked at least two years before using. If the amount of soil you require is not too large, you should bake it before use.

DAPHNIPHYLLUM GLAUDESCENS: B. B. This plant is best propagated by seeds, which may be easily procured from Japanese nurserymen. Stocks in this country are sometimes, however, increased by means of cuttings.

DESIGNS FOR FLOWER-BEDS: C. J. D. Apply to Messrs. H. Cannell & Sons, Swanley, Kent, who issue a pamphlet upon the subject at the price of 6d.

EEL-WORMS: E. B. It is quite evident that there is a difference of opinion as to what these are. One correspondent writes:—"I cannot understand Mr. Editor's remarks that eel-worms are only of microscopic dimensions, as I have seen many thousands of eel-worms from 6 to 8 inches in length. . . . Immediately they are unearthed and thrown upon solid ground, they begin to leap and twist about exactly like an eel." We, in a moment of weakness, adopted a popular name instead of a much-reviled scientific one, with the amusing result above shown. We were alluding to nematoid worms of the genus *Tylenchus*, which are hardly visible to the naked eye, but which effect very great destruction to many crops. We have frequently given illustrations of the creature.

NAMES OF FRUITS: A. M. 1, Cockle Pippin; 2, Golden Winter Pearmain; 3, Pine-apple Russet; 4, Dr. Harvey; 5, Norfolk Stone Pippin; 6, Cobham.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. T. 1, *Impatiens parviflora*, an introduced plant; 2, not wild Medlar, but a *Crataegus*, perhaps *C. coccinea*, if so, it is not an aboriginal native.—G. M. C. *Odontoglossum bictonense*.

PHALLENOPSIS BUDS FAILING: Haywood. In districts where dense fogs have prevailed, Phalænopsis buds have frequently perished in the manner shown by your specimen. *Odontoglossum* leaves are also similarly affected, the older leaves often turning black, while those on the young growths remain green. Very similar effects have also followed when the hot-water pipes have been painted or tarred. A sudden fall in the temperature, even for a short time, might cause the damage.

ROSE DISEASED: C. W. D. The twigs and leaves are attacked by a fungus, which is neither Rose-rust nor Rose-mildew. The latter is present on leaves, but is not the cause of damage to the twigs. The fungus attacks the outer tissues of young twigs, and it can be traced in older twigs inwards to the wood. This destruction of the bark produces the scabbed or scurfy appearance. The fungus has minute spores or conidia, developed free on the surface and in dark cases (pycnidia). A disease almost identical has been described by the name "Anthracnose." The treatment is severe pruning of scabbed twigs, and repeated washing down of the shrubs in winter with sulphate of iron solution (water, 50 gallons; sulphuric acid, 1 pint; iron sulphate, 25 lb.; mixed in a wooden barrel), or with Bordeaux Mixture. The summer treatment is to spray with dilute Bordeaux Mixture at fortnightly intervals after the foliage has formed.

TENNIS COURT: C. J. D. A court for the single game, that is, for two persons, is 27 feet wide and 78 feet long. The court is divided across the centre by the net. The "service lines" are parallel to the net, and 21 feet distant from the same. A court for three-handed or four-handed games should be 36 feet wide, and the same length as the smaller court, and the posts for supporting the net should be placed 3 feet beyond the sides.

VINES DISEASED: S. H. The twigs are attacked by the black-rot. The discoloured, shrunk, and cracked patches at the base of this year's growths are full of a fungus mycelium, from which on cultivation we obtained spores contained in tiny dark pustules on or near the diseased parts. A description and figures of the fungus were given in the *Gardeners' Chronicle*, January 28, 1895. In the twigs sent the fungus seems to have entered through the wounds left when the Vines were pruned back; these cut ends are so near the buds that the fungus could easily make its way from the wound to the bud. Wounds like this require to be painted with tar or creosote as soon as made; they offer a doorway to many parasitic fungi. Was the disease not present last year, either like this, or as spots on leaves or fruit? It is a deep-seated disease, not easily checked. This season, prune all diseased shoots, and remove any spotted leaves or fruits when seen; they will die in any case, so need not be left. Spraying is known to check the disease on the Grapes. The solution is prepared by mixing 5 oz. of copper carbonate with water into a thin paste, add 3 pints of strong liquid ammonia; the liquid produced should be dark azure-blue, with little sediment; before use add 45 gallons of water. Spray the Vines both over and under, and at first repeat every fortnight, later every three weeks, till the Grapes are nearly full size. Neither leaves nor fruit should be discoloured by the spraying, if so, add more water to the liquid. Before the leaves unfold next season, the Vines should be sprayed several times, using the Bordeaux Mixture, which is stronger than that described above. It checks the fungus better, but cannot be used on young Vine foliage or Grapes. The house might also be carefully cleaned, and it might be well to consider if the Vines are properly treated in regard to drainage, &c., and that they are not overfed with strong manures.

WIREWORM: E. B. What you send is a millipede, known as *Julus terrestris*; they feed on decaying animal and vegetable matter. Trap them with slices of Mangold, and apply a dressing of soot to the land.

WOOD-LICE IN FERN-HOUSES: R. P. & Co. We know of no better means of ridding Fern-houses of this pest than the old custom of entrapping the creatures by means of Turnip, Potato, or other food of which they are known to be fond. Hollow out a few Potatoes and Turnips, and put them about the houses, hollow side down. If these be examined early in the morning or during the night, it will be found that many of the wood-lice have congregated in them, and by carefully removing each piece and shaking it over boiling-water, and setting it again as a trap, the number present in the house will soon be considerably reduced.

Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

GARDENING UNDER GLASS.*

By W. WATSON, ROYAL GARDENS, KEW.

(Concluded from p. 2.)

IF we compare the growth of plants in the open air in summer with that made by the same kinds of plants in shaded houses, the advantage is seen to be decidedly in favour of those grown in the open air; and although there is danger of burning or scalding where the glass is of bad quality, I am persuaded that if we shaded our glass-houses less, we should have better results. By shading we shut out the heat-rays as well as the light, and it is by no means an uncommon practice for gardeners to thus exclude the sun-heat, the essence of life to the plants, and to keep the water-pipes hot, the least healthy of conditions. Hot-water pipes are a necessary evil in a plant-house. An American writer has said, "The value of light in the growth of plants is not always fully appreciated. It is a common occurrence to see plants which require strong light for their development, struggling for existence in dark houses. Within recent years, however, there has been a marked improvement in the manner of constructing greenhouses, and there is no doubt that the improvement in many of the crops now grown can be attributed to the recognition of the fact that properly regulated light is one of the fundamental factors in the growth of plants under glass."

* From a Paper read at the Kew Mutual Improvement Society.

TEMPERATURES.

The requirements of almost all tender plants in regard to temperature are provided roughly by three grades, namely, (1) the stove temperature, which varies from a maximum governed by the time of year and the state of the weather, to a minimum in summer of about 70°, in winter about 60°; (2) the intermediate-house, the maximum for which varies as in the stove, whilst the minimum is 60° in summer, 50° in winter; (3) the greenhouse, which is practically an unheated structure, except when there is danger of the temperature falling below 40°. In the case of some plants it is desirable to deviate from these. Generally, we may say that the temperatures maintained in plant-houses vary between a maximum of from 50° to 90°, or even 100°, and a minimum of from freezing point to 65°. Whilst there are many indoor plants that are not injured by a few degrees of frost, nothing is gained by admitting frost into any glass structure.

With regard to the variation of temperature during the day and night, the practice in modern horticulture differs materially from that of earlier times. Then a regular temperature was aimed at, in the belief that it afforded the most favourable conditions. Knight, in a paper published in 1814, in the second volume of the *Transactions of the Royal Horticultural Society*, endeavoured to show the ill effects of excessive heat in forcing-houses during the night. He pointed to the mistake generally made by gardeners who, sensible of the comforts of a warm bed on a cold night, and of fresh air on a hot day, treated their plants to the same pleasures. The temperature of the plant-houses during the night, relatively to that of the day, was almost always much too high, and consequently highly injurious to the plants of temperate climes, especially fruit-trees, and not at all beneficial to those of tropical climates, where the temperature declined considerably during the night.

The difference between the temperature at evening and early morning in tropical countries is generally extreme, and in such distinctly tropical regions as Singapore, Jamaica, and Ceylon, it is usual to provide extra bed-clothes to be drawn on in the early morning. This fact has influenced our best indoor gardeners of to-day, and in the growing season the houses are syringed, closed early, and the sun allowed to increase the temperature considerably. During the night the temperature gradually falls, and in the morning, by 6 o'clock say, it reaches its minimum, a comparatively low one.

The importance of allowing the temperature to increase as the sunlight intensifies has already been touched upon. The evils of endeavouring to keep a house cool by excessive ventilation, especially at the top, must be evident to anyone who applies an elementary knowledge of physics to horticultural art.

"Each plant, each part of a plant, is best developed, and each function performed by it is carried on at a certain temperature, and is checked by excess or defect" (Masters). To know what this temperature is in the case of each plant is of importance. We endeavour to simplify this matter by classifying cultivated plants into stove, intermediate, and cool-house plants, as already pointed out, but the temperature must vary with the state or condition of the plant. An excellent rule, which applies to all plants more or less, is, that for a certain period in each year a rest from growth is beneficial. This rest is afforded by a reduction in

the supply of food, i.e., water, or by a lowering of the temperature, or by both.

Sachs has likened a plant to a steam-engine in its relation to heat. When the tension of the steam is slight, the machine is barely able to overcome the friction of its own parts, and under such circumstances can do little or no work. As the tension of the steam is increased the work increases also, until a point is reached when the maximum amount of work is done. Beyond this, the parts of the machine become strained, and a breakdown may result. In the case of the plant, there is a point in the temperature barely sufficient to induce growth. With increasing heat there is a corresponding increase of growth, until a point is reached when the best growth is made; beyond this point the growth may be quicker, but it is weak and lacking in stability. The best of our cultivators have learnt from experience what the optimum temperature for their plants is, and it is to this knowledge that the express cultures of the modern market-man are due. He will produce a fine healthy specimen in a year or two of a plant, which in the hands of the jog-trot cultivator would take five or ten years to grow to the same size, and which would probably be comparatively lean and scraggy. For his own purposes, the "express" man sometimes slightly exceeds the optimum temperature, but, as we know, plants thus produced are grown to sell, not to live. To recapitulate: temperatures during the day in the growing season might often be higher with advantage, and lower during the night; it is preferable to allow the temperature to rise above the normal under the influence of a hot sun, rather than attempt to keep it down by excessive ventilation; a high temperature with heavy shading must be avoided for healthy plants partial to sunlight.

WATER.

Careful, thoughtful watering is the key-note to success, and he who does not know how to water a plant cannot grow it. Given to excess the soil becomes stagnant, and a condition analogous to drowning animals is the result. The more water there is in the soil the less air it can contain, and as all plants, except aquatics, require air at the roots as well as water, if the soil is kept in a state of saturation air is excluded, and consequently the soil becomes sour. One essential condition for the active processes of oxidation and decomposition is, of course, the presence of air; an open porous soil is thus far more exposed to oxidation and nitrification than one in a closely consolidated condition: hence arises the beneficial effect of mixing porous substances, such as peat, charcoal, and sand, with stiff horticultural moulds. The operation of tillage also tends to promote in the soil oxidation of the organic matter, and assist in its nitrification. A sufficiency of water is essential for the activity of all living agents; oxidation and decay are thus far more rapid in a moist soil than in a dry one. The constant waterings given to plants in a well-conducted garden provides this condition. It must, however, be remembered that a great excess of water is fatal to oxidation, the admission of air being excluded as soon as the soil is filled with water. (Willis.)

A careful waterer can almost afford to be indifferent as to the quality of his soils. In my opinion, so long as its physical properties—texture, temperature, and moisture—are perfect, the quality of the soil in regard to many plants is of small importance. This is seen in the growth of many Orchids under conditions where moisture and air are the sole sources of food, a wood block, crocks, or living sphagnum being the medium through which they are

supplied. Of course, gross-feeding plants are best in a soil rich in foods; but I believe the foods could be afforded artificially, less conveniently, perhaps, if the roots were in sand. We know from experience that this is so. The point to be emphasised is, that water, rather than soil, is to plants what food is to animals, and a knowledge of the quantity, and time to supply it, required by a plant is of great importance. In the open air, Nature, supplemented by man generally, regulates these matters; but in glass-house gardening, where the whole of the conditions are artificially supplied, a knowledge of the part that water plays is essential. The careful waterer is a treasure in glasshouse gardening.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

SOLANUM WORSLEYI.

In this new plant we have one that is either closely allied as a species to *S. Melongena*, or an extreme varietal form of it. For its introduction (fig. 5, p. 19) we are indebted to Mr. Worsley, Mandeville House, Isleworth, who obtained seeds of it near Petropolis, Rio, where it is grown in the highlands by the country people, on the pillars and sides of verandas surrounding their houses. It is described by Mr. Worsley as a scandent plant, and as such he has grown it in his greenhouse, where the stems have attained a length of about 8 feet, and produced numerous fruits. The plant differs from all cultivated forms of *S. Melongena* (Aubergine, &c.), in being destitute of spines in its woody stem, and in the colour of the fruits, which, when ripe, are of a bright scarlet. They are developed singly or in pairs on stalks 2 inches long, and are about the size of a hen's egg. The leaves are ovate lanceolate, lobed, softly pubescent, 6 inches to 1 foot long. Mr. Worsley says that the fruits ripen in summer in Petropolis, and are cooked in a green state to serve as a vegetable, being held in high esteem by the natives. He found the fruits eaten in Brazil palatable, and possessed of tonic properties, whereas those produced at Isleworth were acrid and disagreeable; this, however, might be due to the slow development of the fruit, or to improper cooking. The plant is hardier than *S. Melongena*, and as hardy at least as the Tomato, with which it may be cultivated. It can be treated as an annual, but is probably perennial. This plant may be useful for the conservatory if grown in pots outside during the summer, and brought under glass to mature its fruits, which last a long time, and are very bright in colour. Examples of it may be seen at Kew. *W. W.*

TAGETES LEMMONI.*

We are indebted to Mr. Gumbleton for the opportunity of figuring this newly-introduced Marigold. It attains a height of 3 feet, and from the profusion of its yellow flowers is highly decorative. It is, we presume, a perennial, and was discovered by Mr. Lemmon in the Huachuca Mountains of Southern Arizona. We append Dr. Asa Gray's description, which, together with our illustration (fig. 6, p. 21), will supply all the details about the plant, except those which its cultivation may be expected to reveal.

* *Tagetes Lemmonii*.—Fere glaberrima, 2-3 pedalis; caulibus strictis superne subfastigiatis ramosis paniculato polyccephalis; foliis omnibus oppositis; foliolis 5-7 lanceolatis seu elliptico linearibus aequaliter serratis (lin. 2-4 latis, majoribus sequi-bipollicaribus); pedunculis breviusculis gracilibus subulatis bracteolatis; involucri oblongo campanulato subtruncato glandulis ovalibus oblongisve maculato; ligulis 6-8 semi-pollicaribus; corollae disci lobis, 4-6 imbricatis; pappi pileis brevibus inequalibus 1-3 subulatis ceteris 2-3 plo. longioribus.

Huachuca Mountains, S. Arizona, Lemmon. Asa Gray, in *Proc. Amer. Acad.*, xix. (1883), p. 40.

ORCHID NOTES AND GLEANINGS.

LINDENIA.

In the last number there are figures of:—

CATTLEYA TRIANELI, Lind. (var. *PLATYCHILA*, *CANDIDULA*, *LATISSIMA*), tab. 677.—The variety *platychila* has a very broad two-lobed lip, with a large anterior deep violet blotch in front of the yellow throat, the two side lobes of the lip do not meet, so that an open space is left, exposing the column as happens, we are told, constantly in *Cattleya Mantini* × var. *candidula*. Here, the anterior lobe of the lip is whitish, with a narrow purple blotch and a yellow throat; var. *latissima* has very broad undulate segments of a deep rose colour, the tip has a deep purple blotch in front of the yellow throat.

SOBRALIA XANTHOLEUCA, Hort., tab. 678.—Flowers of a citron-yellow, with the lip of a deeper tint. It is a native of Guatemala.

ODONTOGLOSSUM ASPERSUM (var. *BOSSCHERIANUM*), tab. 679.—This differs from the type in the brown sepals, narrowly edged with yellow. The spade-like lip is white.

PERISTERIA ELATA, Hook., tab. 681.—See *Gardeners' Chronicle*, December 23, 1889, fig. 155.

NOVELTIES OF 1899.

(Concluded from p. 4.)

STOVE AND GREENHOUSE PLANTS.—In all sections of plants most useful for decorative purposes great progress has been made. Each has been recruited by worthy novelties.

One of the best plants of the year was the brilliant and floriferous *Kalanchoe flammea*, a fine group of which was exhibited by the Director of the Royal Gardens, Kew, making one of the most admired objects at the Royal Horticultural Society's Show at the Chiswick Gardens, July 11, 1899.

In new and good hybrid *Amaryllids*, the amateurs have decidedly taken the lead. Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. Bain), has produced the handsome *Eucharis* × *Burfordensis*; Captain HOLFORD, of Westonbirt (gr., Mr. A. Chapman), whose collection of *Amaryllis* is the oldest and best in the country, received Certificates for *Hippeastrum Apple Blossom*, H. Murillo, H. Robin, and H. Virginia; while that careful worker in Nerines, H. J. ELWES, Esq., has for his best N. Miss Willmott, N. Mrs. Berkeley, and N. Mrs. Godman.

The *Begonias* have been recruited by good novelties in the tuberous section by Mr. T. S. Ware, R. Hartland & Son, and others; while the still more useful and almost perpetual-flowering *B. Gloire de Lorraine* is likely to become the forerunner of a separate section; the floriferous *B. Mrs. Leopold de Rothchild*, raised, or rather secured by selection, by Mr. Jas. Hudson, who also has a variegated form of it; and the white variety, *B. Caledonia*, of Mr. Forbes, of Hawick, being a good commencement.

Richardia suffusa, a new primrose-coloured *Calla*, with purple eye; and the rich orange *R. Pentlandi*, Tring Park variety, were certificated to the Right Hon. Lord ROTHSCHILD (gr., Mr. E. Hill).

Messrs. JAS. VEITCH & SONS have evolved new beauties from the showy *Phyllocacti*, *Amaryllis*, greenhouse *Rhododendrons*, and other handsome popular genera; and various other desirable novelties have appeared, many of which will be found in the appended list of new and rare plants, illustrated in the *Gardeners' Chronicle* in 1899.

CHRYSANTHEMUMS

have deservedly occupied much attention during 1899, and some thirty new varieties have been certificated, chiefly to the different specialists. There seems to be a laudable wish to advance the single-flowered section, which, if carefully pursued, would meet with good results.

AMONG FERNS

there have not been many novelties certificated, though some very useful garden-raised varieties for market purposes have appeared. The best certificated Fern of the year, perhaps, is the *Davallia illustris*, an elegant, finely-cut species, suitable either for large or small plants, for baskets, rockeries, or pots, shown by Messrs. JAS.

VEITCH & SONS. The others certificated are the distinct *Adiantum Burni*, and the finely-divided *Polystichum angulare divisilobum plumosissimum*, of Messrs. W. & J. BIRKENHEAD.

GARDEN FLOWERS, &c.

Of Carnations, Dahlias, Roses, Narcissi, Delphinium, Phloxes, &c., there have been numerous new varieties exhibited, many of which have possessed remarkable merit.

FLOWERING AND ORNAMENTAL SHRUBS.

Of flowering and ornamental shrubs and trees, there have been more varieties certificated than usual during the past year, a most gratifying circumstance.

The following novelties and rare plants were illustrated in the *Gardeners' Chronicle* in 1899:—

- Aster nanshanicus*, May 27, p. 331.
- Begonia Mary Pope*, June 3, p. 361.
- Begonia Jessie Pope*, June 3, p. 360.
- Campanula Mayi*, August 12, p. 127.
- Campanula mirabilis*, October 7, pp. 274-5.
- Chrysanthemum Mrs. Alfred Tate*, December 2, p. 419.
- Cereus candicans Dumesniliana*, December 2, p. 415.
- Cortaderia Lambleyi* fol. var., May 27, p. 335.
- Crinum Van Tubergen*, August 12, p. 131.
- Deutzia discolor purpurascens*, July 15, p. 43.
- Dianthera illustris*, May 27, p. 331.
- Dracæna Doucetii*, fol. var., May 13, p. 291.
- Dracæna Victoria*, October 21, p. 315.
- Echium candicans*, July 22, p. 71.
- Erythronium Johnsoni*, April 22, p. 253.
- Eucharis Burfordensis*, September 23, p. 247.
- Eucharis Stevensii*, September 23, p. 243.
- Eucharis Elmetiana*, November 4, p. 345.
- Fouquieria columnaris*, October 7, p. 277.
- Galanthus Cassalia*, March 18, p. 165.
- Grape Lady Hastings*, Black Muscat, August 19, p. 157.
- Gymnogramma schizophylla prolifera*, Supplement, June 3.
- Iris Sofrana*, November 29, p. 391.
- Kalanchoe flammea*, July 15, p. 47.
- Lowrya campanulata*, February 25, p. 117.
- Narcissus King Alfred*, April 8, p. 221.
- Nepenthes Balfouriana*, July 29, p. 91.
- Nerine Miss Willmott*, November 29, p. 399.
- Passiflora Margaret Wilson*, February 11, p. 89.
- Pharus guianensis albo-striata*.
- Pittosporum crassifolium*, September 9, p. 205.
- Polystichum ang. plumosissimum*, June 3, Supplement.
- Primula Her Majesty*, April 1, p. 203.
- Primula Lady Emily Dyke*, March 25, p. 181.
- Primula Swanley Giant Improved*, April 1, p. 205.
- Raspberry Golden Queen* (Veitch), July 22, p. 63.
- Rhododendron Kingianum*, October 21, p. 306.
- Strawberry Mentmore* (Laxton), July 29, p. 93.
- Taxonia militaris* ×, December 30, p. 487.
- Thamnochortus insignis*, April 22, p. 251.
- Thamnochortus spicigerus*, April 22, p. 249.
- Veronica Chathamica*, November 11, p. 353.
- Veronica Cookiana*, October 14, p. 297.

SEASIDE PLANTING OF TREES AND SHRUBS.

(Continued from p. 433, vol. xxi.)

Of deciduous flowering shrubs preference should be given to those that come into leaf late, and of which the foliage is small and of some substance, so that it may be able to battle with the spring gales, while those with pinnate leaves are to be preferred to those with large entire foliage of little substance. For instance, the Bladder Senna (*Colutea*) makes nice neat shrubs, and flowers most freely, generally producing its bladder-like seed vessels in profusion, while the masses of orange-yellow flowers that precede these are by no means ineffective. Other Papilionaceae are *Coronilla emerus*, and its greenhouse relative *Coronilla glauca*, which lives

through the winter on the south coast in most seasons, and gives abundance of its bright yellow blossoms, the first being quite hardy everywhere; and while we are with this genus it may be quite as well to note some of the Indigo shrubs which have proved hardy, as *Indigofera Dsoua*, and a variety from the north-west Himalayas, called *Gerardiana*, both are covered with drooping racemes

the ripened wood all along the fine shoots, abundance of bright, rose-coloured flowers, succeeded later by its small, glossy foliage, but very rarely setting or maturing any fruits.

Daphnes.—Another early-flowering shrub which gives its flowers before its foliage is the common Mezereon (*Daphne Mezereon*); its inflorescence is disposed all along its upright, somewhat stiff

borders, or on the rockery, but must have peat and moisture to do satisfactorily.

Myrica and Clethras.—If you have peat, both Candleberry Myrtles (*Myrica*) *Gale* and *M. cerifera* will thrive, but are not very ornamental, merely giving variety to the border; while their leaves, when swept by the wind, give off a scent of Myrtle. The dwarf-growing, white-flowered *Clethras*, do well by the sea, especially the Alder-leaved kind (*C. alnifolia*); and in the favoured climate of our Devon and Cornish coast, the finest of the genus, the *Clethra arborea* from Madeira would doubtless prove hardy, and make a handsome evergreen shrub.

Euonymus.—There are some subjects valuable for their ornamental fruits. One of these is the most attractive, but singularly neglected Broad-leaved Spindle-tree (*Euonymus latifolius*), for it has much to recommend it to planters; but, as London remarks, it must not be planted among a crowd of other shrubs, where it is apt to be drawn up and spoiled, but put in an open position, when it develops into a dome-shaped specimen, and will be well clothed with its handsome, broad glossy leaves, and flowers freely from June to July, and in the autumn is covered with its bunches of large red fruits, which hang down, and when ripe their capsules burst, and display their bright orange seeds, which are protruded from the valves of the capsule, remain in evidence a long time. The leaves turn a deep purplish-red, and are very attractive, and when they fall the shining red-green wood is still very handsome, and this is enhanced when the purple-brown buds become conspicuous. Our native Spindle-tree (*E. europæus*) also succeeds by the sea, but is not so good as the Austrian *E. latifolius*.

The Mock Orange (*Philadelphus*) may be used, the old variety, *P. coronarius*, doing best, though I have had the fine *P. speciosissimus* make large bushes, and flower most abundantly.

The Flowering Currants (*Ribes sanguineum* and *R. aurum*) though they at times, when in young leaf, get singed with the salt-laden gales, soon recover themselves, and in favourable seasons flower freely. The first will also produce fruit.

The Lilacs, both the common red and white, with the distinct *Syringa Ernodi*, from the Himalayas, are almost always satisfactory, but should be planted in only small specimens, when they will have a chance to become acclimatised. Though their foliage is large, there must be something in its form or structure that enables it to withstand rough winds.

Of *Deutzias*, the hardiest are the Japanese *D. crenata*, either the single or double-flowering variety, but those that come from India, even so far north as Nepal, are not reliable.

Rhus.—Good use may be made of the Sumachs (*Rhus*), the variety, called from its stiff, red-brown inflorescence, Stag's Horn (*R. typhina*), making large straggling shrubs, that are best headed back every few years. These flower freely on the points of the shoots, and afterwards the bold pinnate foliage turns a brilliant scarlet, and remains some time to delight the eye, in contrast to the surrounding dark green autumn foliage. Gathered when in full colour, and pressed in a book, the foliage retains its bright colour, and may be used for decoration; a thin coat of varnish, or even gum arabic, will stiffen the leaves, and help them to retain their colour. A variety of the N. American *Rhus glabra*, with foliage like a Fern, called *laciniata*, is worth growing for this alone; but the Cobweb-tree, *Rhus Cotinus*, or Venetian Sumach, forms a most attractive object, and when covered with its singular seaweed-like flower-heads, is very ornamental. It should be granted a warm sheltered spot, and it loves a moist peaty soil.

Staphylea.—The Bladder Nuts, *Staphylea*, are desirable, both from their distinct foliage and their sweet-scented white flowers. The pinnate-leaved kind is a native plant, but the N. American kinds are quite as hardy. The *S. colchica* flowers too early for our cold springs, but is excellent when grown in pots for forcing.

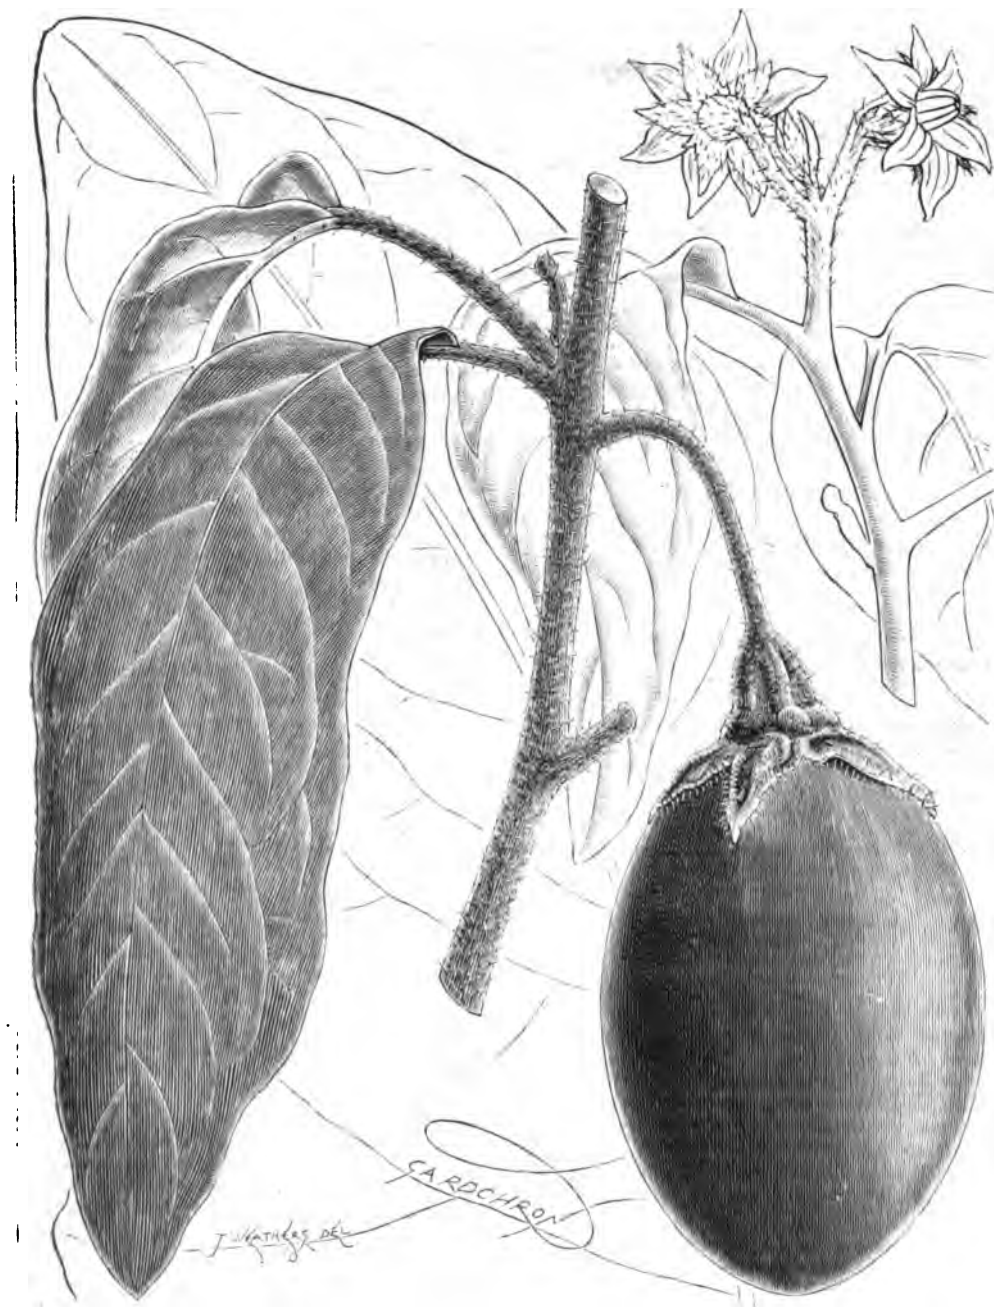

FIG. 5.—*SOLANUM WORSLEYI*. (SEE P. 18.)

of bright pink pea-shaped blossoms from May to September, and their finely pinnate foliage is elegant.

Almonds.—Perhaps the prettiest little flowering shrub one can use is the very early blossoming dwarf Almond (*Amygdalus nana*). This is a neat, low shrub, not exceeding 2 to 3 feet in height, which grows freely in ordinary dry soil, creeping along just under the surface, and throwing up abundance of suckers, clothed with small foliage, resembling some of the Willows, and producing on

branches. The flowers are fragrant of an evening, but not to be compared to the other *Daphnes* proper, not even the common Spurge Laurel (*D. laureola*), or its Levant variety, *D. pontica*, the greenish-yellow flowers of which are deliciously sweet of an evening. Both of these will thrive at the seaside, preferring a somewhat shady spot. The delightfully fragrant trailing *Daphne* (*D. Cneorum*), if the soil be moderately rich or peaty, will form pretty tufts, and give its sweet flowers twice in the year. It should be planted in the front of the

FRUIT-TREE ENEMIES.

UNFORTUNATELY, there are still a few insect-pests for which no certain cure has up to the present been found, but a great deal of disease which now exists could be checked, and in some cases in time entirely cured, if greater attention were paid to washing the trees in the winter or early spring, and sprinkling lime around the roots, as most of the pests lie dormant or in the chrysalis stage, in the ground or in the crevices of the bark.

I give below two excellent winter washes for trees, which if tried once, will I think always be used. The first should be used for Codlin-moth and American-blight, the second one for Lichen or other parasites:—1. Boil 3 lb. soft-soap in half-a-gallon of water for one hour, stirring frequently; then take from the fire, and pour into it $1\frac{1}{2}$ pint of petroleum; stir the mixture thoroughly until it becomes milky-looking, then add 24 gals. of water (rain-water preferred), stir again, and the wash is ready for use. It can be applied with an ordinary syringe while fairly warm.

2. Get a wooden pail or tub, and dissolve 1 lb. caustic soda in a little hot water, pouring the water on gently; also dissolve 1 lb. pearlash, mix them together, and dilute with 10 gals. of water. This should be applied with a brush, and worked well in to the crevices of the bark.

The following show the most generally known enemies of our fruit-gardens, and the methods used for successfully combating with these pests:—

CODLIN-MOTH.

The larvae of this most destructive of all insect-pests are found in the curled-up leaves of Apple-trees, generally in May. All the affected leaves should be, if possible, picked off and burnt. Later on in the season, the small and deformed fruits which drop off (not windfalls) should be treated in the same manner, or given to the pigs; well spraying the trees with the paraffin-wash mentioned in the last paragraph of this article.

BLACK CURRANT MITE OR "BIG BUD."

There does not seem to be a cure, so far, for this destructive pest, which ruins whole plantations. Some growers pull up and burn all the affected bushes, and dig in a quantity of gas lime into the soil. Others, again, prune back very hard half of their bushes one year, and the remainder the next. This means a great loss as regards fruit. I have heard that where fowls are allowed the run of the orchards or fruit plantations the mite is scarcely ever seen, and the slight damage they do to the fruit-buds is more than repaid by a crop free from disease. It is well to plant Black Currants in rows, with other bushes between, to prevent the spread of the disease.

AMERICAN BLIGHT.

A woolly-looking substance, investing a cocoon, and principally infecting Apple-trees. The following recipe of a well-known fruit-grower is an excellent one:—Arsenite of soda, 1 oz.; soluble petroleum, 2 lbs. (if this latter is not obtainable, boil $1\frac{1}{2}$ lb. of soft soap in 1 gallon of water (rain-water), and when melted, take from the fire and add $\frac{1}{2}$ pint of paraffin-oil, mixing thoroughly), and 12 gallons of rain-water. Dissolve each separately, the petroleum being dissolved in hot water, and stir them well together in an old wooden tub. Well syringe the trees with this mixture, and wherever possible, brush the boughs with a small brush dipped in the solution.

GOOSEBERRY CLUSTER-CUP FUNGUS.

This parasite affects both fruit and leaves, which, when attacked, show yellowish spots, gradually turning to orange-red. This disease greatly enfeebles the trees, and, unfortunately, there does not appear to be a radical cure. The best way is to cut off and burn all the affected boughs, and spray the bushes with sulphide of potassium or liver-of-sulphur, using $\frac{1}{2}$ oz. to 1 gallon of rain-water.

GOOSEBERRY CATERPILLAR.

The saw-fly lays its eggs on the under side of the leaf, and having done so falls to the ground, where

it remains in the pupa state till the following autumn. Pick off the affected leaves and burn them, then sprinkle Hellebore-powder on the bushes after a shower, and in a few days well syringe them with clean water. In the autumn take away the top soil around the affected bushes and spread lime and soot underneath, adding fresh soil. Then towards the end of March dig in more lime.

CANKER.

The signs of attack are shrivelling and crinkling of the bark, which at last bursts, and a large gaping wound is formed. This disease is generally caused by poorness of the soil, and by a fungus which enters the cracks of the bark; the best remedy is to remove some of the earth and give the tree a good dressing of manure. The wound should also be dressed, rubbing it with a chisel till the healthy wood appears, and then brush on Stockholm tar.

MILDEW.

The following solution is excellent for syringing or spraying trees with. In dry weather use liver-of-sulphur, 1 oz. to 10 gallons of water; in wet weather, 1 oz. to 6 gallons.

GUMMING.

If this occurs to a large extent the tree will slowly die. The best method to stop gumming is to scrape all the gum away and well wash the place where it formed, and stop it with a mixture of tar, clay, and horse-dung.

LICHEN OR "MOSS."

Wash the trees thoroughly with a strong solution of lime-water, and later scrape off the lichen, taking care not to injure the bark.

ANTS.

Pour boiling water into their holes; or paraffin is equally good.

APHIS, OR GREEN-FLY.

Well syringe and spray the affected trees with a paraffin wash, made as follows: Boil 1 lb soft-soap for one hour in a quart of water, remove from the fire and add half-a-pint of paraffin-oil, stir well and dilute with 10 gallons of water. E. H. Potter, Bedford Road, South Woodford, Essex.

THE ROSARY.

ROSES OF RECENT ORIGIN.

SINCE the introduction of Turner's Crimson Rambler in 1893, no climbing variety of equal value for garden decoration has appeared. We have indeed had those miniature beauties—Aglais, Thalys, and Euphrasyne; but I do not think they have made much impression upon the minds of rosarians. In any case they have not created for themselves a universal popularity, such as that which was at once achieved by the brilliant climber (which, nevertheless, was very fortunate in its English introducers) to which I have referred. Nor do I care much for Alister Stella Gray. Its flowers are almost too small to be effective; they are pretty when in bud, or even half-expanded, but they are not so attractive when fully blown. It is said to be a variation from William Allen Richardson; if so, I can only say that the parent is infinitely superior to its offspring. Both, however, are lacking in substance and compactness of petal, a serious limitation. Then we have a white Maréchal Niel, which, as might have been anticipated, is not pure white. It has not, consequently, met with what could justly be termed an enthusiastic reception. Any Rose possessing the regrettably pendulous habit, tenderness of nature, and susceptibility to atmospheric influences (especially heavy rain) as Maréchal Niel, is not constitutionally adapted for garden cultivation; it should be restricted to the regions of glass. Climbing Perle des Jardins is better adapted for open-air culture; but while, often richly effective, it has a tendency to

open imperfectly; there seems to be some error in the arrangement of its petals, which Nature is utterly unable to rectify. I have a large plant of this beautiful climber on the end wall of this manse, "locking," as Tennyson says of his dark Cedar, in *Maud*, "to the south, and fed with delicate air" (though not yet "haunted by a starry head"); but I find that though adequately protected from frost during the winter, and productive of exquisite foliage during the summer, the new shoots being always of a tender chocolate colour, it is by no means very prolific of its flowers. The original non-climbing Perle des Jardins in the open garden is, *mirabile dictu*! much more productive, though growing in a somewhat shady situation. A derivative from this Rose, entitled the White Perle, is a favourite with me; the delicate carmine-tinting on the edges of the white petals being very picturesque. Climbing Mrs. W. J. Grant, newly introduced into cultivation by Mr. William Paul, of Waltham Cross, has had a gratifying reception, and promises to be a very valuable "introduction." Several of Mr. Paul's Roses of comparatively recent origin have already achieved an enviable renown, especially such fine varieties as Enchantress, creamy-white in colour, and bearing a profusion of its graceful flowers, a precious hybrid between the Teas and the Chinas, and the most perpetual of all Roses, flowering very freely in winter under glass; Empress Alexandra of Russia, whose very remarkable colour has of late created a kind of controversy with regard to its value among Rose cultivators; Aurora, a charmingly-coloured pink Hybrid Tea; and Tennyson, which is described as deriving its characteristics from Mr. Paul's White Lady, still one of the grandest Roses of its special class.

Another hybrid Tea Rose of the rarest beauty and of commanding dimensions, besides being fragrant and very floriferous, is Bessie Brown, raised and introduced by those eminent Irish rosarians the Dicksons, of Newtownards, whose Meta, Beryl, Ulster, and Ardover (the last mentioned variety being a brilliant crimson, with a climbing tendency), are also highly interesting recent introductions. Purity, a beautiful white hybrid Bourbon, for which we are indebted to Messrs. Cooling & Sons, has won the Gold Medal at the National Rose Society, the highest honour that Association can bestow. Another new Rose that has been equally successful in this special direction, and promises to be of permanent value, is Mrs. James Cocker, raised by the well-known Aberdeen rosarians, whose attributes (I mean those of the Rose) have been derived from Mabel Morrison, a white Baroness Rothschild, and Mr. John Laing. One of the loveliest varieties of recent origination is expressively entitled Sunrise, by reason of its extremely bright and luminous hue. It was raised by the Messrs. Piper, at their Uckfield Nurseries, in Sussex, and I had the gratification of seeing it nearly two years before the date of its introduction. Paul's Royal Scarlet I have recently acquired, and anticipate that it will prove a great acquisition.

Among recently-introduced Continental varieties, two of the most promising are Comtesse Vitali and Grande Duchesse Anastasia (Nabonnand, 1898); while the richly-coloured Roses raised at Lyons, and dedicated by the great French rosarian of that region to the memories of J. B. and Catherine Guillot, have already achieved a considerable reputation. David R. Williamson.

FLORISTS' FLOWERS.

A PLEA FOR THE FANCY PELARGONIUM.

WHO actually originated the fancy Pelargonium we shall probably never know with certainty, but there is reason to believe the remote parents were the species *P. angulosum* and *P. grandiflorum*. About the year 1840 the varieties were very few, and they chiefly of continental origin, such as Acidis,

Ibrahim Pacha, Jehu, &c., and a variety named Queen Victoria, raised by a Mr. Sheppard, of Winchester, which, it is believed, appeared about the time the Queen came to the throne. At that time the Pansy and the Dahlia dominated in floricultural circles; the large-flowering Pelargonium was undergoing transformation from a starry, thin

possess, though in the later productions of the late Mr. C. Turner this was not so apparent. But few new varieties are now produced, because, beautiful as the fancy Pelargoniums are from a decorative point of view, they are not grown so much as they deserve to be. It is to be hoped there will always be some one interested in this delightful class of

good shape, because they naturally take on a compact form. Then as soon as the plants break into growth at the stopped points, they should be shifted into their blooming-pots, so as to have the pots well filled with roots by the time the plants flower. A rich soil is indispensable to the fancy Pelargonium, and it may consist of two parts of a

FIG. 6.—TAGETES LEMMONI, SP. N.: COLOUR OF FLOWERS YELLOW. (SEE P. 18.)

petalled, type to something more rounded in outline, and of greater substance, and the fancy type undergoing similar change in the hands of Ambrose, Gaines, and others. It was noticed then, as it may be noticed in the present day, that the fancy type is of more delicate constitution than the larger-flowered type, of closer and softer wood, more floriferous, and there could be noticed that there exist shades of colour which the other does not

Pelargoniums who will cultivate and preserve it from being wholly lost.

The fancy Pelargonium thrives best in a little warmth during the winter season, needing more than the large-flowered show types. Anyone having a warm greenhouse can at this time of the year obtain plants in 4-inch pots, and it is well at this season of the year to pinch back the leading shoots so as to induce the plants to assume a

good, turfy loam, one part of leaf-mould, and one part of well decomposed cow-dung, with a free admixture of silver-sand. The pots need to be well-drained, as anything in the way of a soddened soil must be avoided, or the plants rapidly go back. From this point to the time the plants flower, they should be kept as near the glass as possible, and that is why they are generally placed at the top of the plant-stage; they should be

lightly syringed in sunny weather, never allowing the soil in the pots to become dry, or the foliage to flag. Fumigation is necessary should the plants become infested with green-fly. Overpotting must be avoided as a mistake that may account for many failures. The root accommodation needs to be more restricted than in the case of the large-flowered type.

The treatment after blooming may be set forth in a few words. By the end of July or the beginning of August, the plants should be turned out of the pots, the soil shaken from their roots, and the latter pruned at their points previous to repotting, selecting pots just large enough to take the roots; then replaced in the greenhouse, shaded from the sun at midday, and kept a little close for a few days. Frequent syringings overhead should be given.

A display of bloom can be had in autumn and the early months of winter by striking cuttings in May or early in June; a little warmth is necessary for these late ones, to cause them to expand their blossoms freely. A good compost for such plants is equal parts of good turfy loam, peat, well-decomposed cow-manure, and leaf-mould, with a good portion of silver-sand. The pots, at the last shift, should be made nearly half full of drainage.

The following varieties of fancy Pelargoniums are obtainable? *Delicatum* and *Roi des Fantaisies*, two varieties which have been in cultivation nearly or quite half a century; *Nelly Fordham*, *Princess Teck*, a charming light variety; *Bridesmaid*, Mrs. Alfred Wigan, and *Princess Helena*. R. D.

POPULAR WHITE CHRYSANTHEMUMS.

Looking over the records of the shows it is curious to notice what a high position many of the good white varieties occupy. First of all show Chrysanthemums is *Calvat's* fine variety, *Madame Carnot*. Others in order of merit are *Madame Gustave Henry*, Mrs. J. Lewis, *Pride of Exmouth*, *Madame L. Remy*, Mrs. H. Weeks, *Mutual Friend*, *Nellie Pockett*, *Simplicity*, *Madame Ph. Rivoire*, &c. C. H. P.

PROPAGATION OF CHRYSANTHEMUMS.

No time should be lost in getting in cuttings of varieties of all sections, whether the blooms are required for exhibition or for home use. With a few exceptions, the five members of the *Vivian Morel* family, all Japanese varieties, are the better for a long season of uninterrupted growth. In the case of incurved varieties, early propagation is the more necessary. Contemporary growers do not succeed with the Chinese type of Chrysanthemum as they might do, by growing the plants in a more natural manner. Incurved Chrysanthemums require a long season of steady, uninterrupted growth, so that progress is marked by gradual maturation of the wood-tissues. It is only under the latter conditions that perfect examples of this section can be obtained.

Liverpool cultivators twenty years since did not dream of taking their cuttings of the "Queen" family in February, they preferred to insert them in December. I have seen better blooms of this type growing against a south wall many years ago than I have seen blossoming in the best appointed greenhouse during the past two seasons.

The single-pot system of propagation is best. If stout cuttings are inserted in sandy soil under a handlight in a cool house they emit roots readily, and with careful attention which will prevent moisture condensing on the leaves and stems, the tiny plants in one month's time will be ready for a position close to the glass in a house where frost only is excluded. Directly the small pots are full of roots shift on the plants to larger ones, and do not wait for a fixed date. There must be no check to growth.

Watering at this season of the year should be done with extreme care. Loss of chlorophyll, or colouring matter, in the leaves, is due to a check to growth caused by inaction of the roots, owing to an excess of moisture. The best, and much the easiest, of cures for pale-coloured foliage in Chry-

anthemums, is to keep the soil in the pots on the dry side, until a change in the colour of the leaves takes place, even if the leaves are almost at the flagging stage.

Cuttings of decorative varieties should now be inserted, and to save space and time, two cuttings may be put in one pot. Both can be grown on together, or may be divided at potting time without much check. Do not forget a good batch of single-flowered varieties; they will be found most useful at next Christmas. It is surprising what a long time the blooms of this type will last on the plants if the house is kept cool and airy. E. Molyneux.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Morello Cherries bear on the wood made during the previous season, and fruiting-spurs are therefore unnecessary. A mistake, and that a common one, is to lay in far too much young wood during the summer, and these in consequence become much crowded. Trees in such a condition must be well thinned out, and care taken in future to see that this error is not repeated. The first thing to be done is to cut away all the weakest and awkwardly-placed shoots and retain only the best, both in regard to their strength and situation. The knifeman must see that enough are left to furnish each tree with a sufficiency of bearing wood, which, when laid, should not be nearer to each other than from 3 to 4 inches. In the case of young trees, as many shoots must be left as are requisite for furnishing and extending them; but cut back, or remove as may appear necessary, any that are unduly strong. Trees that have become very crowded, may, with advantage, be relieved of a few of the oldest and decrepit branches. Should this be impracticable such old branches may be shortened back to a point from which younger and healthy ones emanate.

Sweet Cherries require treatment different to that advised for the *Morello*, inasmuch as they fruit upon spurs. If the trees were given proper cultural treatment last summer, but little needs now to be done, beyond shortening spur-growths, and tipping or cutting back, according to the space to be covered, young shoots that are retained to extend the tree or to replace faulty branches. Choice *Cherries* are well worth the protection afforded by a wall, and for such positions trees trained in diagonal form are best. The "fan" method is sometimes employed. Young trees trained after the latter form must be given close attention, and sufficient shoots left on the ends of the main and subsidiary branches to extend the tree. Cut back any "foreright" shoots to form fruiting spurs. Young trees that are trained diagonally will need, in addition to the shoots at the extremities of the branches, one left also on the main stem for upward extension. This will now require to be shortened to a point from which two shoots may be trained out right and left to form another tier of branches, and one to extend the main stem. Cordon-trained trees bear remarkably well if kept summer pinched. Cut back upon such trees any extra long spurs. *Desert Cherries* are not a success on all soils, and in some instances make too strong a growth, and gum badly. Lime-rubble is a good corrective in such cases, and lifting and laying the roots out in compost in which the latter is freely mingled. Impoverished trees should be given a dressing of 3 lb. bone-meal, and 1 lb. each of muriate of potash and superphosphate of lime. Mix all together, and strew on the surface at the rate of 2 oz. per square yard. The *Kentish* or "Pie" *Cherry* succeeds well on north or east walls as fans, and needs similar treatment to that described above.

Plums.—Established trees require much the same kind of pruning as the *Cherry* and *Pear*. Old and barren trees, having spurs projecting some distance from the wall, should be dealt with in the same manner as directed for *Apricots*, and if the trees are healthy, a fair quantity of new compost placed over the roots, after removing the inert surface-soil, will prove of great assistance in effecting their renovation. Cordons need to be closely spurred, and thin them out if they have become crowded. Upon young cordons, cut back

last year's growths as far as appears needful, and to a sound bud. Cordons may be trained to reach the coping of any ordinary wall in three seasons. Some varieties of *Plums* do not succeed as cordons, two notable examples being *Victoria* and *Golden Drop*. The latter, trained fan-shape, does well here on west, east, and north aspects. Impoverishment is oftentimes the cause of wall *Plums* ceasing to bear satisfactorily, and nothing restores them more quickly than a 2-inch mulch of partly-decayed manure, applied after loosening the surface-soil. The chemical manures recommended for *Cherries* may be used when farmyard or stable-manure is unobtainable.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WHEAT, Bart., Clare Lawn, West Essex.

Propagation of Orchids.—Like the majority of *Monocotyledons*, *Orchids* can rarely be propagated from "cuttings," as the term is generally understood, but easily from offshoots, or adventitious growths. Propagation by seed as a means of preserving the species has been seldom attempted, the chief aim having been to raise seedlings of hybrid parentage. There are one or two other methods by which our stock of certain *Orchids* may be increased, such as by the division of the root-stock, or rhizome, pseudo-bulb, and leaf-stem. The first may be employed in nearly all cases where the plant has a progressive root-stock, to which are attached healthy living bulbs, with dormant "eyes" or buds. In this case the root-stock should be notched or entirely severed immediately in front of a promising bulb, far enough back from the leading growth to prevent injury resulting to the main plant. This operation should be performed now, when the plants are more or less at rest, so that the dormant bud may subsequently benefit from the early flow of sap, and commence to grow at the best season for ensuring mature development ultimately. Until the new growth has attained a condition suitable for the emission of roots, the plants must not be disturbed; then, however, they should be divided and potted-up, and treated as the plant from which they were obtained. This method applies more especially to *Cattleyas*, *Lælias*, *Epidendrums*, *Dendrobiums*, *Cœlogynas*, &c. *Cypripediums* may be divided when the plants are being repotted, and even if there be no roots on the severed portions, pot them up, afford them careful treatment, and in most cases success will follow. Every portion of the root-stock of valuable *Cypripediums* should be saved, as the chances are greatly in favour of its breaking into life again. These need not be immediately potted, but laid amongst the plants on a moist stage.

Division of Pseudo-bulbs.—The genus *Dendrobium*, and one or two others, are most easily propagated by this method. Most Indian and Burmese species of *Dendrobium* having stem-like pseudo-bulbs may be cut into lengths, and laid on any moist substance in a warm position, and they will produce growths from nodes that have not flowered. These, when they commence to emit roots may be put into small pots. Species of *Dendrobium* that do not root so readily should only be cut half-way through between every second joint, otherwise decay may set in and destroy the portions. Hybrids may be treated similarly to the species from which they were obtained. The *New Guinea*, *Australian*, the *D. thyrsiflorum*, and *D. nigro-hirsute* sections of *Dendrobium* can seldom, if ever, be propagated in this manner. Sometimes adventitious growths appear near the apex of the pseudo-bulbs, and these should be allowed to remain until roots appear, when they may be removed and potted. *Thunias* are easily propagated by cutting the old living pseudo-bulbs into short lengths, and inserting them in moist sand, when the new growths will eventually throw out roots. The apical portion of the deciduous *Calanthe pseudo-bulbs* may be treated in like manner. Various species of *Catasetum*, *Cynoches*, and *Mormodes*, may also be increased by this method, though in their case moisture at the base may act as a deterrent.

The Vanda Section of the *Orchid* family cannot be propagated by any regular method, their increase being more the result of chance than calculation. In certain cases, however, strong plants of *Vanda tricolor*, *V. insignis*, *V. suavis*, and a few others having long bare stems, may be notched in a favourable position, and the portion between the notch and the lower leaves encased with moss, and

kept moist to encourage the formation of roots. When these have reached some inches in length, separate the upper portion at the notch and pot it up, leaving the basal portion in the original pot, so that side-growths may occur, which in their turn may also be taken off.

The Genus Phalenopsis furnishes us with a peculiar form of propagation, viz., by young plants which develop on the flower-spikes. To encourage the production of these the spikes should be permitted to remain after the flowers are removed, and in numerous instances young plants will form, which may be taken off when roots have been emitted. *P. Stuartiana* sometimes produces plants from the roots, but so far as my observation has gone, is the only one that does so.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Peaches and Nectarines.—Where these have been kept moist, and well fed at the roots since the fall of the leaf, and given proper ventilation, there should now be no anxiety about bud-dropping. Steady forcing should result in strong and perfect blossoms. Avoid keeping the buds constantly saturated with moisture, as it tends to encourage too rapid wood-bud development. Freshly-started houses should be kept at a temperature of 45° to 50° with a rise of 10° from sun-heat. Give the borders a dressing of burnt ashes, and wash it well into the border. Houses containing trees in flower must be kept ventilated night and day, to keep the air in motion, as stagnation of atmosphere is fatal to successful fertilisation. Take advantage of bright days to get the pollen into the best condition, and go carefully over the whole of the flowers with a small soft-haired brush. This should be repeated daily until the petals begin to drop. A temperature of 50° to 55° will be suitable during the flowering stage. Any late houses not yet dressed with insecticides should be treated without delay, and all tying and training completed as soon as possible.

Figs.—The cultivation of Figs is steadily increasing; they can be forced in pots with ease and certainty. For very early forcing it is necessary to have bushes that were potted late in summer, and that have got well established in their pots or tubs, before winter. Such plants may be introduced into heat at any time during December, and successions should follow at the present time. The most favourable means for starting Figs is a mild hot-bed of leaves, with a slight admixture of short dung. This should be well blended and sweetened before introducing the Figs. Half-plunge the pots, and keep them in a steady temperature of about 65°. When once started, never allow the plants to suffer for want of water. The best varieties for forcing are Brown Turkey, White Marseilles, and Negro Largo; some of the newer kinds are earlier, and that is all that can be said in their favour. Where there are established houses, the earliest should now be advancing into fruit and growth, and a succession-house may be started. Where the conditions are favourable, a slight hot-bed placed over the roots is a great inducement in developing the young fruits in the earlier stages of growth. Ventilate freely on all favourable occasions, to keep the growths firm and steady. Disbud all useless and badly-placed growths as early as possible.

Propagation of Figs.—The present is the best time for preparing a new stock. Any shoots of last year's growth should be cut into lengths, retaining one eye on each, and these may be inserted singly in small pots, or several in larger ones, putting them just below the surface of the soil. Place them in a steady bottom-heat of 70° to 75°, taking care not to keep them too wet until growth commences.

Cucumbers.—The winter-fruited plants, if not over-cropped, will still yield many fruits. If a little more freedom in the growth is permitted, and a top-dressing of light fibrous loam and leaf-mould given, fresh root-action will be induced. A night temperature of 65° to 70° should be maintained, and advantage taken of every sunny day to change the air in the house. Seed of some approved variety should be sown at once in a bottom-heat of 70°, keeping the young plants well up to the light as soon as they appear. Fermenting materials may also be prepared for planting-time by mixing together half leaves and horse-dung.

Melons.—No time should now be lost in making an early sowing in a bottom-heat not exceeding 75°, as it is a mistake to develop germination too rapidly at this season. A stiff, sturdy-stemmed plant should be the aim. Sow singly in small pots in light fibrous loam, and keep the young plants close to the glass in a night temperature of 70°. A good selection of Hero of Lookinge and Crump's Blenheim Orange are good types for early work.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

Fuchsias.—Plants struck in the autumn should now be moved into 5-inch pots, using a compost of three parts good fibrous loam and one part decayed manure, with a good sprinkling of sand; pot firmly, and encourage sturdy growth by placing the plants near to the glass in a warm house. Such varieties as Lady Heytesbury do not require stopping; if well grown, and fed later with liquid-manure, they will form perfect pyramids of bloom in May and June. Stock plants may now be cut into shape and watered. Syringing twice a day will assist them to break uniformly; when the shoots are just beginning to burst into leaf, the plants should be shaken out and repotted.

Cape Pelargoniums will also require to be potted, using similar compost as for Fuchsias, but cooler treatment is necessary, and air at all times. Some stopping of shoots may be needful, and an occasional fumigation, to prevent aphids. So much indoor decoration is now required, that large, formally-trained plants are seldom grown; but well-grown, bushy Pelargoniums are always bright and effective. Early varieties should be moved to warm pits, 50° to 55° night temperature.

Primulas and Cinerarias advancing to bloom will be much improved in flower and colour of foliage if watered with weak guano and soot-water. The same stimulant will suit Freesias, which will require a neat stake for each bulb, so that the flower-spikes may be trained straightly.

Stove Plants.—Gardenias for winter-flowering are best grown in pots, and a fresh stock raised annually from cuttings. They should flower in 6-inch pots; if rooted early and stopped occasionally to ensure compact habit, young plants give larger flowers and better stems for cutting than old ones. They require a brisk heat—70° night temperature—to bring them into flower in January. As soon as the bud is formed, pinch out the shoots; if these are left to grow, the buds frequently become blind. For later flowering, plants put out in a bed will produce blooms in large quantities during April and May. A compost of equal parts of loam and peat, with a sprinkling of sand, suits the Gardenia well. Top-dress after the second year, and replant after the third. Codieums (Crotons), Cordylines (Dracenas), &c., that have been previously rooted, and are ready for potting, may be shifted on, and kept in a strong heat with atmospheric moisture. The earliest Tuberoses should now be started in 5-inch pots, using light sandy soil. Place the bulb about half its depth in the soil, and plunge in bottom-heat in the forcing-house; water once only, and no more will be required until the roots become active, and growth has commenced.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLPOED, Westonbirt, Tetbury, Gloucestershire.

Horseradish.—Evenly-shaped roots can only be produced by cultivation. Lift the roots now, and select the strongest for use. Tie them in bundles and cover them with soil or sand, or they may be laid in trenches under a north wall. The smaller roots from six to nine inches long will be required for planting. Well trench the soil, and pick out all small roots. Trench again and add some well-decomposed farmyard manure at the bottom. When the soil has become settled it may be firmly trodden down, and the selected small roots dibbled in deeply at about one foot apart.

Artichokes (Jerusalem).—To obtain tubers of good size it is essential that they be lifted annually and the largest selected for use. If these be stored in moist sand or pitted in the open to exclude the air, they will keep fresh for a long time. The tubers next in size may be retained for seed. If required to be grown in the same position the soil should be deeply trenched, cleaned, and manured, and after allowing the ground to settle, the tubers

should be dibbled in, in rows 2 feet wide, allowing a distance of 9 inches between each set, and inserting them about 5 inches in the soil. Sutton's White is a great improvement on the old purple variety, both in productiveness and flavour, the tubers being also well shaped, pure white in colour, and having fewer eyes.

Artichokes (Globe).—These are less hardy, and require protection during the winter months. If straw or litter has been placed round the crowns, an examination should be made to see whether rain has penetrated it, and if there are signs of decay it should be removed during dry weather, and some fresh straw placed in its stead.

Rhubarb.—This vegetable is always in demand at this season of the year. It is easily forced, and the largest sticks may be obtained if strong roots of from two to three years' growth are available. Rhubarb may be forced in the open ground, just as was advised last week in the case of Seakale. A good crop may be ensured, however, if it is cultivated in a Mushroom-house, or similar structure, where a fairly even temperature between 55° and 60° may be maintained. Crowns of the smaller and earlier-growing varieties, such as Champagne, Early Scarlet, Royal Albert, and Kelway's Queen, may now be lifted and placed in their forcing quarters, working some leaf-mould or other light soil between the roots. Occasional waterings with tepid water will be necessary.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ilchester, Abbotsbury Castle, Dorset.

Hardy Fern and Alpine Rock Garden.—Remove decayed foliage from the crowns of choice dwarf plants, and give them a top dressing of the best leaf-mould and sand. To prevent grubs and other troublesome pests, use finely-ground glass. Cork refuse is also suitable for such use in the rockery. Loosen the soil during mild weather with a small hand-fork.

Frost and Snow.—Every precaution should be taken to provide against frost and snow. Have mats in readiness, and plenty of bracken, which is still one of the best natural coverings we have. Wreaths of twisted bracken are invaluable for binding round tender plants and shrubs. A number of props should be ready for shaking snow from Coniferous trees, &c., and for leaving as supports during the night.

Bamboo Dell.—If the Bamboos have been planted on the sunny side of the dell, they will be partly screened from cold winds; but if the clumps have assumed good dimensions, stout stakes and cord will be needed to support them. Strong east winds or snow browns the foliage of these plants. Small sugar-tubs make the best protections for young plants and choice species by covering them completely over. The same treatment can be given many half-hardy plants during severe frost.

Rhododendrons, Camellias, and Azaleas.—In localities where these are growing outside, tiffany is useful to cover the early buds, which are very prominent this year; Rhododendrons Nobleanum, præcox, and ciliatum; Camellia japonica and Azalea indica are worth a little extra care. Azaleas, if nipped in the bud rarely open perfectly.

Bulb Garden.—Anemones and Ranunculus should be planted during genial weather. A sunny, well drained position suits them best, and they need a deep and good loamy soil, enriched with plenty of well-rotted cow-manure, and a little sand and soot. When the beds are ready, plant the bulbs rather closely together, and 2 to 3 inches deep. The rarer kinds of the bulbous section of Irises, viz., Bakeriana, Danfordi, Histris, Rosenbachiana, are fast approaching their flowering stage, and the most useful Iris stylosa is now in full blossom. The flower-spikes, as they appear, should be given neat stakes to support them during boisterous weather. A sharp look-out is necessary, for slugs are their worst enemy; they eat off the spikes as soon as they have appeared, unless great vigilance is exercised.

The Shrubberies.—Those intending to make new or add to or re-arrange ornamental shrubberies should lose no time in commencing the work. The weather being damp, and free from much frost, the taking up and relaying of turf in conjunction with digging may proceed apace.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JAN. 16.—Annual Meeting of the National Dahlia Society.
THURSDAY, JAN. 18.—Linnean Society, Meeting.

SALES.

MONDAY, JAN. 15.—Dutch Bulbs, Roses, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, JAN. 17.—Japanese Lilies, Tuberoses, Palm-seeds, Continental Plants, Lily of the Valley Crowns, &c., at Protheroe & Morris' Rooms. Fruit Tree, Roses, Pearl Tuberoses, Arancaria excelsa, at Stevens' Rooms.
THURSDAY, JAN. 18.—Roses and Lilliums from Japan, and Herbaceous Plants, at Stevens' Rooms.
FRIDAY, JAN. 19.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36°.

ACTUAL TEMPERATURES:—

LONDON.—January 10 (6 P.M.): Max. 47°; Min. 38°—
January 11: Light frost; dull.
PROVINCIA.—January 10 (6 P.M.): Max. 47°, S.W. Ireland; Min. 37°, N.E. Scotland.

At this season of the year many of the committees and officials having the management of flower-shows will be busy concocting their schedules and formulating the regulations for the shows to be held in the autumn or summer. They cannot be too particular. The greater part of the protests that are raised, and of the dissatisfaction that is occasionally felt, is due to the faulty or ambiguous wording of the schedules. It is, we take it, the duty of the judges to follow the text of the schedule as far as possible, even if it lands them in absurdities. Their duty is to follow the schedule, as a compositor follows "copy," but to call the attention of the committee to the difficulty immediately, in order that the matter may, if possible, be set right before a final decision is given. The responsible persons are the members of the committee, and they should not endeavour to fasten undue responsibility on the judges. The judges, paid or unpaid, are the servants of the committee, for the time being, and they must follow out the behests of the committee as set forth in the schedule. If they are to judge properly they should not be hindered in their work by having to discuss disputed points in the schedule.

It is a frequent practice to refer disputed cases to the editor of one or other of the horticultural papers. For ourselves, we find this practice objectionable, because in most cases we can have no first-hand knowledge of the details at issue; and next, we have quite enough to do with our legitimate business without losing time in arbitrating in matters beyond our limitations. We take, by way of illustration, three questions from a number that were submitted to us last season:—"Are Ferns foliage plants?—that is, can they be included in the same classes as what are known as 'foliage plants?'" Our answer was in the affirmative, because Ferns are grown mainly as "foliage plants," and the schedule said nothing to the contrary.

Another question was, "Can bulbous plants, such as *Lilium auratum*, be shown in collections

of herbaceous plants?"—a very difficult question to decide satisfactorily, because, although a bulb is truly a herbaceous plant, it is in catalogues generally included in a distinct group. This difficulty, at least, might readily be met by schedule-makers, who, when devising their classes, have only to specify herbaceous plants—bulbous plants excluded or included as they may prefer.

Here, too, is a difficult question to decide in a hot tent, and, indeed, not much easier in a cool room: "Is *Centaurea Cyanus* admissible in collections of wild plants?" The answer, we take it, is "No," for the plant in question is reckoned by most, if not all, botanists as a cornfield-weed. Most collectors and wild-flower gatherers, we imagine, would not be so particular, but would class it among wild flowers.

But such questions as these few as compared with those that arise from the exceedingly loose way in which the majority of us still speak and write in ordinary language of botanical sub-divisions. Orders, families, classes, sections, tribes, genera, species, varieties, kinds, are used indiscriminately, without thought, as if they were synonymous or interchangeable. Even at the fountain-head in the "Rules for Judging" we find "species" entirely omitted! and all "natural genera spoken of as kinds," and "all variations within a genus as varieties." Of course, if the Royal Horticultural Society arbitrarily lays down the rules to be followed we must conform till a fair opportunity occurs of inducing the society to alter so singular a pronouncement. In the same document compiled for the use of judges and schedule-makers we find Peaches, Nectarines, Apples, and Plums, called, "for exhibition purposes," distinct "kinds" of fruit, as everyone will admit, but surely Apples are so widely different that the distinction here is more than is implied by the word "kind."

Then we find Cabbages, Kales, Savoys, Brussels Sprouts called distinct "kinds" of vegetables, though it is, we suppose, certain that they are all descendants from the same stock. We have, however, to do with the actual, rather than the historical, and we should not have called attention to the matter were it not for the fact that after calling Cabbages, &c., "kinds," a few lines lower down they are spoken of as the "Cabbage tribe," and on p. 17 there is a note on the "Cabbage family"; while similar variations in Peaches, Roses, Peas, are called "varieties," so that "families," "kinds," "tribes," and "varieties" are all used to connote the same amount of difference. Obviously, this is not what the compilers of the rules for judging meant to do.

Other illustrations of the confusion that arises from ignoring the relative degrees or ranks among plants may be cited from the same publication. "Collection of twelve dishes of ripe fruit, not less [fewer] than six kinds, nor more than two varieties of a kind"; p. 1. Here, the word "species" would be preferable to kind. The six species might be Grapes, Peaches, Melons, Strawberries, Figs, Pines, or otherwise. "Collection of six distinct kinds of vegetables; only one of the Cabbage tribe may be included." Here we should prefer "varieties" to "kinds"; while the word "tribe" should give place to "species," because tribe has a distinct botanical signification, below an order and above a genus, and to use it, as is done in this code, is as if we were to call a corporal a major-general, or an islet a continent.

The only way out of the entanglement is to

follow the plan adopted by all or, at least, the great majority of botanists, a plan laid down by LINNÆUS, modified by the elder DE CANDOLLE, and adopted at the Paris Congress of Botanists. This is based upon the following considerations, well known by botanists, but which are not sufficiently heeded by gardeners.

All recognised "species" have a name. That name is two-fold, one half of it being generic, the other specific: thus *Brassica oleracea* is the name for the Cabbage species.

If the distinctions in a particular plant be not sufficiently great, in the judgment of botanists, to warrant a specific name being given, the plant is not registered; or, if registered, it is only so as a "variety," a "sub-variety" of a species, and so on.

Few persons should be better judges of what constitutes a species than the gardeners, at any rate, where cultivated plants are concerned.

Leaving scientific considerations on one side, and dealing with the matter solely from the point of view of practice and convenience, it may be said that any plant or group of plants deemed sufficiently distinct to have a separate specific name is a "species," as above described. If the distinctions are not constant or less prominent, a "varietal" name may be given.

It may be said that one man will be of one opinion, one of another, and that therefore there will be no fixity about these names. That is quite true; there is no absolute fixity about the plants or about the species, and therefore an arbitrary limitation has to be drawn by the botanist.

A "species," though made up of an aggregate of individual plants, may be taken as the unit. It consists of all those individual plants which are so much alike that they are known, or may reasonably be assumed to have descended from the same parentage, and which will transmit their characteristics more or less completely to their descendants. Thus, all the garden forms of Cabbage belong to the genus *Brassica* and to the species *oleracea*. Other specific units go to make up the Radish genus (*Raphanus*), or the Seakale genus (*Crambe*), and so on. All these genera we have mentioned are very much alike in their flowers and fruits and seed, and are probably descendants of the same stock, so they are included in the same Order *Cruciferae*.

The specific units may thus be aggregated: into, first, genera, and then into numerous groups of gradually increasing degrees of importance.

On the contrary, the specific unit may be divided into fractions. Varieties are, as it were, fractions of a species. Or it is permissible to liken the "species" to the unit placed to the left of the decimal point—1°, whilst the varieties would be placed to the right of it, according to their relative degree of importance—1°9876.

All this is very elementary, and as interesting as a page from a text-book, but it is absolutely essential that the principle be firmly grasped and well understood before attempting to apply it in practice.

In paragraph 3 of the code, we have the difficulty raised about "kinds" and "varieties." This might be got over by abolishing the word "kind" altogether in official documents. "Variety" in botany has a distinct signification and a distinct place in the hierarchy as a sub-division of a species; "kind" has none. "Peaches and Nectarines" are, therefore, varieties of a species. Apples are varieties of another species and of another genus. Plums

are varieties belonging to still another species and still another genus.

Peas are varieties of one species; Cabbages, Kales, Savoy, Brussels Sprouts, are all variations from one species; though spoken of in the code sometimes as a "tribe," sometimes as a "family!" as if we were to speak of a company of soldiers as a brigade or even an army-corps. Carrots are all varieties of *Daucus Carota*; Broad Beans of *Faba vulgaris*; Kidney Beans belong to an entirely different genus, and are varieties of a separate species. Roses, Chrysanthemums, and Phloxes, are respectively varieties of various species. In these cases there is no need in the schedules for the word "kind," as the term variety covers them all.

to their relative rank which we have endeavoured to mark by differences of type. The "species" is, here, the pivot upon which everything depends: to the left are the higher, more comprehensive groups, to the right are the subdivisions or fractions of a species. To further illustrate the matter, we may add the following example:—Order, Vitaceæ; genus, *Vitis*; species, *vinifera*; varieties, Black Hamburg, Muscat of Alexandria, and so on; or—

Order, Cruciferae; genus, *Brassica*; species, *oleracea*; varieties, Savoy, Cauliflowers, Kales, &c.

Further sub-division into sub-varieties, variations, &c., might readily be made if requisite.

We feel an apology is due for entering on

nificant Oak, illustrated by a supplement to the *Gardeners' Chronicle*, March 18, 1899. This Oak grows on the estate of Brynderwen, near Usk, Monmouthshire, and the measurements of the tree are—Circumference of bole at ground-level, 51 feet; trunk at 4 feet from the ground, 22 feet; at gnarled parting of boughs from the trunk 6 feet 6 inches from the ground, 35 feet. General GILLESPIE was very proud of this fine tree. The estate of Brynderwen ("Oak-on-the-Hill") is still the residence of deceased's widow.

MRS. W. PAUL.—The many friends of Mr. WILLIAM PAUL, of Waltham Cross, will deeply sympathise with him on the death of his wife, who died at Waltham Cross on the 7th inst., in the sixty-seventh year of her age.

FIG. 7.—VIEW IN THE GARDEN OF EILENROC, NEAR ANTIBES, THE PROPERTY OF MR. WYLLIE. (SEE P. 27.)

In other instances the limitations should be of a wider character, as in the class mentioned on p. 35, "twelve bunches of Hardy Flowers, distinct kinds, or distinct varieties." In such a case, if "variety" be used, it might, and we think, rightly, be taken to mean "distinct varieties of one species, so that a dozen Michaelmas Daisies might be shown, when the intention of the schedule-framer was probably to ask for bunches of different flowers.

DE CANDOLLE the younger admits of twenty degrees or ranks, which is more than enough for ordinary purposes. The following will probably suffice for the schedule-maker:—

ORDER. GENUS. SPECIES. VARIETY. Variation.

For exhibition purposes this is probably sufficient, always provided that they be not used promiscuously, but always with due regard

these banalities; but if the reader will open the first flower-show schedule he comes to, he will probably see that it is high time a protest was made about the laxity and carelessness with which they are worded.

MRS. MOORE.—We regret to have to record the death of Mrs. MOORE, the wife of the sub-editor of this journal, who died at Fulham, on the 3rd inst., in the sixty-second year of her age.

MR. HARRY VEITCH.—We understand that Mr. and Mrs. H. J. VEITCH are about to leave for a lengthened tour in Egypt and the Holy Land. Their numerous friends will cordially wish them a pleasant trip.

MAJOR-GENERAL GILLESPIE, whose death was announced recently, was the owner of the mag-

MR. H. V. MACHIN is spoken of in the *Rosarians' Year Book* as the largest amateur, and one of the most successful Rose-growers. He has about 40,000 plants, in addition to "garden Roses." He has won a first place 265 times in ten years, and twenty-four Medals for the best Rose, besides hundreds of other distinctions.

HORTICULTURAL EXHIBITIONS AT ANTWERP.—The Royal Horticultural and Agricultural Society of Antwerp has forwarded particulars of exhibitions to be held by them during the present year. Of these the earlier (the 170th exhibition arranged by the Society), will take place from July 28 to July 31, in the Palais des Fêtes of the Royal Zoological Society, and will be devoted to flowering and foliage plants, exotic Orchids, cut-flowers, and floral decorations. The 171st of the Society's exhibitions will be open, in the same locality, on November 10 to November 12, and will include

Chrysanthemums, flowering and foliage plants, floral decorations, and fruit. These exhibitions are under the presidency of Baron Ed. OSY; the secretary is M. ANATOLE DE COCK. Exhibitors must be members of the Society as regards almost all the sections, a few only of those at the November exhibition being open to outsiders. Programmes and particulars are procurable from the secretary, and would-be exhibitors must signify their intentions to him (addressed to 9, Longue Rue de l'Hôpital, Antwerp), six days before the opening of the exhibitions.

THE FRENCH HORTICULTURAL SOCIETY OF LONDON will hold its annual dinner on Saturday, the 13th inst., at the Imperial Restaurant, Strand. The French Minister will occupy the chair.

"BOTANICAL MAGAZINE."—The January number opens with a good figure of the extraordinary *Coryanthes maculata*, which flowered at Kew in May, 1899, tab. 7692. It is a native of Guiana.

Haylockia pusilla, tab. 7693, is a *Crocus*-like plant, but having six stamens and an inferior ovary; it is a true *Amaryllid*. It is a native of Uruguay.

Macleania insignis, tab. 7694, is a Mexican *Vacciniad* with stiff, scaly, robust, ovate, sessile leaves, and tufts of tubular orange-scarlet flowers about 1 inch in length. The limb of the corolla is shortly five-lobed, and the calyx is truncated and five-winged, about $\frac{1}{2}$ -inch long. Botanic Garden, Cambridge.

Dioscorea juncea, tab. 7695. — A *Verbenaceae* shrub of loose, branching habit, with glabrous, opposite, or verticillate branches, and small sessile, oblong, toothed leaves. The flowers are in close, many-flowered racemes at the end of the short shoots. The corolla-tube is about $\frac{1}{2}$ -inch long, curved, pale violet, with a spreading five-lobed limb. It is a native of Chile, and is hardy at Kew.

Rhododendron arboreum Kingianum, tab. 7696. — See *Gardeners' Chronicle*, 1899, ii., p. 306, f. 102.

"THE ROSARIANS' YEAR-BOOK" opens with a portrait and a note on the rosarian career of Mr. H. V. MACHIN. Rev. J. H. PEMBERTON discourses on new Roses; the Gold Medal Roses were Ulster, H. P.; Beattie Brown, H. T.; Mrs. Edward Mawley, T. (all from Messrs. DICKSON & SONS); Mrs. Cocker, H. P. (COCKER); Sunrise, T. (PIPER), figured in the *Gardeners' Chronicle*. Mr. GEORGE PAUL has some interesting reminiscences about planting and pruning garden Roses. Mr. MAWLEY's sketch on the weather of the past Rose-year is, as usual, a summary which will be useful to very many besides rosarians.

ROYAL HORTICULTURAL SOCIETY.—That the meeting on the 9th inst. should be small, and thinly attended, can be no matter for surprise. We cannot therefore wonder at the request sent up to the Council from the Floral and the Fruit Committees, that at this season of the year the meetings should be monthly instead of fortnightly. If Orchids, or some exceptionally interesting plant happens to bloom, it might still be exhibited on the alternate Tuesdays in the Lindley Library, and the members of the Committees would be spared the trouble and expense of coming to adjudicate upon nothing.

THE CHARTER OF THE ROYAL HORTICULTURAL SOCIETY.—We are informed that the new Charter has received the Queen's assent, and has been signed by Her Majesty.

ASPARAGUS.—A writer in the *Revue Horticole*, commenting on the vast quantities of Asparagus imported from France and Spain, goes on to tell his readers that the cultivation of Asparagus, forced or otherwise, is à peu près nulle in England. We should say, on the contrary, that there is scarcely a kitchen-garden in the country without its Asparagus-bed, and we think if the writer could see the enormous quantities that arrive in the

market during the season from Colchester, Evesham, Sandwich, and other centres, he would no longer say that there was scarcely any Asparagus grown in this country! The writer again tells us that the Argenteuil Asparagus, with thick white "sticks," with a short rose-coloured or violet tip, is not sold in London. It is sold in London, but at exorbitant prices. It is not in popular use, because our people so greatly prefer the English green Asparagus. It is a matter of taste, of course, but we think the preference of our countrymen amply justified. True, the Argenteuil Asparagus requires a different method of cooking.

STOCK-TAKING: DECEMBER.—The Exchequer accounts for the nine months just closed show how great has been the recovery in trade during that period; the figures for the past twelve months relating to the trade of the country are also most encouraging, though it cannot be denied that war has a way of disarranging both imports and exports. The Board of Trade Returns for the month of December and for the year thus closed, may be very briefly reviewed. The imports for the month foot up at £40,738,876, against £45,364,786 for the same term in 1898, showing a loss of £4,625,890, which may be placed to the account of reduced values and quantities in food and drink imported, and to a large fall in the imports of materials for the manufacture of textile fabrics. In the food supplies a large reduction will be found in fruits, &c. The following extracts from the Summary Table of Imports show some of the decreases:—

IMPORTS.	1898.	1899.	Difference.
	£	£	£
Total value ...	45,364,786	40,738,876	-4,625,890
(A.) Articles of food and drink—duty free ...	16,008,989	14,806,872	-1,097,117
(B.) Articles of food & drink—dutiable	2,364,590	2,261,477	-103,113
Raw materials for textile manufactures ...	9,598,105	6,645,632	-2,947,473
Raw materials for sundry industries and manufactures	4,090,759	4,854,849	+264,090
(A.) Miscellaneous articles ...	1,575,364	1,446,872	-128,492
(B.) Parcel Post ...	77,885	75,399	-2,486

It is worth mentioning here that the Commercial Intelligence Department is now at the service of anyone engaged in business. It has an office in Parliament Street, Westminster. This promises to be of vast importance to both traders and manufacturers, and has long been a necessity.

As to the supply of fruits, roots, and vegetables, we take from the mass of figures those herewith appended:—

IMPORTS.	1898.	1899.	Difference.
Fruits, raw:—			
Almonds ... cwt.	16,876	12,639	-4,237
Apples ... bush.	642,278	560,414	-81,864
Grapes ... "	13,303	7,916	-5,389
Lemons ... "	223,481	170,960	-52,515
Oranges ... "	2,231,712	1,443,814	-787,898
Pears ... "	18,931	13,673	-5,258
Plums ... "	338	...	+338
Unenumerated ... "	80,520	95,161	+14,641
Roots and Vegetables:—			
Onions ... bush.	494,379	535,718	+41,339
Potatoes ... cwt.	75,354	221,670	+146,316
Vegetables, raw, unenumerated ... value	£124,601	£95,210	-£29,391

Vegetables, it will be seen, supply the "plus" quantities. The value of the imports for the year is placed at £485,075,514, as against £470,378,583, or a difference in favour of 1899 amounting to £14,696,931. Possibly, had trade begun its upward

movement earlier in the year, the figures would have been much nearer £500,000,000. The

EXPORTS

for the month of December are placed at £22,038,489, as against £20,978,408 in December of 1898—an increase of £1,060,081. The subjects of increase are in raw material, metals and manufactures therefrom, and new ships. The year's figures are £264,660,647, against £233,359,240 in 1898, or a gain of £31,301,407. With these cheering figures we leave the double entry of stock-taking.

CYTISUS SCHIPKAENSIS is the name of a dwarf shrub, with trifoliate leaves, and heads of white flowers. It is by some considered to be a variety of *C. leucanthus*. A figure is given in the current number of the *Revue Horticole*.

"THE GARDEN."—The first number of the new series, edited by Miss JEKYLL and Mr. COOK, is before us. It retains its old form, and even more of its elegance. The paper is too highly glazed to be agreeable, but it certainly gives light and life to the illustrations, and brings up the type with great distinctness. The preface recalls the work which Mr. ROBINSON has done in scotching the bedding-out craze, and promises to "strengthen all *The Garden's* good traditions." The Dean of ROCHESTER gives the new series a sympathetic send-off, as he did in the first number of the former series. For the rest, the articles are of the usual type, which is not to be wondered at, seeing that the writers are now for the most part the same in all the papers. The old-fashioned loyalty is not understood, and is a thing of the past. The illustrations are excellent, that representing the Water-buttercup in a meadow-stream, though having little reference to horticulture, is very beautiful as a picture. Mr. MOON's representation of Violets show the vast difference between the point of view of the artist and of the gardener and botanist. Fit tribute is paid to the work of Mr. G. F. WILSON, but the writer has omitted to say that Mr. WILSON fought hard for the guinea subscription to the Royal Horticultural Society, which has since been adopted with such conspicuous success. Coloured plates will be given, not weekly, but when there is occasion for them. We may be allowed to offer our congratulations on the appearance of the new series under such good auspices.

A CRIMSON MADAME CARNOT CHRYSANTHEMUM!—It has not seemed probable that this large and popular Chrysanthemum would give a sport having crimson flowers. But we are informed that the stock has been purchased by Messrs. WELLS & Co., of Earlswood, Surrey, of a variety that is described as such. There seems little doubt but the flowers are crimson, and the foliage is very nearly alike to that of Madame Carnot, but whether it will prove to be an actual sport remains to be seen. If this is so, we should be interested to hear if the original white-flowered variety, or one of the yellow forms, sported crimson.

"THE HORTICULTURAL DIRECTORY AND YEAR BOOK FOR 1900" is a most useful publication. Besides the value it has as an address-book for horticulturists generally, the forty-first edition contains a large number of "useful garden receipts," and much information a gardener is likely to need. It is published at 1s., at *The Journal of Horticulture* Office, 12, Mitre Court Chambers, Fleet Street, London.

"FRUIT FARMING FOR PROFIT."—By GEORGE BUNYARD (Maidstone: W. S. VIVISH, 28, King Street). This is the fourth edition, revised to 1900, of a "practical treatise embracing chapters on all the most profitable fruits, with detailed instructions for successful culture on the Kent system." There is certainly no one better qualified by practical experience to write such a book as this than Mr. BUNYARD, and the proof of this is the success achieved by the previous editions of it. The volume before us will no doubt meet with an

equal welcome from all interested in fruit-farming and in fruit-growing on a smaller scale. The author begins with such primary matters as soil, shelter, planting, and pruning; going on to the consideration of each kind of fruit, the merits and demerits of old and new varieties, &c.; and concludes with chapters on packing, gathering, and storing, prices and profits, labelling and insects, diseases and enemies.

THE STORY OF ATTALEA PRINCEPS.—In *Unwin's Chap-book for 1899—1900* (T. FISHER UNWIN, Paternoster Square), is an allegory called "Attalea princeps," written by GARSHINE, and translated by F. L. VOYNICH. The story tells of a noble Palm, impatient of its glassy prison in the conservatory of a botanical garden, and growing in its pride and dissatisfaction to such a height, that it at last succeeded in breaking the glass, and towering up into the cold, foggy air of autumn. The result may be imagined. The order went forth that the tree should be cut down. "We

bution in the following spring; (2) Varieties which are exhibited with a distinctive name, together with the name of the introducer or raiser, the names of such varieties to be retained as their future distinctive appellation."

TOO LATE FOR ALMANAC!—The annual exhibition for 1900 of the Royal Horticultural Society of Aberdeen will be held in the Duthie Park on August 16, 17, and 18.

CYCLOPEDIA OF AMERICAN HORTICULTURE.—This monumental work, edited by Professor BAILEY, said to be the most comprehensive review of the vegetable world, is now in the press. Though distinctly an American work, not only plants indigenous to the North American continent are mentioned, but also all the species known to be in the horticultural trade in North America, of whatever origin. It is really a survey of the cultivated plants of the world. Prof. BAILEY takes the view that a subject of commercial importance, one

feature of the *Cyclopædia of American Horticulture* is its wealth of bibliographic reference. The world's horticultural literature has been thoroughly searched, and most carefully indexed, so that the student will find citations to every available article or illustration upon any subject consulted. The *Cyclopædia of American Horticulture* is to be completed in four handsome quarto volumes, embracing about two thousand pages, with more than that number of original illustrations. It is carefully printed upon specially made paper of a permanent character. The first volume will be ready in January, and the work will be completed during the year. The book is sold only by subscription, and orders will be accepted for the full set only. Terms and further information may be had of the publishers, the MACMILLAN COMPANY, No. 66, Fifth Avenue, New York.

THE INVISIBLE ENEMY.—Further illustration of the invisibility of the enemy to which a war correspondent made reference in the letter published recently in one of the daily papers is furnished in a letter from an officer in Lord METHUEN's force, printed in the *Evening News*: "... And so your Chrysanthemums are out. I wish I could see them. You may think my taste strange, but I would rather see one of your prize Chrysanthemums than all the Boers in Africa. Perhaps you think it is easy to see a Boer, but it isn't. We have fought four tolerably big battles against them, but few of us have seen a single Boer. He is the invisible enemy. He lies in the grass, deep down in a trench, or behind a rock, and spits death at us all day long, but we never see who is killing our men."

SELBORNE WINTER LECTURES.—The Selborne Society has made a new departure by arranging a series of monthly lectures, which it is hoped the members will heartily support. The second lecture will take place at the Luncheon Society's Room at Burlington House, W., on Tuesday, January 16, at 8.30 P.M. The subject will be "Man's First Contact with Nature," by Professor G. S. BOULGER, F.L.S., F.G.S. The February lecture will, it is hoped, be the one promised some months ago by the Hon. J. SCOTT MONTAGU, M.P., on "South African Fauna and Flora;" and the March lecture one by Dr. LUBBOCK.

PUBLICATIONS RECEIVED.—*Queensland Agricultural Journal*, November, 1899.—*The Canadian Horticulturist*, Dec., 1899.—*The Weekly Florists' Review* (Chicago and New York), December 14.—*Gardening* (Chicago), December 15.—*American Gardening* (New York), December 9, 1899.—*The Century Book of Gardening*, Part 18.—*Agricultural Journal*, Cape of Good Hope, November 23 and December 7.—*University of Tennessee, Agricultural Experiment Station*, vol. xl, No. 1, April, 1899. *Persimmon*, by K. L. WATTS.—*University of Tennessee Record*, April, 1899, IX., contains: Historical sketch of the University, Courses of Instruction, &c.—*Annales Agronomiques* (Masson & Cie., 120, Boulevard St. Germain, Paris), Dec. 23, contains articles on: Absorption par les plantes de quelques sels solubles, by M. Em. DEMOUSSY; and La Section d'Agronomie au Congrès de Boulogne-sur-Mer, by M. MALPEAUX.—*A Botter and Diary*, from the Anglo-Continental (late Ohlen-dorff's) Gunpowder Works, 80, Mark Lane, E.C.—*Southern Counties Carnation Society*, second annual Report and schedule of prizes to be offered at the exhibition to be held in 1900.—*Torquay District Gardeners' Association*, Report and Balance-sheet for 1899, and prize-lists for the spring show to be held on March 21, 1900, and for the Chrysanthemum show to be held on October 31, 1900.

THE GARDEN AT EILENROC, NEAR ANTIBES.

NEAR Antibes, at the very extremity of the Cape that divides the ancient military city from the beautiful Golfe Juan, is to be found one of the most beautiful gardens that I have ever seen. It is situated at the western extremity of the Cape, the white rocks of which, jutting into the deep, blue sea, have been converted into a rock-garden of great beauty. This garden was visited by the Société de Horticulture of Cannes, which reported most favourably upon it; indeed it is unrivalled even by the botanical garden at La Mortola, which is quite differently arranged.

FIG. 8.—ROCK GARDEN AT EILENROC, NEAR ANTIBES.

might build a special dome over it," said the Director, "but how long would that last? . . . And besides, that would cost too dear." So the Attalea, which was misunderstood in its life, and which knew and resented the fact, fell a victim to ambition and home-sickness, drawing to destruction with it the "little weed" that had been its only faithful friend and companion. Fortunately for hard-hearted directors and gardeners such a botanical specimen is rare, if not unique, in its conduct.

"PUNCH."—This journal is in more senses than one a contemporary, for it appeared in the same year as that in which the *Gardeners' Chronicle* was first issued. In its new guise, and with its additional attractions, we wish it all the success it deserves. We can do no more.

NATIONAL DAHLIA SOCIETY.—Mr. HUDSON informs us that the annual meeting will be held at the Horticultural Club Room, Hotel Windsor, on Tuesday next, January 16, at 2 P.M. In addition to the usual agenda, notice has been given that the following new rule will be proposed:—"No new Dahlias shall be exhibited in competition in any class except:—(1) Varieties which are already in commerce, or are already advertised for distri-

which engages the attention and affects the livelihood of thousands of bright people, is decidedly worthy the investigation of the trained botanist. In the *Cyclopædia of American Horticulture*, therefore, very full accounts are given of the botanical features of all important commercial plants, as the Apple, Cabbage, Rose, &c. At the same time, practical cultivators submit observations upon culture, marketing, and the like, and frequently two opinions are presented upon the same subject from different localities, so that the reader may have before him not only complete botanical information, but very fully the best practice in the most favourable localities for the perfection of any fruit or vegetable or economic plant. The contributors are men eminent as cultivators or as specialists on the various subjects. The important articles are signed, and it is expected that the complete work will include fully 5,000 signed contributions by horticulturists, cultivators, and botanists. The arrangement is alphabetical as to the genera, but systematic in the species. A very simple but complete plan of key-letters is used, and the whole arrangement is toward ease of reference as well as completeness of information. To each large genus there is a separate alphabetic index. A special

Both are wonderfully beautiful and interesting, and both belong to Englishmen, who are courteous enough to admit visitors to see them.

Eilenroc has an area of 15 hectares, and an environment of rocks. In addition, there are 15 hectares of Pine-woods (the Croë Woods) included in the estate. Eilenroc has belonged to Mr. Wyllie since 1873, when he acquired part of it from Mr. Loudon, a Dutch gentleman, who had begun a plantation of Pine. At that time the present garden was a wilderness, overgrown with *Cistus*, *Lentisc*, and brushwood.

On January 1, 1883, Mr. Wyllie engaged a Swiss gardener, M. Ringiusen, who entirely transformed the place, and who is still at his post, improving, enlarging, and embellishing the whole. On his arrival at Eilenroc, M. Ringiusen cut paths, made plantations, and above all began to make use of the splendid natural rocks then considered inaccessible, but which now are traversed with a perfect network of paths and steps. It is this feature that gives uniqueness to the ground. These splendid rocks are in themselves wave-washed and barred, ranged round the villa like a rampart, 140 feet high, with a flower garden on the summit. M. Ringiusen has made in it a labyrinth of paths; easy steps are cut between the fissures and grottos, scaling the roughest crags, and leading from the sea-coast to the terrace, and thence all along and up and down the rocks past many points of view whence on clear days Corsica is visible.

In all the cliffs rising out of the sea, in all the fissures and clefts of the rock, are varied and interesting plants. The local rock-flora has been utilised largely, especially as regards decorative and ornamental species. *Euphorbia dendroides* rears its curious and massive heads, shading the elegant *Cistus*, *Coris monspeliensis*, *Statice*, *Convolvulus althæoides*, &c. And to all these the gardener has added specimens of Australian and Southern Africa, numerous *Polygalas*, *Acacias*, *Aloes*, and so on, and also American *Cacti*, *Agave*, and *Scilla peruviana*. At the time of my visit (March) the rocks were bright with *Crocus versicolor*.

And then, specially protected, is the very rare *Scolopendrium of Antibes*, *S. Hemionitis*. I was much pleased to see its plain, straight fronds, the base of which is cut into two large hanging ears, the blade of which is almost triangular in places. If the rocks form a frame, the picture within it represents a beautiful garden, well planted and maintained. Rare and fine *Palms*, good collections of succulent plants of New Zealand or Australian species, pretty borders and clumps of annuals, and a wonderful collection of such shrubs as will stand the climate; all these form a delightful and interesting whole.

The proprietor of the garden opens it to visitors on Tuesdays and Fridays, charging a franc for admission, which amounts to a large sum every year, and is devoted to a charitable purpose. *H. Correvon, Geneva.*

ENQUIRIES.

ENCOURAGING BIRDS TO BUILD.—Would any reader of the *Gardeners' Chronicle*, who has experience, kindly say what shrubs or climbers are best to plant against a wall in order to get birds to build their nests in the branches? *R. I. L., Botanic Garden, Cambridge.*

FRUITING OF EUONYMUS.—Can any of the readers of the *Gardeners' Chronicle* give a solution to the following query?—I have grown the green *Euonymus* for the last thirty years; during that time I have never seen a berry on them until the present season (that is, in my own garden). From time to time a few have been seen in the islands, but very few. This season, however, the bushes are more like *Holly* bushes, the berries are so abundant, and of a beautiful colour. *J. C. Tonkin, St. Mary's, Isles of Scilly.*

TO OBTAIN TREE-SEEDS.—Where can I obtain tree seeds, especially of Coniferous species? Does any nurseryman make a specialty of them? *S. J. Westlake, Woodhall, Exbourne, Devon.*

HOME CORRESPONDENCE.

FERTILE FROND OF ADIANTUM C.V. IMBRICATUM?—In reference to Mr. Hemsley's remarks in your last vol. (p. 475), that if the frond sent was one of the true variety, it had now reverted to its normal form. I have enclosed fronds both fertile and sterile; and, although they vary in form, I do not think you can get a true type of *A. capillus-veneris*. Although I have had specimens of fronds from other sources, they appear to be the same as I have now sent you. Mr. Hemsley quotes Mr. Schneider's remark, that plumose varieties are entirely barren. I have only to refer Mr. Hemsley to the issue of *Gardeners' Chronicle* for August 18, 1888, where there is a record of fertile fronds of *Adiantum t. Farleyense*, which spores had produced young plants of that form; and the *Gardeners' Chronicle* for October 13 of the same year gives an account of their being exhibited by Mr. Walton of Edge Hill Nurseries, Burnley, at the Royal Horticultural Society's Show on October 9. Not only does *A. c. veneris* vary in its seedlings, but many others do also; and I have found as the rhizomes have got older, they have formed their fronds more after the normal form of the parent. Some years back there was a great quantity of *A. Moritzianum* grown, which I am inclined to think was the South American form of *A. c. veneris*; but it seems to have gone, as I have not seen it for some years. *E. Sandford.*

—In reply to the above communication from Mr. Sandford, the first frond I examined certainly appeared to have spores; but the bunch of fronds just received, although they have the appearance of being fertile, have no good spores, or I can find none [nor we either. Ed.]. The fronds were too much curled-up to be certain as to their identity with the variety I have known. Just now I have no growing plants with which to compare them, and I have sent to the Editor the only dried frond I had. There is no accounting for the vagaries and eccentricities of Ferns, and I should not like to be too positive on any point; but in all my writings I am guided by actual personal experience, and I certainly maintain that the variety I have known as *A. c. veneris imbricatum* has never to my knowledge produced good spores, and until Mr. Sandford's communication I had never heard of its doing so. Mr. Sandford does not tell us if he has raised seedlings, or if the fronds sent are from Mr. Masters' variety. I am returning some fronds which I have pressed out, and I think if you compare them with the frond I sent with my last communication, you will find a considerable difference. I should be glad to hear of the experience of other growers regarding this beautiful Maiden-hair. Now, with regard to the second portion of Mr. Sandford's note. I well remember the statement appearing that *Adiantum Farleyense* had proved fertile, and that seedlings had been raised. I sent you notes on the subject, also a very tiny plant, which was obtained by taking the extreme point of a rhizome, and suggested that the supposed seedling was the result of one of these small points being accidentally dropped by the side of the stage where the plant was found growing. I also well remember the plants exhibited at the Drill Hall on October 9, 1888; for on that occasion I was with Mr. H. B. May of Edmonton, and while staging the largest exhibit of Ferns we ever made. I was considerably hindered by friends calling my attention to these so-called seedlings, Mr. Ba-ron being the first to do so; and the opinion I expressed on seeing them was strongly supported by more than one good authority on Ferns and their culture, the most forcible perhaps being that of our old friend, the late Mr. Shirley Hibberd. I should mention that the plants exhibited as seedlings had, so far as I can remember, fronds upwards of 6 inches long, and none of the small basal fronds usually found on seedling *Adiantums*. I have had the opportunity of examining some thousands of

plants since the above date, but up to the present have had no cause to alter my opinion that this beautiful Fern is absolutely barren. I have seen fronds, and enclosed one, which shows some semblance of fertility (but no spores. Ed.). I may add that there are some fine plants here standing about 3 feet high; also others in various sizes, but no spores. As I have said before, there is no accounting for what may happen; and if any one should get a genuine fertile frond, I would travel a long distance to see it. *A. Hemsley, Cambridge Nurseries, Worthing.*

MANURING.—Never was there a more mistaken idea than that of continual dressing of the ground, year after year, with strong manure; the soil gets over fat, Potatoes grow blotchy and become diseased, other vegetables have rank growth, and slugs and worms flourish. If any readers have been following the above practice, I advise them this year not to put on any manure, but give the land, instead, a good dressing of lime, spread evenly over the ground at the rate of 1 bushel to the rod; leave the lime on the surface till the spring, when it should be dug in. An excellent artificial manure mixture for Potatoes is: superphosphate, 3 lb.; kainit, 2½ lb.; nitrate of soda, 1½ lb., per square yard. Apply this evenly over the surface, and work in, not too deeply, with a fork. Some growers prefer basic slag to superphosphate, but although the superphosphate is a little dearer, it gives far better results. Another advantage is that the mixture can be used as liquid-manure, and consequently becomes handy for watering fruit-trees when the buds begin to show, and, later, when the fruit is forming. On loamy land it is often a very good plan to burn a quantity of the loam, together with all the refuse and rubbish which can be got. Dig in the ashes and burnt earth. Growing crops:—A very good fertiliser for giving spring crops a good start is sulphate of ammonia and nitrate of soda, one ounce per yard, care being taken that the powder does not fall upon the leaves. Fowl-manure, being very quick in action, must not be used carelessly, especially amongst growing crops. It is best mixed with twice its own bulk of soil, and applied as a top-dressing. Liquid-manure: a very useful liquid-manure for watering young crops, and even flowers, &c., is made of good guano, using 1 lb. in 20 gallons of rain-water; or, if desired to use dry, then 7 lb. to the rod (30 square yards) is ample. House-slops are good, but should be diluted with an equal quantity of water. *E. H. Potter, South Woodford, Essex.*

THE NEW CHISWICK.—The editorial suggestion that the Royal Horticultural Society's new experimental garden should be acquired rather sooner than later is one that all familiar with the difficulties that surround experimental or trial gardening in old Chiswick must approve of. It will be very interesting to learn from the President, or perha is through the Council's annual report, information as to what has so far been done in the direction of efforts to secure a new site for the needful garden at the ensuing annual general meeting of the Fellows. It will also be interesting to learn whether the Council is annually setting apart any sum for the purpose of creating a new garden purchase fund, or whether it proposes to borrow the sum so required, or how it expects to obtain such a large sum as will be needful for the purpose. Whilst acquiring land, it will be desirable to obtain, if possible, fully 20 acres, and the cost of that area of really good land will be great. Then there will be the cost of fencing it in, largely with walls, the erection of superintendents', foremen's, and other houses, stables, and cart-sheds; numerous sheds and stores for many diverse purposes, the erection of more modern glass-houses and pits, the laying-out of the ground with roads and foot-paths, the trenching and manuring of the ground, and finally planting it with myriads of trees and other things of a somewhat permanent nature. Then it is evident that whilst it is easy to talk of a new Chiswick, the cost of supplying it must be a very considerable one. Naturally, the site must be within easy reach of London, yet far enough out from the metropolis to ensure freedom from the smoke-area. It is doubtful whether it will be possible to secure such a site within 20 miles of London; indeed, it would be folly to purchase ground where in a few years' hence a thick population may be planted. Pure air and ample breathing-space are such essentials, that they must be obtained, even if the distance from London, where

they may be found, seems rather considerable. Naturally a new Chiswick, so remote from the great metropolitan centre, would present many difficulties in the way of paying frequent visits to it. Such visits would be far more costly to most of them than they are now, and would need the giving up to them of the entire day. There would be objections necessarily to be faced. But in a new and extensive garden, how much might be done to help make it full of pleasure and enjoyment to the visitor. If the site be of necessity

part is devoted to the decorative art in gardening, a small refreshment *châlet* where needful food could be obtained by visitors who give notice of their needs, and also those members of the committee who may be required to visit the gardens in the discharge of their respective duties. These are some, though not all, the matters that will need attention whenever the new gardens are formed. It is greatly to be hoped that a suitable site may soon be found, and the transference of the old to the new Chiswick be of early accomplishment. A. D.

spot before Christmas, and we had to use them. Despite this serious drawback, Newton Wonder will be largely grown in the future, as its flavour when cooked is superb. T. Turton, Sherborne, Dorset.

ISLES OF SCILLY.—The flower season here has just begun. *Narcissus Soleil d'Or* is furnishing from out-of-doors as well as the forcing houses many thousands of bunches of flowers for market. The promise of the crop is very favourable. J. C. Tonkin.

CABBAGES.—Few plants have had more attention or played a more important part in the garden, and in our time, than these; and few of us ever tire of growing, writing, or reading about, or eating good, sweet, tender Cabbages. Simple, too, as is their culture, it is by no means so easy as it may seem to keep the home well supplied with fresh, sweet Cabbages throughout the year. Hence, probably the number of good cultivators who have devoted much of their skill and time to the raising of improved Cabbages, and the selection of the finest and truest strains. No crops have been so severely rogued as seedling Cabbages, and many of our more popular strains are models of rigid selection. It was a happy thought of Mr. Wythes to combine the good qualities of the Rosette Colewort with the St. John's, say, Christmas Drumhead. By these and other crosses we might combine the earliest of the best Coleworts with the hardiest of our best winter Cabbages. The first fruit of this cross, Sutton's Favourite, is likely to have a long and useful life. There is often an embarrassing break in continuous supplies between the freezing-out of Coleworts and the coming-in of the early winter, spring, and summer Cabbages. I have known many growers who are ever grumbling that there are too many Cabbages already, but these are seldom found among those responsible for the supply of large households. We may have too many names, but that is a different thing. Most of us have known and grown the same Cabbage under hosts of names. Aliases here in our Cabbage-beds and throughout our gardens are mostly testimonials to good character, not subjects of doubt or suspicion, guilt or crime, as in society or courts of justice; for few good gardeners would devote from thirty to fifty years of their life to perfecting a Cabbage or what-not that was not of sterling merit. Hence I am always charitable to the forest of names that burden not a few of our vegetable, fruit, and flower lists; and there is generally this consolation—that should the newcomer prove yet another of the same with which we have long been familiar, that same will almost certainly prove one of the finest and most useful varieties. Who can say, for example, under how many names he has grown Mr. Wythes' favourite Early Autumn and winter Cabbage, the Winningstadt, sown in May? Or how many varieties we have had as Early York, Portugal, Fulham, Battersea, Imperial, Vanack, &c. As to the latter, I have heard of two gardeners growing it chiefly for fifty years each, one as Vanack, the other as Dwarf Battersea. It is early, compact, hardy, scarcely any stem exposed to the weather. It is also very dwarf; for early work 15 inches between the rows, and 10 inches between the plants suffice. As soon as cut, the Vanack starts afresh, and yields three or four sweet, tender Cabbagelets in an incredible short time. This old standard sort would yield a valuable cross with the Rosette Colewort. D. T. F.

LATE PEARS.—I consider the following varieties of Pears, viz., Glou Morceau, Josephine de Malines, Easter Beurré, and Bergamotte d'Esperen indispensable in order to obtain an unbroken supply of dessert Pears of the best quality to the end of January. For nineteen years at Maiden Erlegh, Reading, I depended chiefly upon these for late supply. My predecessor here, the late Mr. W. G. Pragnell, evidently recognised the value of these Pears, as he not only planted a number of trees of each, but he also planted them as far as possible at the foot of south and west walls. At Maiden Erlegh they were grown on west walls only, and they never failed to ripen satisfactorily. There are many varieties of late Pears sometimes recommended, but like Olivier de Serres, which is a shy bearer, or Beurré Rance, which is flavourless and lacking in appearance, they cannot be depended upon. Late Pears require a warm temperature to

FIG. 9.—AGAVE JACQUINIANA, IN THE GARDEN OF THE HOTEL DU PARC, CANNES.
(SEE P. 30.)

somewhat remote from a railway-station, the Council should arrange to have a vehicle that could convey the respective committees to and from gratis; whilst ordinary Fellows might, on giving a preliminary notice, be carried backwards and forwards at a small charge. It may be even possible for the Council to come to some arrangement with the conveying railway company to carry Fellows going to the garden station at reduced rates on showing their membership-tickets. Then it may also be possible to erect in the gardens where some

HAMBLING'S SEEDLING AND NEWTON WONDER APPLES.—Are these two very fine exhibition Apples going to bear out the high character as late keeping sorts they were given when distributed? I have been greatly disappointed with both varieties in this respect, but Hambling's Seedling in particular. We had about a dozen very fine fruits from a bush tree, all of which burst at the end of November, and were consequently unfit for use. We had a good crop of Newton's Wonder also from a bush-tree, but the finest fruits began to

ripen them satisfactorily after they have been gathered, and the ideal room for storing Apples is unsuitable for ripening late Pears. Here I have had shelves fitted up in the Grape-room for them. It is heated by hot water, and is kept at a temperature of from 45° to 50°. T. Turton, Sherborne.

AGAVE JACQUINIANA.

A CORRESPONDENT writes from the Hotel du Parc, Cannes, December 6, 1898, with reference to the illustration at p. 29. In the centre of the picture may be seen the large Agave which I had previously mentioned. Before flowering it was about 8 to 10 ft. (2.50 mètres to 3 mètres) high, and 15 ft. (4.50 mètres) in breadth, if not more, whilst the flower-stem itself was quite 16 to 20 ft. (5 to 6 mètres) high.

The flower-spike first made its appearance in February last, when the centre leaves were gradually forced apart, and a number of small leaves were produced. Its actual flowering period is from July to the beginning of August. We had the photograph taken when the stem had reached its full size, but it did not really expand its flowers until about a week later. This consisted of the buds opening slightly, and allowing a number of stamens to protrude; their yellow colour, not to mention the great quantity appearing, produced a most imposing effect.

One of our assistants, a sturdily-built fellow, wanted to have the pleasure of being photographed whilst hanging to the flower-stem, but had to pay dearly for it, as the stem is also provided with sharp thorns, attached to the outer covering leaves. He had, eventually, to take a ladder to get into the position seen on the picture.

Seated astride one of the large leaves is the head-gardener, who was also well scratched about the legs by the thorns at the sides of the leaves. The other is also an assistant. The plant soon began to wither, its leaves having then sunk considerably, and by the time it had done flowering they were all hanging on the ground. We cut them away some time afterwards, leaving only the flower-stem for visitors to the hotel to see.

Behind the Agave, rising above the group of trees, may be noticed the crown of an Eucalyptus Globulus, unfortunately somewhat distinct, being out of focus; whilst adjoining are two Cupresses, the pyramidal one being Cupressus fastigiata. The undergrowth is composed of Quercus ilex, Chamærops humilis and exelsa, and a few Phormiums; whilst the two tall trees to the right and left of picture are Pinus pyrenaica. To the left, below the Pinus, is an Arbutus Unedo (Strawberry-tree). Its fruits are ripe in November, having flowers and ripe fruits at the same time. Across the right top corner an overhanging Phoenix branch has also appeared on the picture.

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 9.—The first meeting of the Committees of this Society for the year 1900 was held in the Drill Hall, James Street, Westminster, on Tuesday last. The display was little better than that shown on December 19, and if we except Orchids, there were very few novelties exhibited. In proportion to the rest of the exhibits, Orchids were very well represented, and many of them were new. There were awarded to these plants one First-class Certificate, one Botanical Certificate, and three Awards of Merit. Other than Orchids, the most important exhibit was one of Chinese Primulas from Messrs. SUTTON & SONS, Reading. This was very extensive, and is remarkable as illustrating a new "break" in regard to colour among the single-flowered varieties.

The only awards recommended by the Floral Committee, which sat for only a few minutes, were to these Primroses. But for two dishes of Pears shown by Mr. Geo. Woodward, Barham Court Gardens, Maidstone, the Fruit and Vegetable Committee might have been presented with white gloves.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. O. Thomas, C. T. Drury, H. B. May, R. Dean, W. Howe, J. F. McLeod, R. B. Lowe, C. E. Pearson, J. Hudson, E. T. Cook, H. J. Outbush, G. Gordon, C. E. Shea, C. Blick, H. Turner, G. Paul, D. B. Crane, and J. Fraser (Kew).

Messrs. SUTTON & SONS, Reading, made an extraordinary display of Chinese Primulas, which fully furnished one of the long tables that run along the length of the hall. The plants were of admirable strains, and no less remarkable for the splendid cultivation they exhibited. A few small Palms relieved the centre of the group, and the plants were edged with young plants of Pteris serrulata. Amongst single-flowered varieties were noticed varieties bearing the following descriptive appellations:—Bellefleur Rose, Blue Snowdrift, The Duchess (see Awards), Crimson King, Rosy Queen, pale rose or pink; Reading Blue, Crimson King. Several of these colours were presented in two types, one with plain, and the other with Fern-like leaves. Among double-flowered varieties were Pink, Scarlet, Carnation Flaked, and White; all of them were very good, and a double-flowered variety is described under "Awards." The "Star" Primulas, or varieties of P. stellata, were shown in pink and white varieties, and were extremely decorative (Silver Flora Medal). Messrs. SUTTON & SONS also showed a few plants in flower of their very distinct-coloured Cyclamen, Salmon Queen, and in addition white, pink, and red varieties of the "Papilio" or Butterfly type of Cyclamen.

Messrs. HUGH LOW & CO., Bush Hill Park Nurseries, Enfield, again displayed a group of Cyclamens with crested flowers. The development of this peculiar characteristic is exceeding interesting, and red as well as white varieties of this type are now obtainable.

Messrs. W. WELLS & CO., Ltd., Earlswood Nurseries, Red-hill, Surrey, showed blooms of two good decorative Chrysanthemums, Kakor, a yellow Japanese, and Letrier, a pure white.

Mr. H. J. JONES exhibited flowers representing the yellow and bronze sports of Chrysanthemum Etiole de Lyon. The bronze sport was figured by us on Dec. 2, 1899, p. 419, and is known as Mrs. Alfred Tate. The yellow one we believe is at present unnamed.

Mr. JOHN N. MAY, Summit, New Jersey, U.S.A., exhibited a new Carnation, "Olympia." The one developed flower had a white ground, and was flaked with bright red.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, made a very pretty exhibit of their Javanico-jasminiflorum Rhododendrons. These were to be seen at the last meetings in the old, as well as the first in the new year, and indeed are always in bloom. None of the varieties are other than charming.

Awards.

Primula sinensis "General French."—An excellent double-flowered variety; colour of flowers deep but vivid crimson. From Messrs. SUTTON & SONS, Reading (Award of Merit).

Primula sinensis "The Duchess."—A most distinct strain in Chinese Primulas, obtained from crossing a single deep red-flowered variety obtained from Mr. H. Balderson upon a pure white variety. The plant certificated had white flowers, with rosy-red colour around the greenish-yellow centre, the rosy colour shading into the white in a very charming manner. The blooms are of fine form, prettily flimbriated, and of much substance. To this variety, showing the latest development in the single-flowered type, was attached the Award of Merit recommended by the Committee as a recognition of the whole strain. From Messrs. SUTTON & SONS.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Little, F. Sander, J. Gabriel, H. J. Chapman, W. H. Young, W. H. White, T. W. Bond, J. Colman, J. Douglas, H. T. Pitt, and J. Gurney Fowler.

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), showed a most interesting group, in which were further evolutions in the Burford hybrid Calanthes. Of these, Calanthe x Limatodes, a cross with Veitchi back on the plant commonly known as Limatodes rosea, an example of which was also shown. The seedling, while retaining the form of C. rosea, was larger and of a darker colour; sepals rose-coloured, margined with white; petals similar in colour, but with the tip only white; lip ovate-oblong, rich carmine-rose, with white eye. Others distinct in form, and showing the influence of Calanthe labiosa were C. x reverens splendens, bright carmine-rose; C. x porphyrea, purplish rose. Also shown were C. x rubro-oculata splendens, a very fine flower; and C. x Phoebe, light rosy lilac (one of Mr. Cookson's hybrids). Other noteworthy plants were Mormodes Buccinator Rolfei, of a rich red-brown (Botanical Certificate); M. B. Warszewiczii, bright yellow; Cypripedium x Fascinator, and Platyclinis uncinata.

Sir FRANKER WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), was awarded a Silver Flora Medal for a fine group, in which was a profuse display of cut spikes of most of the showy Phalaenopsis, most of which had been grown for many years (one of P. Schilleriana for sixteen years). The species shown were Phalaenopsis amabilis, P. Aphrodite, P. Schilleriana, P. Stuartiana, P. Sanderiana, and the fine P. S. Wigan's variety; P. x Gaeta, P. x leucorrhoda, &c., all in more or less quantity. With them were Cypripedium insignis, Wigan's variety; C. x Statterianum, C. x Rothschildianum, very fine; C. x Lecanum, and C. x Marjorie (Lecanum superbum x insignis Sylhetense). Also Lælia Gouldiana, with six

flowers on a spike; L. albidia, Odontoglossum crispum, Cattleya Luddemanniana, cut sprays of the fine purple Pleurothallis Rozeii, and two distinct hybrid Zygo-colax (see Awards).

R. W. RICKARDS, Esq., The Priory, Usk, Mon. (gr., Mr. Murrell), secured a Silver Banksian Medal for a neat group of excellently well-grown Odontoglossum Rossi majus, a magnificent plant of Cypripedium bellatulum, Usk Priory var., with large, broad, fleshy leaves, and bearing three fine flowers with large distant purple spots on the face, and smaller rose-purple markings on the reverse side (Cultural Commendation); a form of Odontoglossum x Andersonianum, Odontoglossum crispum with a six-branched spike, and one with a simple inflorescence; Oncidium Forbesii, and a showy form of Cypripedium insignis.

Messrs. HUGH LOW & CO. staged a good group in the background, of which were three fine forms of Cymbidium Tracyanum, each differing from the others in its markings. In the centre was the fine yellow Cypripedium insignis Laura Kimball, the distinct C. x Lecanum Olinkaberianum, C. L. giganteum, and the soft-tinted C. x insignis-hirsutissimum. Also in the group were two good Cycloches chlorochilum, fine Lælia Gouldiana, &c. A Silver Banksian Medal was awarded.

Messrs. LINDEN, l'Horticole Coloniale, Brussels, sent Odontoglossum crispum Papillon, a fine white variety, with broad segments prettily blotched with brown; O. x Adrianeum, a neat flower of a clear primrose-yellow, evenly spotted with red-brown, the labellum being white, with one large and some smaller brown blotches; Cypripedium Lawrenceanum splendens, a large flower with the dorsal sepal longer and narrower than usual, and tinted and lined with rich rose-purple; and C. x Gowerianum formosum (Lawrenceanum x Curtisii), a noble flower, with the upper sepal very large, tinged with bright rose-purple, the apex and upper margin being white, dark chocolate-purple lines radiate from the base, changing to dark rose as the margin is approached. Petals heavily blotched with raised dark purple spots; lip-face reddish-brown; foliage handsome, like C. Lawrenceanum.

Mr. ED. KRAMER, Raima Nursery, Bandon Hill, showed a good plant of Brassavola nodosa grandiflora.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, showed an interesting group of Cypripediums, including C. x rubrum, C. x calophyllum, C. x Sallieri aureum, C. x nitens superbum, several C. x Lecanum superbum, C. x Spicerianum, C. insignis Maulei, C. l. Forstermanni, C. l. alba-marginatum, C. villosum, C. x Messuresianum, C. x Fitchianum, C. x Williamsianum, C. x Pitcherianum, Williams' variety; and a pretty seedling raised between C. Boxall and C. x Harrisonianum superbum.

Mr. JAS. DOUGLAS, Edenside, Great Bookham, again showed the pretty creamy-yellow Lælia x Briseis (harpophylla x purpurata).

NORMAN C. COOK ON, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray), showed Calanthe x atrorubens (Wm. Murray 9, Oakwood Ruby), a very fine hybrid, of uniform rich purplish-red, the centre being the darkest. The plant is of compact habit; the flowers do not reflex, but arrange well, and are totally distinct from others in colour.

J. T. BENNETT-POW, Esq., Holmewood, Cheshunt (gr., Mr. Downes), showed a plant of the fine Dendrobium spectabile, illustrated in the Gardeners' Chronicle, December 30, 1899, the present variety being more densely marked with purple.

G. W. LAW-SCHOFIELD, Esq., New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill), showed Cypripedium x Lecanum rubrum, with fine red-purple blotches in the upper sepal; and C. x Lecanum grandisepalum, a singular and handsome variety, in which the abnormally-developed lower sepals are white, with a green base, and as showy as the upper sepal.

Sir WM. MARRIOTT, The Down House, Blandford (gr., Mr. Denny), sent Sophro-Lælia x Marriottiana (L. flava 9, S. grandiflora 8), differing in colour from former varieties, those of the present form being tinted like some of the yellow and orange Cannas now so popular. Sepals and petals yellow, with all but the margins flaked with orange-scarlet; lip dark reddish-orange.

Earl BROWNLOW, Ashridge, Berkhamstead (gr., Mr. R. Low), showed a fine plant of Cypripedium x Lecanum with upwards of twenty-five flowers.

Messrs. HEATH & SON, Cheltenham, showed C. x Lecanum viride.

T. W. SWINBURNE, Esq., Corndean Hall, Winchcombe, showed Lælia Jongheana.

Captain HOLFORD, Westonbirt, Tetbury (gr., Mr. A. Chapman), sent flowers of a delicately-tinted Cypripedium, resulting from C. x Godeffianum x hirsutissimum; also C. x Hera Euryades, C. x Lathamianum, and a good Cattleya Percivaliana.

Awards.

Cypripedium x Sir R. Buller.—A grand flower, with some of the aspect of C. x Swinburnei magnificum, but larger and showier. Dorsal sepal very large and flat, emerald green at the base, pure white in the upper half. Lower portion with heavily dotted purple lines, changing to rose-purple on the white upper portion. Petals yellow, tinged with rose, and bearing fine dark purple-brown blotches; lip yellow, tinged with red. From W. M. APPLETON, Esq., Weston-super-Mare (First-class Certificate).

Lælia anceps Leeani.—Flowers white, with purple lines from the base of the lip to the yellow disc. Front of lip and side-lobes tinted pale rose. From Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. White). (Award of Merit.)

Zygo-Colax x Wiganiana (Z. intermedium x C. jugosa).—A well-defined hybrid, apparently with the strong habit of the growth of Z. intermedium. Sepals and petals pale green, barred with light brown; lip white, with violet lines as in

Z. intermedium. From Sir FREDERICK WIGAN, Bart. (gr., Mr. W. H. Young). (Award of Merit.)

Zypo-Colar × *Leopardinus*, *Wigan's variety* (Z. maxillare Gaudieri × O. jugosum).—A very handsome flower, with the sepals and petals of equal proportions, emerald green, closely and uniformly barred with red-brown. Lip violet, with some dark purple markings around the fleshy callus. From Sir FREDERICK WIGAN, Bart. (gr., Mr. W. H. Young). (Award of Merit.)

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. W. Ponpart, Jas. H. Veitch, C. Herrin, Alex. Dean, S. Mortimer, W. Bates, W. Farr, Geo. Wythes, Geo. Woodward, H. Balderson, F. Q. Lane, Robt. Fife, and Geo. Bunyard.

A Cultural Commendation was given to Mr. Geo. Woodward, Barham Court Gardens, near Maidstone, for a dish of excellent fruits of the Pear *Parsé Crassane*.

Award.

Pear Doyenné d'Alençon.—A well-known late Pear, of good quality. Fruit, average size, rather short, thick; skin, light green, very freely marked with patches and spots of russet; eye small, open, set in a shallow depression; stem short and stout, and set in a small basin-like cavity. A good Pear for so late a season, but somewhat gritty at the core. It has been urged as being very similar to *Easter Beurré*, but the fruits are not quite so first-rate. From Mr. Geo. Woodward (Award of Merit).

YORKSHIRE GALA.

THE ANNUAL MEETING.

THE annual meeting of guarantors and life members of the Grand Yorkshire Gala was held last week at Harker's Hotel, York. Ald. Sir C. A. Milward presided, and there was a good attendance.

The Chairman said it was a matter of sincere congratulation to them all that last year's gala was one of the most prosperous in the annals of the institution, and they could only hope that the forthcoming one would be equally prosperous. He was afraid that the holding of the Royal Agricultural Society's Show in the following week would materially affect the attendance at the gala. The Chairman said he had to propose that the Lord Mayor of York be elected President for the ensuing year. This proposition was accepted unanimously. It is twelve years since the present Lord Mayor, who then as now, occupied the chief civic position, also presided over the destinies of the gala.

The Lord Mayor, in accepting the position, said he did not think they need fear that the Royal Agricultural Show would very much affect them. People would go to the Grand Yorkshire Gala, and they might remember that it was held a week before the Royal Show, which was very much better than a week after.

The Lord Mayor then proposed that Sir Christopher Milward be elected chairman of the council, and after very considerable pressure, this gentleman was prevented from vacating the position in favour of a younger man. Sir Christopher Milward has done a very great deal for the Yorkshire Gala. Mr. Alderman Border was re-elected vice-chairman; Mr. Joe Wilkinson, treasurer; and Mr. C. Simmons, secretary.

After the elections to the council had been made, the Lord Mayor proposed that the Society contribute £21 to the Soldiers' and Sailors' Families' (local) Fund, which was agreed to unanimously. The following grants were made:—£650 for the floral fête, £230 for music, £120 for fireworks, £60 for balloon ascents, and £175 for amusements.

SCOTTISH HORTICULTURAL.

JANUARY 9.—The annual meeting was held on the above date. The Association now numbers over 800 members. Horticulturists everywhere will be pleased to learn that, notwithstanding the war, and the change of band at the last moment, the balance-sheet was on the right side. Letters were read from the Lord-Provost of Edinburgh, the Secretaries of the Gardeners' Orphan Fund and of the Gardeners' Benevolent Institution, acknowledging with thanks 50 guineas for the widows and orphans through the African War, and 5 guineas each for the two institutions named. Great interest was taken in the proceedings.

It was stated at the meeting that this was the largest Society of the sort in existence.

Mr. C. W. Cowan, Valleyfield, Penicuik, the president, and afterwards Mr. Alexander McKenzle, Warriston Nurseries, presided. The President expressed the hope that throughout the year the character of the weather would be such as would be for the prosperity of horticulture. Nineteen gentlemen were elected to ordinary membership, and thirty-one were nominated for election, as well as three for life members. The secretary (Mr. R. Laird) submitted the report, which offered congratulations on the continued success and increased prosperity of the association. Reference was made to the general work of the year, including the floral competitions, and fitting tributes were made to the memory of the late Mr. M. Dunn and Mr. W. M. Welsh. Mr. William Mackinnon, the treasurer, reported that the receipts at the Chrysanthemum show were £1038 4s. 8d., while the expenditure came to £1065 5s. 5d., being a balance to the Association's fund of £22 19s. 3d. The ordinary income of the Association, including balance from last year, amounted to £949 6s. 6d., and

after meeting the expenditure the surplus funds at the end of the past year were £777 12s. 1½d. The reports were adopted, and some alterations were made on the rules. Office-bearers, &c., were afterwards elected. The Duke of Buccleuch was again chosen as honorary president, and Mr. Cowan as president. Mr. Laird and Mr. Mackinnon were re-elected secretary and treasurer respectively. D. T. F.

LINNEAN.

DECEMBER 21, 1899.—Dr. A. GUNTHER, F.R.S., President, in the Chair.

Mr. W. G. FREEMAN, F.L.S., exhibited a tree of *Hevea brasiliensis* (Para Rubber), showing the method of tapping adopted in Ceylon.

Dr. R. BRAITHWAITE, F.L.S., exhibited specimens of *Hypnum Hochstetteri*, Schimp., collected by him on the Isle of Barra, Outer Hebrides, the only known locality for it in Europe, though it is found in the Azores and Canary Islands.

The Zoological Secretary communicated a paper by Prof. T. W. BRIDGE, D.Sc., F.L.S., on the "Air-bladder and its connections with the Auditory Organs in the Notopteridae."

Mr. F. CHAPMAN, F.G.S., A.L.S., read a paper on some new and interesting Foraminifera from the Funafuti Atoll, Ellice Islands.

The specimens described, and illustrated by means of lantern-slides, comprised the larger forms found at Funafuti, and on coral-reefs generally, together with a new genus (*Haplocatenia*) and eight new species.

The next meeting of the Society will be held on Thursday evening, January 18, at 8 p.m. precisely, when the following papers will be read:—

Mr. H. M. KYLE, B.Sc.—On the Existence of Nasal Secretory Sacs and of a Nasopharyngeal Communication in the Teleostei.

Mr. GEORGE MARREE, F.L.S.—On the Origin of the Basidiomycetes.

MISCELLANEOUS SOCIETIES.

Wargrave and District Gardeners'.—An ordinary fortnightly meeting was held on Wednesday evening, Jan. 3. The Committee and officers for 1900 were nominated, and the judges' awards in the monthly and fortnightly competitions announced. The prizes will be awarded at the annual meeting, to be held shortly. A paper on "Violets" was read by Mr. Bazeley, of the Twyford Nurseries. He advocated the variety *Marie Louise* as the best for ordinary and market purposes. The kind of soil, manures, aspect, methods of planting requisite, and common diseases and remedies were described. Mr. Pope exhibited some well-grown plants of *Euphorbia jacquiniiflora*, and a nicely-flowered plant of *Sophronitis grandiflora*.

Aberdeen Gardeners'.—The annual social reunion took place in the Bon Accord Hotel on the 3rd inst. About 140 ladies and gentlemen were present. Supper was partaken of during an interval in the dances, and the chair was taken by Mr. Alex. Mortimer, Balnagask, who made a speech in which he reviewed the progress of gardening during the past forty years. Mr. Alex. Robson (Messrs. Smith & Son, seedmen), proposed the toast of "The Gardeners," and there were several other toasts, all of which were well received, and pleasant evening was spent.

MARKET GARDENING.

TOMATOS UNDER GLASS.

SEED should be sown at once to raise plants for planting under glass towards the middle or end of March for fruiting in June. *Chemin Rouge* is the most reliable variety, being a good cropper, the fruit excellent in size, shape, and colour. *Challenger* is another good variety, being a strong grower and free-bearer, the fruit usually attaining to large size, good shape, and fine colour. A few plants of new sorts should only be grown for trial, saving seed of any variety that in cropping quantities, size, shape, and colour of fruit may be considered a decided improvement on older varieties. In the matter of making selections from recent introductions, market-growers require to be very careful, and consider well the pros and cons before discarding old, well-tested varieties for new ones. The above remark is made for the benefit of those readers of the *Gardeners' Chronicle* who are "fresh" to the business of market-gardening; old-established hands are well able to take care of themselves in this direction.

Now the seed thinly in shallow boxes filled to within half an inch of the top, with a compost consisting of sifted soil and short manure in the proportion of three parts of the former to one of the latter, this being made firm with a piece of board before sowing, and after covering the seed lightly with some of the mixture indicated. Each box

should be provided with about five ½-inch circular holes in the bottom, these being covered with pieces of crocks, hollow side down, and a layer of half-rotted leaves for drainage. Place the boxes in a forcing-house, water through a fine rose, and cover with a few squares of glass to confine heat and moisture in the soil, and thereby hasten the germination of the seed. As soon as the plants appear, tilt up the glass a little with a piece of crock or wood in order to inure the seedlings to the atmospheric temperature of the house before removing the glass altogether a few days later. The boxes should be given a position near to the roof-glass. An atmospheric night temperature of 55° to 60° should be maintained, allowing 5° to 15° more in the daytime by fire and sunheat.

When the seedling plants have attained to a height of between 1 and 2 inches, they should be potted singly into 3-inch pots, having a piece of potsherd in the bottom of each for drainage, using the same kind of mixture as that advised for sowing the seed in, this being made fairly firm in potting. Stand the pots on a permanent or improvised stage near the glass, and admit a little fresh air to the house during favourable weather as soon as the plants have pushed their roots into the new soil; water being applied to settle the soil in the meantime. Under the combined influence of increased light and solar heat, the plants will make satisfactory leaf and root growth, and therefore will require more frequent applications of tepid water at the roots, as growth proceeds. Should the young plants by any chance become affected with aphid, the house or pit in which they are growing should be fumigated with *NL-All* vaporising compound before they are planted in the house or houses in which they are to fruit. A space of from 20 to 24 inches should be allowed between the rows in planting, setting the plants at 1 foot from plant to plant in the row, the soil being pressed pretty firmly about the roots in planting.

SWEET PEAS AND MIGNONETTE.

No time should be lost in making good sowings of Sweet Peas and Mignonette in ground which has previously been given a liberal dressing of short manure, ploughed or dug into it, bearing in mind that the better heart the ground is in, the better will be the results obtained therefrom. Sweet Peas should be sown in shallow drills from 3 to 4 feet apart, allowing a space of about 15 inches between the rows for Mignonette. In order to preserve the roots of Mignonette plants from the attacks of wire-worm, a little fresh soot should be strewn along the bottom of the drills before sowing the seed therein. For marketing purposes, Sweet Peas of distinct colours should only be grown. As soon as the Peas appear above ground, a little soil should be drawn up to them on either side, and be dusted overhead with a mixture of lime and soot as a protection from the ravages of birds, which must be guarded against. H. W. Ward, Rayleigh.

THE ROCK GARDEN.

SAXIFRAGA RHEI.

THE genus to which *Saxifraga Rhei* belongs is a most important one for the alpine garden. It embraces plants of great variety in habit, many being among the choicest gems of the garden. The mossy section, to which the one under notice belongs, is the least appreciated; but it nevertheless includes a number of flowers of much beauty. Even the commoner species are very pretty in spring, when the clumps of moss-like verdure are spangled over with the small flowers which, in many instances, are but little raised above the plants. Nor do these flowers exhaust the beauties of the plants, for when autumn comes the foliage assumes its brightest green, and looks cheerful throughout the winter.

The flowers of these *Saxifragas* give us but little

variety of colour. White, of greater or lesser purity, vastly predominates. *Saxifraga Rhei* is one of the few exceptions. When it opens first, the little blooms are of a beautiful pink colour; gradually they become lighter, until they pass off almost to a bluish-white. They are larger, and better formed than those of that little beauty, *S. muscoides purpurea*, which has several aliases, and whose exact name I do not venture to know. The plant is also more vigorous in its habit. One can hardly over-praise this species in the eyes of those who have acquired an affection for *Saxifragas*. The writer has yet a vivid recollection of the admiration it inspired when a friend who had only added it to his collection a short time before drew his attention to it in his rock garden; its beauty was undeniable, and the writer was not long before securing a plant for himself. That is some years ago, but *Saxifraga Rhei* is a favourite whose blooming is watched for yearly with hopefulness.

Like most of the mossy *Saxifragas*, its cultivation presents few difficulties; it grows well in either sun or shade, but has decided objections to drought. It shares this, indeed, with most *Saxifragas* of the same section. It grows very well in a soil composed of peat and sand, but does not object to one of a stiffer nature. [It is a variety of *S. muscoides*. Ed.]

MAZUS PUMILIO.

This alpine plant cannot be kept in the rock garden here for more than a year or two before it dies. It appears to live for several years in other gardens not very far away, and which have an even lower winter temperature. After a good deal of observation and comparison, I have come to the conclusion that it needs some protection from rain during the winter months in this garden. Neighbourhood to the sea has its advantages for gardening, but it has also its drawbacks, and it may be that the frequent freezings and thawings are more injurious to some things than even the winter rains. Of course, we have more rain than those further inland, as what falls in the form of snow a mile inland is represented here by rain or sleet. This may be the cause of the failure of some plants, though the climate is generally very suitable for the growth of alpine. This may appear somewhat foreign to a mention of *Mazus pumilio*, but is necessary to explain the conditions under which some plants fail. It is rather disheartening to have a plant which has grown splendidly for a year or two, dwindle rapidly away just when it had, to all appearance, established itself happily about the stones in the rockeries, and had crept among them in a most pleasing way. However, one becomes, in time, accustomed to these disappointments, for which there is no remedy save the precaution suggested of covering with glass in winter, or keeping a small reserve in a frame or alpine-house.

I know that a good many people have never seen *Mazus pumilio*, although it has been introduced for more than seventy years. A brief description may therefore not be unwelcome to some readers. It grows only 2 or 3 inches high, and has flowers which the casual observer would at a glance imagine to belong to the Pea family, although the *Mazus* is one of the *Scrophulariaceae*. The blossoms are pale purple or violet in colour, with a white centre. The stalks are very short, and rise but little above the leaves, which lie almost flat on the ground. There are little protuberances or tubercles in the mouth of the corolla, and it is from their presence that the plant received its name; *Mazus* being derived from *mazos*, signifying a test.

The *Mazus* may be easily increased by division. It appears to like a soil of peat or loam and sand, and to creep close to stones.

VERONICA NUMMULARIA.

Veronicas present many difficulties to those of us who like to have our plants correctly named. The taller plants in particular are often tantalisingly troublesome to name. There are, however, espe-

cially among these best adapted for the alpine garden, a good number with which there is little or no trouble on this score.

Veronica nummularia is one of the latter class, and its accommodating habit in our gardens is marked. It is aptly named *nummularia*, from the resemblance of its leaves to those of the Moneywort, although on a much smaller scale; they are also produced on creeping branches. The blue flowers, although not large, are quite proportionate to the height and size of the plants on which they are produced. They come into bloom about June, and last for a month or two in flower.

This *Speedwell*, like a number of the other species, appears to prefer a rather moist soil of a gritty nature. It also lasts longer in bloom if not in full sun. It is a native of the Pyrenees, whence it was introduced in 1820. It is a very ornamental and pleasing little plant, with its deep blue flowers, and may be readily increased by division. *S. Arnott, Careethorn-by-Dumfries, N.B.*

TRADE NOTE.

MR. JAMES WEBBER, who has held the position of gardener for the past thirteen years to G. F. Luttrell, Esq., Dunster Castle, Somersetshire, will resign at the end of the present month, in order to commence business as a fruiterer and florist at Minehead.

Obituary.

ALEXANDER BROWN, who has been gardener to W. McAlpine Leny, Esq., of Dalawinton, near Dumfries, for about twenty-three years, expired in a painfully sudden manner on the 4th inst. He was sitting at the fireside in the evening when he complained of a pain in the region of the heart, and soon afterwards died from heart disease. Mr. Brown appeared to be in good health up to the time of the seizure. He was fifty-five years of age, and leaves a widow and two sons.

ANSWERS TO CORRESPONDENTS.

BOOKS: *E. C. C. D., Ashford*. The twelfth edition of *Culpeper's Complete Herbal*, mentioned in our issue for December 30, p. 491, is published by Messrs. Milner & Co., Paternoster Row, London, E.C.—*R. de Blouay. Observations on the Colours of Flowers*, reviewed on p. 491, vol. xxvi., may be obtained from Mr. E. William Hervey, 191, Hawthorn Street, New Bedford, Mass., U.S.A.—*J. B. (1) The Chemistry of the Garden*, by Herbert H. Cousins, M.A.; published by Macmillan & Co., Ltd., Price about 6d. or 1s. (2) *A Text-book of Plant-diseases*, by George Massee, (Duckworth & Co., 3, Henrietta Street, Covent Garden, London, price 5s.)

GARDENERS' BENEFIT SOCIETY: *C. E. F.* You doubtless refer to the United Horticultural Benefit and Provident Society. The Secretary is Mr. W. Collins, 9, Martindale Road, Balham, S.W. You cannot do better than join this excellent society, or recommend to your gardening associates the unique advantages it offers.

GARCINIA MANGOSTANA: *E. Métais*. The *Mangosteen* is a native of the Moluccas. It is also cultivated in the Straits Settlements, in Java, and in several of the West Indian Islands, notably Trinidad and Dominica; and fruits have been produced by cultivated plants in those islands within the last fifteen years. The only recorded instance of its having fruited in Europe was in the garden of the Duke of Northumberland at Syon House, Brentford, in 1885, under the care of Mr. John Ivison. This plant was brought from Calcutta in 1833. It was grown in a stove at Syon, and planted in turfy loam in a pot until about three years before it fruited, when it was shifted into a tub 3 feet square. A house was devoted specially to this plant, which was afforded a bottom heat of from 80° to 90° by means of hot-water tanks, the temperature of the atmosphere varying from 65° to 90°. Plenty of water was given to the plant whilst growing, and it was shaded during bright sunshine. The

first flower expanded on November 18, 1854, when the plant was 15 feet high and 9 feet through. Four fruits were matured by the end of April; they were spherical, nearly 3 inches in diameter, and a reddish-chocolate colour. The flavour was described by Sir William Hooker as delicious, like a mixture of a first-rate Grape and Peach. A figure of flowers and fruits from the Syon plant was published in the *Botanical Magazine* in 1854 (tab. 4847). Several notices of it were also published in the *Gardeners' Chronicle* for that year. In a wild state the trees are said to be about 20 feet high with spreading branches.

GAS-LIME UPON LAWN: *Bristo*. It would not injure your grass if you use but a sprinkling. Do not allow it to be put on carelessly, or in small heaps; and if it is not perfectly fresh, but has been exposed to the air, so much the better.

HYACINTHS: *F. T.* The attachment of the flower-spikes is due to their having grown too fast in proportion to the outer scales of the bulb, which have consequently pinched off the young growths. Another time do not force so much, or so hastily, but allow more time for all the parts to grow equally.

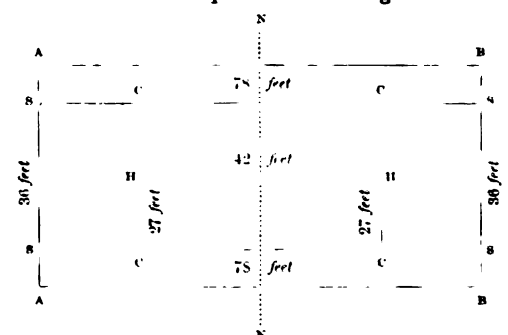

MAPLES: *T. T.* You are not likely to succeed in striking cuttings. The best means of propagation of particular varieties is by budding or grafting, and of the species by seeds, which may be sown in spring or in autumn.

NAMES OF FRUITS: *J. W.* 1, Waltham Abbey Seedling; 2, Scarlet Nonpareil; 3, Smart's Prince Arthur; 4, Golden Noble; 5, Reinette de Canada.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*E. G.* *Odontoglossum Andersonianum*, and *Lælia anceps stella*.—*C.* *Scirpus maritimus*.—*E. G.* *Ruellia Portella*.—*R. W.* 1, *Sophranitis violacea*; 2, *Maxillaria nigrescens*. *J. P., Kaling*. 1, *Coronilla glauca*; 2, *Diplacus glutinosus*; 3, *Hibiscus rosa sinensis*; 4, *Habrothamnus elegans*.—*J. S.* A very fine form of *Dendrobium Wardianum*.

PALM IN DWELLING-ROOM: *H. G. F.* The injury to the foliage of the Palm was doubtless caused by its having been kept in the dwelling-house under the circumstances you suggest. The foliage might have been so injured, and yet not evidence it much until removed to other quarters.

TENNIS COURT: *C. J. D.* and *W. H. R.* The dimensions for a tennis court were given in our last number, but the design which we now reproduce may help you and others the better to understand the requirements of the game:—

A B, B A, double court for three or four players; S S, S S, single court for two players. A A and B B are the base lines; A B, A B, and S S, S S, side lines; C C and C C, service lines; H H, half court line; N N, net. A court for the single game is 27 feet wide, and 78 feet long; and for the double game, 78 feet long, and 36 feet wide. The posts for supporting the net should be placed 3 feet beyond the sides. The service lines run parallel to the net, and are 21 feet distant from the same.

THE FLORA OF CAPE COLONY AND NATAL.

INTERESTS of all kinds centre at the present time in Cape Colony and Natal, and the thoughts of those interested in plants instinctively turn to their favourites from those regions which Professor MacOwan once referred to as having the finest and showiest flora in the world, though the inhabitants took but comparatively little interest in it. If that is true of the colonists generally, the neglect of the majority is, to a certain extent, counterbalanced by the energy of the few, among whom may be named Mrs. F. W. Barber, and her brother Colonel Bowker; the Rev. R. Baur, Mr. H. G. Flanagan, Mr. W. Tyson, Mr. Galpin, Professor MacOwan, the Government botanist, Mr. Harry Bolus; and Mr. J. Medley Wood, who is now doing such good work in publishing the *Natal Plants*.

Botany is not much helped by many of the so-called botanic gardens. Conflicting interests in these, as in most other matters, render it impossible for those who could and would do good work to get the necessary funds. At Cape Town, where Professor MacOwan struggled for years to make the establishment worthy the name of a botanic garden, the lack of sufficient interest shown in the scientific aspect of gardening, ended in the gardens being taken over by the municipal authority, and they are now under the superintendence of Prof. MacOwan's loyal second in command, Mr. H. J. Chalwin, one of the oldest and best respected of British-reared gardeners in Cape Colony,

and who still continues to do what he can for the scientific, though forced to consider mainly the ornamental side of gardening. From 1823 the persevering Drège used to collect plants, and large collections were identified or named by Meyer, Nees, and Kunth, a great many of the specimens having been collected in the now troubled districts of the Drakensberg and Stormberg ranges. Zeyhr and Ecklon also commenced their work at the same time, and the few years following 1823 were the most important in South African botany. Curiously enough, while many new species have been added, often by residents fond of flowers, but not botanists, some of the plants recorded by Drège especially have not again been found.

There is no doubt that in the outlying hills of Natal and the Transvaal, and along the whole of the Drakensberg, there are still many plants of equal importance to the recently-introduced *Richardia Elliotiana* and *R. Pentlandi*, new to science. Recently Mr. J. Medley Wood succeeded in getting two new *Nerines* of quite a new section—*N. pancratioides* and *N. appendiculata*; also *Cyrtanthus O'Brieni*, which discovery was interesting, for the discoverer was attracted to the spot in the hills by seeing a dead Kafir lying there. After his curiosity was satisfied as to the cause of death, a glance around disclosed the pretty orange-scarlet tubular flowers of an evidently new *Cyrtanthus*, which Mr. Baker described afterwards.

A letter from Mr. John Marshall, of Dundee, a large cattle farmer (who has, or had, also a summer farm on the Drakensberg), accompanied by a photograph of a few flowers gathered on his farm, but of which all but the *Brunsvigia Josephinae* (see fig. 10, p. 34), had withered by the heat of the sun, is of special interest, as it was taken shortly before the Boers invaded Natal. Mr. Marshall tells how he had to go with "nothing but what I stood up in. In the morning I could see the other Boers had taken possession of my farm, and had placed their big guns in the paddock just behind my house. Then they burned my home down, wrecked the premises, took all my stock, and thus swept away the fruits of the labours of the best part of my life. I had a nice collection of dried flowers, but now with the rest of my belongings they are ashes."

For one who has lived a pastoral life in an ideal country for thirty years, to be driven away from a home so beautiful by hordes of marauders is a sad experience.

In mentioning the many flowers surrounding him when he gathered those photographed, Mr. Marshall makes one long to be present in quieter times. There were *Clivias*, *Nerines*, *Cyrtanthus*, *Crinums*, *Agapanthus*, *Hæmanthus*, *Gladiolus*, the pretty *Stenoglottis longifolia*, with its elegant lilac-coloured sprays rising from rosettes of purple-spotted green leaves; *Disas*, of which the fragrant white and violet *D. crassicornis* is one of the most beautiful; *Eulophias*, of which a dried flower of a very handsome species is sent; *Richardias*, white, rose, and yellow, a large spathe of a chrome-yellow, with purple centre, sent, being apparently different from either yet introduced.

On these slopes of the Drakensberg, too, the *Anoiganthus*, with their bright yellow flowers, seem to take the place of the *Narcissi* in Europe. There are two species, *A. breviflorus*, and *A. luteus*, which is like a small form of *A. breviflorus*, though it has one or two peculiarities which point otherwise. It has been suggested that *A. luteus* is a highland

form of *A. breviflorus*, as often the same species becomes dwarfer and smaller with altitude; but Mr. J. Medley Wood, who is the best authority, points out that the habitats are the reverse of that suggested. *A. luteus* (the small one), being met with up to 1000 feet, while the larger, *A. breviflorus*, begins where it leaves off, at 1000 to 2000 feet. For plants of such close resemblance a singular reversion of the usual course, whether specifically distinct or not.

The South African *Nerines* have occupied the attention of specialists, and the genus *Cyrtanthus* would be worthy of the same attention, for all are elegant in form, and many brilliant in colour. *C. sanguineus* is one of the handsomest of Natal bulbs, its scarlet *Vallota*-like flowers being the showiest of the genus, and with the allied white *C. helictus* (fig. 11, p. 35) and *C. uniflorus*, would make an interesting group, to which might be added two or three others known to exist.

The tubular-flowered or *Mopella* section of *Cyrtanthus* is well represented in gardens, the most commonly seen being the white *C. Mackenni*, the yellow *C. lutescens*, and the scarlet *C. angustifolius*, which seems to be very variable in form and size according to its habitat. The most beautiful of this class are *C. Macowani* and *C. Tucki*, of a dark scarlet hue, both inhabiting the Boschberg at about 5000 feet altitude, and of the larger species *C. obliquus* (fig. 12, p. 37), *C. carneus*, and *C. Huttoni*, represent a distinct class.

These South African *Amaryllids* grow well in any ordinary greenhouse, and being bulbous plants, require far less care than shrubby plants, and if *Nerines*, *Hæmanthus*, and allied plants are grouped together, the beauty and variety of their flowers soon make them favourites. To the amateur who has no knowledge of the subject, it will simplify their culture if it is said that the main things are to water freely when the leaves are growing, and dry off thoroughly in full sun when the decaying leaves tell that growth is completed.

Vallota purpurea of the southern provinces of Cape Colony is one of the handsomest of South African plants, and an old inhabitant of gardens here, where it is often called *Scarborough Lily*. Cultivation does not seem to have improved this plant, for unless in some few gardens where it thrives well, it is not so handsome as cultivated plants as in the fresh imported ones; also, it has a peculiarity under cultivation of dying out; and in the Channel Islands, in some cases, it has degenerated in quality, and in others been smitten in the same manner as the *Gladiolus* are frequently in gardens.

Let us hope that the time will soon come when the dwellers in South Africa may be again able to devote some attention to their flora.

NEW OR NOTEWORTHY PLANTS.

MASDEVALLIA XANTHINA, VAR. ALBIDA.

THE pretty and floriferous section of *Masdevallia* which includes *M. Estradae*, of which some have considered *M. xanthina* a variety, while others have referred it to *M. Wageriana*, is still further complicated by the charming and distinct form which has just flowered with Mr. F. W. Moore, at the Royal Botanic Gardens, Glasnevin, Dublin, and might as well be considered a distinct species as any of the others named, were it not that we have a note on the subject by its discoverer, Consul F. C. Lehmann, of Popayan, in his notes under *M. xanthina* in the Marquis of Lothian's "Mono-

graph" of the genus *Maedevalia*, so finely illustrated from drawings made by Miss Florence Woolward.

The note runs:—"In plants growing on the volcano of Solari, and at Paiobamba, near Popayan, the flowers are nearly pure white, and have not the purple spot at the base of the lateral sepals, which is a constant feature in the flowers from all other localities."

That states on the best authority that the plant under notice is a variety of *M. xanthina*, provided it is the form referred to, though there are yet one or two details which the late Professor emphasised in his remarks on *M. xanthina* in the *Gardeners' Chronicle*.

"This is a rather pretty *Maedevalia*, with bright yellow flowers, and some dark violet at the base of the sepals, which are a little narrower than the odd one; small petals whitish, lip yellowish, with a dark knob at the apex."

In this variety I fail to find any trace of "a dark knob at the apex" of the lip, but that may have disappeared by the same process of evolution as the other colours of the typical plant. It has the broadly ovate-stalked leaf of the type, thicker in substance than usual; scape 2 inches high; flowers pure white, with a yellow tinge at the base of each of the sepals, which are continued into inch-long yellow tails.

The Glanevin plant is the only plant in cultivation, I believe, the others sent by Mr. Lehmann with it having died on the journey, after the manner too frequent with these charming little *Maedevalias*. *James O'Brien*.

GARDENING UNDER GLASS.*

(Continued from p. 18.)

WATER.—Taking Nature as a guide, we often find many plants thrive under very diverse conditions as regards soil and moisture; as, for instance, among the plants which are native of our own country, the conditions under which the same species is found growing are often extremely varied. This is sometimes to be accounted for by the mutable nature of the species, which enables it to adapt itself to a variety of conditions; but generally there is one set of conditions which is most suited to the welfare of a plant when wild; and if we could be certain that we know what these conditions were, we might safely follow Nature as a guide in the cultivation of such plants. For hardy plants there is, as a rule, less difficulty in affording the conditions supplied to them by Nature; but for plants cultivated in pots under glass this is not so easy, and sometimes it is quite impossible.

The quicker the growth of the plant, and the larger the leaf-area, the greater must be the supply of water at the roots. Plants which grow slowly, and which have not a large leaf-area, will, on the other hand, require less frequent supplies. In a moist atmosphere, such as a stove, there is much less transpiration (perspiration) from the foliage of plants than in an exposed, well-aired house. All large-leaved, thick-rooted plants require an abundance of water when growing; plants with small leaves and fine roots, such as Heaths, *Leschenaultias*, &c., being satisfied with much less. Palms, Crotons, *Dracenas*, *Begonias*, *Agaves*, *Cycads*, and many others, require to be kept constantly moist whilst growing. This is the golden rule with regard to watering—no plant should be allowed to get dry during its growing season, and it is owing to neglect of this that so many plants are injured and often killed.

The second point to be considered is the

resting period, which almost all plants require. There is a popular belief that a plant cannot be rested unless it be subjected to total dryness at the root, and so far as regards a large proportion of the plants we cultivate, this is no doubt correct. But many plants are never naturally subjected to periods of drought. In temperate and northern countries vegetation is forced to rest by lowness of temperature accompanied by much wet. Take as an instance, the resting season for the plants of our own land. Here we have much more moisture, as a rule, in winter than in summer; mistakes are often made in the management of plants through this idea that to rest a plant it must be kept dry. We do not keep our *Roses* or *Camellias* dry when we want to rest them, and

SOILS.

Under the names of loam, peat, leaf-mould, and sand, we have a great variety of soils. The indoor gardener is by force of circumstances generally in the hands of the vendor of these commodities. A soil to all appearances good, may yet contain matter more or less poisonous to the plants for which it is used. It therefore behoves us to take precautions against the use of deleterious soils. Experience enables us to tell with more or less accuracy whether a certain soil is suitable for any species of plant. Even when soils of the best quality are obtained, improper mixing, preparation, condition when used, or defective manipulation when potting, may militate against successful results. There are so many chances of accident

FIG. 10.—THE LAST BOUQUET: BRUNSVIGIA JOSEPHINE, GALTONIA AND KNIPHOFIA. (SEE P. 33.)

(Taken on a mountain-farm behind Dundee, shortly before the Boers burnt down the house, and planted their big guns in the paddock. Much reduced.)

just as the conditions most suitable to them are supplied by lowering the temperature, so also it will be found equally effective with a great many of the exotics we cultivate.

The time to supply water is when it is required—not in the morning or the evening, or at any fixed time, but when the condition of the soil is such as to render water necessary. Much mischief is the result of the idea that the watering must be done only once a day irrespective of weather.

The use of water for atmospheric moisture is a matter which requires thoughtfulness. The right time to syringe, and the right way to do it; damping time, steaming—these are operations which deserve careful consideration. The application of a little common-sense ought to prevent serious mistakes as to time and method, and yet the ill-effects of too little or too much atmospheric moisture, or a too heavy use of the syringe, are too often evident in plant-houses.

in relation to soils in indoor gardening that one might almost venture to recommend the superintendence by a competent person of every operation in connection with their preparation and use. What soil to use for a given plant, if a compost of several, the proportions of each, these are questions which must appeal to the care of the thoughtful gardener. Some horticulturists manage to grow all their plants in a light loam, and it is surprising how great a variety of plants will thrive in loam in combination with sand, leaf-mould, or manure.

Peat of good quality becomes more difficult to procure every year. It is largely used by some cultivators for plants which others grow successfully without it. For Orchids, peat of very fibrous quality is generally by far the best material. Hard-wooded plants, such as *Ericas*, *Boronias*, and *Epacris*, and some stove plants such as *Dipladenias*, cannot be grown successfully except in peat. At the same time, given

* From a paper read at the Kew Mutual Improvement Society.

careful watering, a great many more plants could be grown well without the use of peat than is generally believed. As already stated, much depends upon the physical properties or mechanical condition of the soil, more perhaps than on its chemical properties. In a recent number of the *Gardeners' Chronicle* there is a record of the result of an inquiry into the constitution of Rose soils, with a view to discovering if the soil of any particular locality favourable to Roses differed in its constituents from others. The results are said to be negative. Dr. Bernard Dyer states that after careful study of the chemical results good mechanical and physical condition of the soil, and good drainage, are the probable principal factors in

hesitate to experiment with a view to finding out which soil is most suitable; if a plant is not thriving take it in hand at once, and if the soil appears to be unsuitable try another kind. On the other hand, do not change to another kind of soil if the plant is thriving.

(To be continued.)

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM × SIR REDVERS BULLER.

THIS handsome hybrid, which we illustrate (fig. 13, p. 43), was shown by W. M. Appleton, Esq., Tyn-y-Coed, at the Royal Horticultural Society, Jan. 9, when the Orchid Committee accorded it a well-deserved First-class Certificate. The beauty and stately character of the flower is evident, though

CYPRIPEDIUM × LEEANUM AS A NATURAL HYBRID.

During the last two years on several occasions flowers have been sent for determination which have been declared to have bloomed among imported *Cypripedium insigne*, and which were evidently what in gardens would be called bad forms of *C. × Leeanum*, and in one case with a much nearer affinity to *C. Spicerianum* than to *C. insigne*. The question was a very difficult one to solve, especially as the bad forms of *C. × Leeanum* which often appear in home-raised batches may have drifted anywhere. The question is again revived by a drawing and description of a supposed natural hybrid *C. × Leeanum* by Mr. Osakes Ames in *American Gardening*, Dec. 3, p. 874.

The note says:—"This supposed natural hybrid bloomed among plants of *C. insigne* imported two or three years ago. The scape is weak and droops, so that the flower hangs at a lower level than the leaves. With the exception of the narrow greenish upper sepal, the flower suggests *C. × Leeanum*. That the plant has *C. Spicerianum* in it is highly probable."

In the same number *C. × Deedmannianum* is figured. This combines the characteristics of *C. Chamberlainianum* and *C. Spicerianum*.

SOPHRONITIS VIOLACEA.

Considering that the scarlet *Sophronitis grandiflora* is such a great favourite in gardens, and that it has played a very important and satisfactory part in enabling the hybridists to secure some of the best and brightest-coloured of garden hybrids; and seeing, also, that *Sophronitis violacea* is a plant of similar habit, and with really showy flowers, quite distinct in colour and form from those of *S. grandiflora*, it is a wonder that it is not often met with in gardens, for it was first imported from the Organ Mountains in 1837, and has on several occasions been imported since. The fact is, that the cultivators never appreciated it as they have *S. grandiflora*. Plants of it have flowered well this winter, as in former seasons, in the gardens of the Right Hon. Lord Rothschild, Tring Park (gr., Mr. E. Hill). The compact-growing plants are about the same in habit as *S. grandiflora*, but are different in texture, the grooved inch-high pseudo-bulbs bearing narrow leaves about 2 inches long. The peduncles each bear one to two flowers, each about 1½ inch across, and of a bright purplish-rose colour, which is very attractive. A distinguishing feature from other members of the genus is that the ovate labellum is broader and more conspicuous than the other segments. It thrives in a cool-house with *S. grandiflora*.

VARIATIONS PRODUCED BY GRAFTING, AND THEIR INHERITANCE.

(Continued from p. 13.)

§ 3. Variations on the time or manner of flowering.

—The effects considered under this heading apply to the ordinary and not to the mixed graft. In annual plants, the time of flowering is, as a rule, retarded, but in an irregular way, and according to the plants made use of. In biennial plants, complications arise on account of the respective ages of scion and stock, when the latter is in its first year of growth, and the former in its second, the results already considered may be looked for to a great extent. For instance, a Radish on a Brussels Sprout was retarded three weeks; and a Toad-flax on a Snapdragon a fortnight. When both components are in their first year, the grafted plant flowers at the usual time in the second, the effects of the healing period having worn off by then. Sometimes a like result is obtained when two plants are grafted in their second year. When a stock is tuberous, it is thickened by its scion in the great majority of cases. Exception must be made when the reserve food is inulin, which can only be used by a scion able to "digest" it. A Lettuce grafted on a Salsafy flowered much more rapidly than the control plants. Again, on grafting a biennial in its second year upon a perennial plant, an enormous amount of retardation of the time of

FIG. 11.—CYRTANTHUS HELICTUS: NATIVE OF NATAL. (SEE P. 33.)

the production of good Roses, rather than any special features in the actual composition of the soils themselves. I have more than once been told by chemists that a certain soil would not grow a plant, and on making the experiment have proved that the chemist and the plant did not agree.

There are, of course, many plants for which the most suitable compost is known to all gardeners, but, on the other hand, there are many which require to be experimented upon before we can ascertain what soils are most suitable in combination with other conditions. It is important to look carefully after the texture or physical condition of the soils used, a condition expressed by such terms as open, loose, firm, lumpy, turfy, sandy, well-drained, &c. Never

there may be some doubt as to the parentage which is recorded as *C. × Lucie* (syn. *Smithi*), (*Lawrenceanum × ciliolare*) × *C. insigne*. Nevertheless, it is quite possible that the record is correct. The plant, with its pale green leaves, having a fine, dark green reticulation, and also the flowers, bear some resemblance to *C. × Swinburnei magnificum*. Considering that the plant was a comparatively small one, the size of the flower is extraordinary, and augurs well for its future when fully grown.

The fine dorsal sepal is of a pale green tint in the lower half, with dark chocolate-purple dotted line; the upper portion being pure white, with the basal dark lines continued into it, but of a deep rose-purple. The petals are yellowish, tinged with rose on the outer halves, and blotched with dark purplish-chocolate. Lip greenish, with the ace tinged with reddish-brown.

flowering was obtained. Such is the exceptional case when the Salsafy is grafted on Scorzoneria, for examples, grafted in the month of March did not flower until the following year. In retardation the healing process plays the important part; in acceleration the difference between the functional activities of the two plants produces the results, at least in the majority of cases.

When a stock has no reserve food that can be used by the scion, the latter uses its own supplies to form reproductive organs, and vegetative growth is stopped, as in the case of the Lettuce on Salsafy. Should the stock be without reserves, but able to absorb easily, as in the case of Cauliflower buds on a young Cabbage, after healing, which is a slow process, vegetative growth is continued while the stock is getting the materials from the soil which the scion needs, and flowering is delayed.

From the practical point of view these data may be of considerable value; by retarding the time of flowering until normal plants have passed that stage, hybridisation may be avoided, and by hurrying on the reproductive period ripened fruits may be obtained from plants that, as a rule, flower too late in the year for the seeds to be of any use.

In perennial woody plants flowering time is, normally, reached but slowly, and only when the tree is adult; the period of infertility varies with the plant. Grafting may lessen the purely vegetative period. With well chosen scions it is possible to obtain fruit in the first year. This must not be confounded, of course, with the hurrying on of the fruiting period in annual plants; these are induced to flower earlier in the year, the trees blossoming, with rare exceptions, at the ordinary season, but in an earlier year.

Grafting has also an effect on the arrangement of the flowers. These may, for instance, be crowded together; difficulties in flowering may also occur; petals may be crumpled, buds may become detached, and the blossoms may come to nothing, when those of control plants produce seed.

§ 4 *Parasites in grafting.*—The degree of resistance which plants offer to the attacks of parasites is of supreme importance in horticulture. Such resistance is increased with the vigour of the plant, and is lessened if the latter suffers or finds itself in unfavourable conditions, and grafting may have a marked bearing, temporarily or permanently, on the question.

In all grafts there is a time of provisional union, when the plants are most open to the attacks of parasites. When permanent union begins there is less danger it is true, but they are by no means safe. The kinds of parasites change, and they make themselves felt to a greater or less extent according to the perfection of the graft-union, and the reciprocal conformity of functions in the two grafted plants. During the first period molluscs, such as slugs and snails, are most to be feared; their attacks are due to the lessened vitality caused by the operations in grafting, and not at all to any modification of tissues. Parasitic worms may enter through the wounds or soft tissues; woodlice and millipedes if in great numbers may endanger the success of grafts, and they attack by preference tubers and tuberous roots. There is little to fear from insects at this stage, though small beetles may do much damage. A species of *Cheimatobius*, for instance, lays its eggs in the buds on Apple scions, which should be carefully examined and the eggs removed, or some, if not all, the buds may be destroyed. Moulds do not develop unless there are sufficiently damp conditions, and the stock which has too much water suffers more, as a rule, than the scion which has too little. In the open air, except during heavy rains, moulds do not assume any importance, though when in bad practice the graft and stock are placed under cover they may be of too frequent occurrence, seeing that neither plant is in the surroundings which are suitable to it. When the provisional union is coming to an end, careful attention is necessary to ward off the ravages of parasites. Insects and millipedes come first in order of

importance, then vegetable parasites, and lastly, molluscs, which in the previous consideration were most to be feared. Such a scheme is, of course, by no means absolute, and while woody plants suffer from the members of the first two categories, herbaceous grafts are most likely to be destroyed by those of the last. M. Daniel treats of this aspect in further detail, and sums up the facts by pointing out that the less perfect the connection between scion and stock the more likely are the attacks, saying, "Every badly-made or ill-assorted graft opens the door to parasites."

(To be continued.)

FLORISTS' FLOWERS.

AURICULAS.

IN the proper treatment of these plants during this month, much depends upon the weather. The frames should be covered with mats in frosty weather rather than afforded artificial heat; the lights being drawn off when the weather becomes mild, and air afforded always when there is no frost. Abundance of fresh air is very essential to the Auricula at all times. Let all dead or decaying leaves be removed, and the surface soil stirred occasionally, to prevent the growth of moss, and admit air to the soil. But little water will be required this month, and do not wet the leaves. Upon the first sign of green-fly, fumigate the frame with tobacco-smoke—a most important matter, the insects multiplying very rapidly, and committing havoc on the plants.

HOLLYHOCKS.

Where it is desirable to increase the varieties by the aid of cuttings, place the plants in a temperature of about 50° by night to excite them into growth. As soon as the shoots are long enough, cut them off with a heel, put each singly in a small pot, using sandy soil, with a pinch of white sand at the base of the cutting to induce the quick formation of roots. Let the pots be plunged in a gentle bottom-heat, and cover with a hand or bell-glass; afford water sparingly, and wipe the inside of the glasses night and morning to remove condensed moisture, as too much of this or steam will cause the cuttings to decay. The ground in which these plants are to grow should be deeply trenched and heavily manured. If this is taken in hand at once, it will have settled down near its natural level at planting time—April. The manure, too, will be partly rotted, and in a better condition for the roots. Once or twice between now and then the surface soil will be all the better if forked over, choosing dry weather for the work.

PANSIES.

in pots will need abundance of air to keep them stocky and in health. Dust the inside of the frame with soot to ward off slugs which are partial to the succulent leaves and stems, especially if dead or decaying leaves are allowed to accumulate on the surface. A nightly examination with a lamp will be the means of catching many when feeding. Plants growing in beds or borders may need pressing into the soil with the fingers, as the frost is liable to loosen the roots by the upheaval of the soil, thus disturbing the root action. *E. Molyneux.*

NEW STRAIN OF POTATOS.

Few of the great seed firms associated with gardening have done so much to popularise the Potato as a garden or field vegetable, and as a great article of food, than has the house of Sutton & Sons of Reading. It was that firm that put into commerce the famous Red-skin Flourball, one of the very first of the great disease-resisting strains. This was followed by the introduction of the far more famous and valuable Magnum Bonum. Since then we have seen scores of fine varieties put into commerce

from Reading, varieties that have in gardening become like household words, so widely are they both grown and known. But these popular introductions were of other's raising, and not those of the firm. So far in the matter of Potato-raising, Messrs. Sutton had confined their attention to intercrossing original species with some garden varieties, chiefly for experimental purposes, but in relation to the production of varieties from garden Potatos alone, they had not, up to within the past two years, competed in any way with ordinary raisers. But death, old age, and other causes have materially removed from further active service many of the old Potato-producers. Clark of Christchurch, and Laxton of Bedford, have passed away. Fenn of Sulhampstead, Lye of Market Lavington, and Ross of Newbury, as well as the writer, have almost entirely ceased to intercross or otherwise raise new varieties, so that the field is largely cleared of the old raisers, and there is thus ample room for younger ones to come in and take up the work where others have left it.

Undoubtedly, these raisers have in their work done very much to help bring Potato production up to a high level of excellence. What splendid Potatos we have to-day, and with them existent, how difficult, as is found in so many things horticultural, is it to excel what has thus been created. But the gardening community is never satisfied. Even when perfection is reached, it sighs for yet greater excellence, and so it is with Potatos. We want some that are earlier, or more productive, or that produce a greater proportion of even table-used tubers; also of more perfect form and higher table excellence, for, admittedly, there is ample room for improvement in that direction. Then we want much greater disease-resisting constitution in our varieties than so far has been found, and it is particularly in relation to this feature that Messrs. Sutton & Sons, in embarking upon the work of Potato-raising from seed, have utilised as a parent their excellent Sutton's Flourball, which is not at all the old Red Skin variety previously referred to, although the tubers have bright red skins, but is a mid-season variety of somewhat dwarf habit and a heavy cropper, that so far in the firm's experience has never given one diseased tuber. The first crosses, and modest ones, were made in 1897; but the chief ones, in which the Flourball played so important a part as a progenitor, were made in 1898. The seed thus produced was sown in pans and shallow boxes under glass at the end of March, 1899, and after being duly pricked out thinly into other shallow boxes, and grown on strong, were planted out into the open ground of the seed-farm on May 17, and in rows 2 feet apart, being thence treated just as ordinary Potato-plants from tubers are. The product of every plant lifted and placed in a separate box or partition, I saw the other day in the firm's huge warehouse, set out in blocks according to parentage. One of the most noticeable products was that from crossing the popular Up-to-Date with pollen of the round Red Flourball. It was the product of two seed-balls, and eighty-one plants resulted. In this instance the female parent seemed to be the dominant partner in respect of colour, as only about twelve out of a total of seventy-eight diverse roots were red, all the others being white. But in relation to form, there the male parent seemed to dominate, as the roundness of the Flourball was very much in evidence; but in the matter of productiveness the diversity presented was remarkable. Some roots, no doubt very early ripeners, gave but a couple or three tiny tubers, in all not exceeding half an ounce in weight. But as the other end of the block of seventy-eight boxes was reached, the increase was marvellous, passing into pounds and dozens, until finally culminating in 6 lb. and some forty to fifty tubers. This result will surprise many who have regarded Potato-plants direct from seed as being capable of producing a very few small tubers only. Here, not only in connection with this one cross, but associated with all, were sorts from seed that thousands of growers during the past year would have been delighted to find

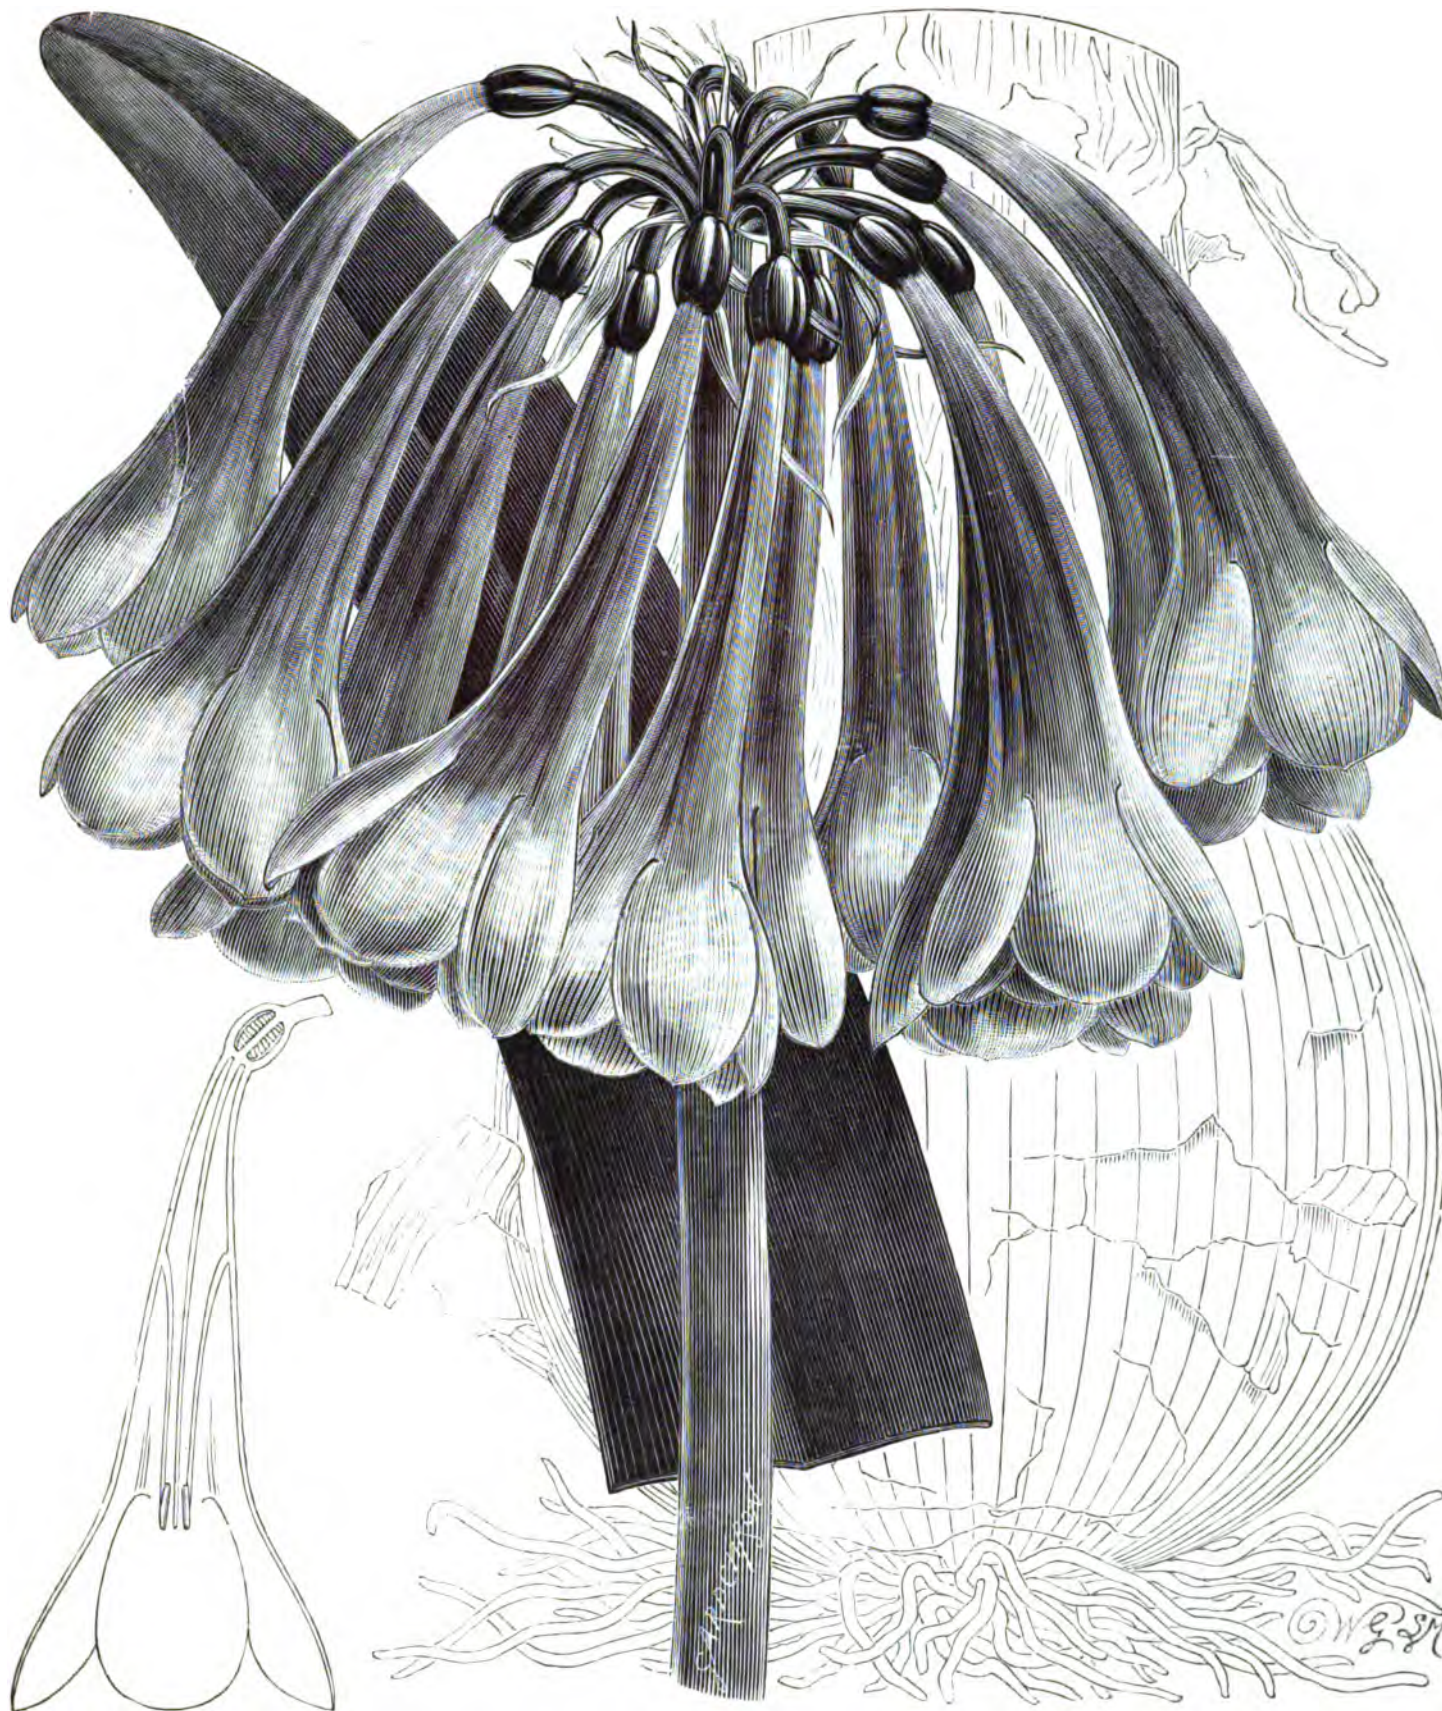

FIG. 12.—CYRTANTHUS OBLIQUUS: NATIVE OF NATAL. (SEE P. 33.)

equalled in production amongst their tuber-raised plants.

The next cross was that of Sutton's Kidney Reliance with the Sutton Flourball, the latter again the pollen-parent. Here was a total of fifty-six boxes, all from distinct seedling-plants. In this case red skins predominated, but

Reliance Kidney has a slightly tinted skin, and the result was not unexpected. Here the smallest produce was one tiny tuber one-sixth of an ounce in weight, and the heaviest one of fifty tubers of admirable seed size, and weighing 3 lb. 5 oz. But here again the round form predominated. Then came Windsor Castle as the seed-bearer, with

Flourball as the fellow parent, the product being forty-two distinct seedling productions. The crops ranged from one very small tuber up to 5 lb. 2 oz., a really remarkable result, and giving over forty tubers to plant next spring if so desired. Here all were round in form, samples clean, and handsome, as might well have been anticipated. The succeeding

block was from *Magnum Bonum* female, with *Flourball* again the male parent; red colour here was much in evidence, and round form greatly predominated.

The crop gave seventy-one lots, ranging from 4-oz. to 3 lb. 4 oz. Schoolmaster as the male, with *Flourball* as the female parent, the position being here reversed, gave nearly all reds, there being but eighteen whites out of fifty-eight diverse seedlings. Tubers ranged as before, from the least up to over 3 lb., and were generally smaller than those found in the preceding crosses. In 1899 *Early Puritan*, female, was crossed with *Early Regent*, male. The produce in plants, owing to the drought of 1898, was so tiny that they were not lifted, but left in the ground all the winter, then covered up with long litter. Some twenty-two lots of these were kept last year, but even under such conditions gave great promise, some roots giving quite a large produce, and very early. Just two or three small tubers lifted out in 1897 were planted in 1898, and six tubers saved from each and planted last year gave really quite heavy crops, as seen in baskets placed for inspection. One or two other crosses were also seen, but those mentioned were the chief. There will have to be a huge trial during the summer, and whenever the lifting takes place may I, like the chronicler of Johnny Gilpin, be "there to see." A.D.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Temperatures, &c.—The changeability of the weather during the present winter has rendered the regulation of the temperature very difficult. On many occasions frosty nights have been followed by mild, wet days, and then, unless great care was taken, the temperatures inside were much higher than was desirable. A high early morning temperature is more injurious to Orchids than at any other part of the day, for measures to reduce it have to be adopted, whereas in the natural course there should be an increase. During unstable weather, the fires should be of small dimensions, and the furnace clean and free, ready for any emergency. The temperatures of the various departments during this and the next month, so far as fire-heat is concerned, should approximate to the following figures:—

	Morning	Midday	Night.
East Indian and <i>Phalænopsis</i> houses	65°	70°	68°
<i>Cattleya</i> and Mexican houses	60°	65°	63°
Intermediate house	55°	60°	58°
<i>Madevalla</i> house	50°	55°	53°
<i>Odontoglossum crispum</i> , or cool-house	48°	53°	50°

With the aid of sunlight, the registered figures may exceed those tabulated, and on the other hand they should not be quite so high during very frosty weather. Until the early morning temperatures have advanced a few degrees, an increase of air should not be afforded, or any water afforded, or damping down performed.

Chysis bracteescens.—Plants resting in a cool part of the *Cattleya*-house since the pseudo-bulbs were matured, will now begin to make a renewal of growth; and they should be placed where there are more light and heat. Water should still be sparingly applied, its needs in this respect being indicated as heretofore by a tendency to shrivel. Until the flower-buds have appeared, little or no root-action occurs, and when it does an increase of water becomes essential. When the flowers have passed away is the time to repot or furnish the plants with new rooting materials. This and other species of hybrids thrive best when planted in small perforated pans, having large quantities of drainage, and a compost of two parts peat fibre, one of fibry loam, and the remainder of fresh sphagnum-moss and finely broken potsherds. Suspend the pans in a position as stated above, and water sparingly until root-action is general and free. The young growths are peculiarly adapted for trips to ravage unseen, and frequent fumigation of the house they occupy should occur to keep them under, or disfigurement and decay will follow.

Platyclinis.—This genus contains several desir-

able graceful flowering kinds seldom met with, owing to the rage for large and more highly coloured Orchids. *P. glumacea* is now in the act of developing new growths and flower racemes, and a more liberal supply of water should be afforded. Immediately the flowers fade, repotting where needed should take place. Excepting when the centre has become bare, division of the ball should not occur, as these plants do not take kindly to disturbance of this nature. Well drained pots or pans, and a compost of two parts peat to one of fibrous loam, and one of chopped sphagnum should be used, sprinkling in a liberal supply of finely broken crocks as the work of potting proceeds. A light warm position in the *Cattleya*-house should be selected for it during the growing period, watering it sparingly until the roots have entered the new soil; afterwards, as the season advances, copious draughts are necessary. *P. uncata* has just gone out of flower, and until new growths and roots appear, the plants should be kept in an intermediate temperature, and watered at rare intervals. The strong-growing *P. latifolium*, requires more warmth, but otherwise the same treatment as the last-named; likewise *P. Cobbiana*. *P. filiformis* thrives best when grown in a suspended basket or perforated pan. The temperature and other prevailing conditions of a *Cattleya*-house fulfil its requirements in those respects. It is now resting, and should have water given it at long intervals, until the new growths project their tiny thread-like roots. Red-spider attacks these, and frequent sponging of the leaves is requisite to keep them free.

Dendrobium aureum, and hybrids derived from it, such as *D. Ainsworthii*, *D. Leachianum*, *D. splendissimum*, &c., though commencing to grow, should not be given much water, or otherwise encouraged to make rapid growth, until the season is further advanced. They should occupy a position where all available light can influence and benefit their tender succulent growths.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ichester, Abbotsbury Castle, Dorset.

Seed Sowing.—Hard-coated seeds, as those of *Cannas*, *Acacias*, *Dracæna indivisa*, &c., all of which are useful in sub-tropical bedding, may be sown at once. Soak the seed in water in a moderately high temperature for a day or two. In the meantime, prepare a fine, rich soil, and crock the necessary pans or pots. These may then be filled with the soil, and placed in heat to await the sowing of the seed. *Begonias*, if required to flower the same season, must also be sown. Great care is necessary, however. The soil must be finer, and the seed should be barely covered with it. When the seeds have been sown, place the pans on a shelf near the light, and exercise the greatest care in watering. If the atmosphere be kept moist, one thorough watering will be sufficient until the seed has nearly germinated.

Picture Shrubs and Small Trees.—These include *Sambucus* (Elder), with yellow and white variegated foliage; *Rhus typhina*, *R. Cotinus*, *R. coccinea*, &c. *Aralia mandchurica*, *Amygdalus atro-purpurea*, *Prunus pissardi*, and any others which make rank over-vigorous growth annually may be spurred back closely if crowding of the heads is feared, or there is a likelihood of other shrubs being overgrown. Do not, however, give any of the shrubs a shorn or unduly formal appearance, but leave some middling long branches at full length, in order to afford a symmetrical and natural contour.

The Planting of Deciduous Shrubs.—If the soil is light, and it has been prepared by manuring and trenching, or if stiff by draining and the addition of coarse strawy manures, planting may now be proceeded with whenever the soil is dry enough to admit of being trampled upon without injury, some finely-sifted soil or potting-bench refuse being first distributed evenly over the roots of the plants, following this with the staple. In planting, first ascertain if the roots are sufficiently moist, if the plants have been bought of a nurseryman, and should there be signs of shrivelling of the bark or rind-covering of the roots, lay them in water for a hour or two, or in soil, and afford water copiously, planting the following day. Bruised or mutilated roots should be neatly removed. It is better to mark the position of each shrub with a long stake, paying attention in doing this to the probable size of the plant or groups of plants will

grow to. Unless this be done much of the natural beauty of the same will be lost. Standard trees and the taller-growing shrubs should be secured and tied to one, two, or three stakes, as may appear necessary. In light soils it is always advisable in planting at this season to pour water copiously about the roots before finally covering them, and even heavy, if dry, should be similarly served.

Bedding Plants.—If many plants are used, propagation of *Verbenas*, *Lobelia* of the *erinus* type, *Alternantheras*, *Coleus*, *Fuchsias*, &c., the established or stock plants at once commence, they should be encouraged to produce strong shoots by affording them a temperature of about 63°, keep them meanwhile close to the front glass on shelves, or near the roof. Watering may be afforded a little more freely to such plants. When the cuttings are large enough, prepare the required number of deep pans or pots, well draining them, afterwards filling them with fine leaf-mould two-thirds, and loam one-third, with plenty of sharp pit or sea-sand. Having done this, make the cuttings, insert them firmly, and afford tepid rain-water to settle the soil about them. On bright days the syringe may be used early in the day, floor and walls damped regularly if a brisk temperature is maintained.

Pelargoniums.—Cuttings of these will now root readily when obtainable from the autumn-struck plants, or from the old stools, if the stock be got into growth, by the use of gentle warmth. Care, however, is needed so as not to spoil the stock-plants by cutting them too hard. Afford both cuttings and stock-plants plenty of light in order to prevent drawing and the culling, a bottom-heat of 75° to 80°.

Celosias pyramidalis.—A sowing may now be made of these attractive plants.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westcombe, Tetbury, Gloucestershire.

Potatoes.—Where new Potatoes are required early in the season, the tubers may now be started into growth. Trays or boxes about 3 inches deep are the best for this purpose. A layer of leaf-mould may be placed over the bottom, and the sets placed upon this at about 2 inches apart. Cover them with more of the same material. They should then be placed in a humid atmosphere at a temperature of 55°, and kept moist by occasional syringings. As soon as the eyes commence to push they should be placed near the light, and they will soon be strong enough to place in pots and pits. Sutton's Ringleader, Veitch's improved early Ash-leaf, and Sharpe's Victor, are excellent varieties, being short in the haulm, very productive, and of good flavour.

Mushrooms.—To keep up a continuous supply of these excellent beds may, at about this date, be made in the open air with stable-litter from corn-fed horses, the long, strawy portion of which should be removed, only the droppings and short litter being made use of. This material should be placed in an airy shed, in quantity enough to form the beds. It should be spread on the floor to the depth of 2 feet, and turned at least once a week so that it may lose a portion of its heat, and become fermented equally in all parts. For an out-of-doors' bed the ridge is the best, and this should have a base of from 4 to 5 feet, and a height of 3 feet, boards 6 inches in depth being nailed to stakes driven into the ground on both sides. Another method of making a bed consists of taking the soil out to the depth of 1 foot, and 5 feet in width, and of any desired length. The manure should then be built up so as to form a ridge from 4 to 5 feet high. Some straw should then be loosely placed over, and testing-sticks put into the bed at various parts. Where the heat is subsiding and slightly below 80°, the beds may be spawned, and in order to prevent the spawn from crumbling when broken, the bricks should be soaked in tepid water, and then divided into about nine pieces, and inserted triangularly in rows 6 inches apart and 3 inches deep in the materials of the bed. The surface should forthwith be covered with a layer of fibrous loam 2 inches thick, beaten down firmly with a spade. Having done this, place as much dry straw over the bed as will retain its heat for some weeks. Field-hurdles thatched with straw should then be placed in a slanting manner and securely fastened over the whole.

Tomatos.—Seeds of early fruiting varieties, viz., *Chemin Rouge*, *Early Ruby*, or other approved varieties, may now be sown in pots filled with a mixture of sifted leaf-mould and loam in equal proportions, and firmly pressed down. The seed should be sown thinly and slightly covered with soil before being placed under handlights to germinate in a temperature ranging from 55° to 65°. After germination has taken place, admit air to the plants gradually, and afford full exposure to the light before drawing takes place.

Forcing French Beans require a temperature of not less than 65°, full exposure to the sunlight, and a certain amount of humidity. Pots 7 inches in diameter are best for the earliest crop, the blooms setting more freely when the roots are severely confined. A good mixture of soil for Beans consists of fibrous loam three parts, decayed manure one part, together with a sprinkling of half-inch bones, the whole being prepared some weeks previously. Before sowing, half fill the pots with this soil and make firm; then sow and cover lightly. The stems of the plants should be earthed up gradually as growth proceeds. *Ne Plus Ultra*, *Syon House*, and *Williams' Earliest-of-All*, are capital forcing varieties, especially the last-named, which will produce excellent pods seven weeks from the time of sowing the seeds.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

Hardy Forcing Plants that are in the open should be established in pots, and introduced to gentle heat. *Lilacs* in variety, *Guelldres Roses*, shrubby *Spiræas*, *Ghent* and *Mollis Azaleas*, are invaluable for the supply of flowers for cutting, and as plants for conservatory and house decoration. It is a good plan to have two batches of each species of plant, and lift them alternate years, thus giving time for the plants to recover from forcing, and become well furnished with bloom. The semi-double Cherry (*Cerasus Watereri*), is the most beautiful plant for forcing introduced during recent years, but is best permanently grown in pots and plunged outside during summer and autumn. *Deutzia gracilis* is also best kept in pots and treated in a similar way. Both should now be top-dressed with rich material, and moved to a cool-house.

Azaleas, Camellias, and hard-wooded plants generally, require to be watered very carefully, keeping them on the dry side rather than otherwise for the present, and quite cool. Keep a sharp look-out for thrips, and when there are any signs of them, use the XL-All vaporiser at intervals of eight or nine days. *Camellias*, planted out and in pots, are greatly benefited by alternate doses of clear water and liquid-manure from a farmyard. At this time of year the latter may not require to be diluted, as the considerable rainfall passing into the tank prevents any excess of ammonia.

Acalyphas, Variegated Abutilons, &c.—The propagation of these plants should be attended to without loss of time. Cuttings of *Acalypha hispida* (*Sanderiana*) strike readily in strong heat, and the plant is readily grown in good loam. As soon as the cuttings are well rooted, move them into 6-inch pots, and grow on rapidly; if large plants are required before flowering, repot before they become pot-bound and syringe the tops frequently, red-spider being a very troublesome pest, and neglect soon causes disfigurement of the foliage. No stopping is required; single stems from 2 to 4 feet high, well furnished with foliage and "catkins" down to the pot, make striking objects. *A. h. tricolor* and other varieties will make good plants in 48's. The colouring of the leaves is very handsome. *Abutilon F. Sawtizer* is a most useful plant, of good habit, for table decoration; an intermediate-house suits its needs, and it grows best in a mixture of equal parts of peat and loam, with plenty of sand. It is also likely to be found useful as a bedding plant, though the variegation is not so white as when the plant is grown under glass. The propagation of this and other varieties may soon be undertaken, with the usual precaution of getting the stock plants into growth.

Caladiums may now be shaken out of the soil and started in pans filled with sand. If an increase of stock is desired, plunge the pans in a brick bottom-heat, and when started, divide the corms with a sharp knife; dip the cut parts in powdered charcoal, and pot in a light mould in 60's.

C. argyrites can be increased to any extent, and grows more freely from parted corms than from old ones. *C. minus erubescens* is equally free, and it makes a good companion to *C. argyrites* when used for the edging of groups.

Hydrangea Hortensia.—Plants may now be placed in heat; yearling plants are more useful when grown in 48's; older plants should have their shoots shortened back to flower-buds, and be top-dressed. *H. paniculata*, which flowers on the current season's wood, should be pruned to two or three buds, and treated in a similar manner; when in leaf syringing it frequently, it being very subject to be overrun with red-spider. *A. Thomas Hogg* is a pure white variety, of slender growth, whose shoots may easily be trained to any kind of shape, and is a most valuable plant for indoor culture, lasting a long time in flower.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Strawberries.—A succession batch of these should be introduced into structures where the conditions are favourable to a gentle start. The first condition necessary to success is a well-rooted, well-developed crown. Plants of this description do not require bottom-heat to make a healthy start. As a preventive against mildew, dip the plants in a strong mixture of sulphur and water. If time permits, top-dress the whole stock of plants, using good fibrous loam, with a little burnt-earth and soot added. This will encourage new roots from the collar of the plant, which will be of great help. The varieties we favour for early work are *Royal Sovereign* and *La Grosse Sucrée*; and for late crops, *British Queen* and *Leader*. A temperature ranging between 45° and 55° for all plants under cover will be sufficient for the present.

Cherries.—The ease, certainty, and also the cheapness, with which Cherries can be forced, should lead to a more extended culture of these fruits under glass. The improvement in the size and quality of the fruit, and also the length of time it will hang after ripening, are additional inducements to plant a house where good varieties of the best kinds of dessert fruit are required during the months of May and June. Any well-ventilated glasshouse, facing south and west, or a span-roofed house running north and south, will suit Cherries. A border 2 feet deep, resting on a good body of drainage materials, and consisting of good garden soil, with a slight addition of turfy loam, and plenty of old mortar-rubble and chalk, will form a compost rich enough for Cherries. The best system of training to employ in order to fill the house quickly with bearing-wood is three three-branched cordons. Trees of this description furnish the trellis much quicker than do trees fan-trained. The most reliable varieties for furnishing heavy crops are the following, which ripen in close succession, viz., *Early Purple Glean*, *Frogmore Early Bigarreau*, *Black Tartarian*, *Monstreuse de Mezel*, and *Bigarreau Napoleon*. The only forcing required is to keep a steady temperature ranging between 45° and 50° up to the flowering period, and this can mostly be accomplished without the aid of fire-heat.

Plums.—To obtain the highest quality in this fruit, and to crop reasonably early in the season in cold districts, glass protection becomes necessary. Last season we planted a lean-to house 180 feet long with young palmette-trained trees of the best dessert varieties; these trees are now well-budded, and afford promise of a good crop of fruit. They are mostly five and seven-branched trees, and by being trained vertically the house will be filled in three seasons. Only a narrow border is provided, and the trees are lifted annually, which develops a dense mass of feeding-roots. Whatever kind of house is adopted, ample ventilation must be provided. The house here is built on Rendle's patent principle—a system that affords a great amount of air in small quantities over all the roof-glass. The soil of the border should be of a retentive nature, capable of holding moisture for some long time. This must be corrected a little by the addition of burnt garden refuse and limestone grit. The following are the best varieties to plant: *Early Transparent Gage*, *Golden Esperen*, *Jefferson*, *Denniston's Superb*, *Oullin's Golden Gage*, *Bryanston Gage*, *Kirke's*, and *Coe's Golden Drop*.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Peaches and Nectarines.—Where the unloosening of the trees and tying the branches to stakes placed some little distance away from the walls, with the view of retarding growth, is practised, the matter should soon have attention. This will afford an opportunity for carrying out whatever pruning is necessary, so that when the time comes to refasten the branches to the wall it may be done expeditiously. Here it is found that equally good results are secured by carrying out the pruning and training at the same time as the other trees. The pruning of Peaches and Nectarines is a small matter if proper attention was paid to the removal of shoots that fruited last season, and it will consist of merely thinning out any superfluous young bearing-wood, and trimming off jagged cuts or snags which could not be conveniently done in the autumn. The pruning of neglected trees will consume more time, as it may be necessary to thin out branches as well as bearing-wood. Much branch-thinning should be avoided as far as possible, as severe gumming often ensues afterwards; but if the branches are much crowded it is imperative to cut out a few of the older ones, so as to make space for younger and more healthy wood. The thinning of the bearing-wood is the next consideration, and this should be done to such an extent that the young shoots will have a clear space of 4 inches between them when trained out, and sufficient should be left to furnish the tree from the centre outwards. Regarding the selection of wood to be retained, give that which is best furnished with fruit-buds and of medium strength the preference. Well-ripened shoots should be left at full length, and cut back only in cases of necessity. Unripened shoots should be pruned back to sound wood and to triple buds, or a single good wood-bud.

Insects.—If the trees are infested with scale, let them be dressed with an insecticide at once if the trees are to be left until the last moment before being trained out; but if they are to be nailed or tied, as the case may be, it is better to defer the cleansing until it is completed, and then to spray them with caustic alkali solution.

Wall Pears.—Like all other hardy fruits the cultivation of Pears, particularly in cordon form, now meets with greater attention. Where proper cultural treatment was accorded the trees during the past season the pruning will now be of a simple description, consisting of cutting back spur-growths left too long last autumn, to two or three buds, and shortening back leading-shoots, whether on cordon or other forms of tree, as far as may appear necessary. Trees on which the spurs have become of great length should have these cut back, with a view of obtaining new growths from the portion left. On some trees spur-pruning may perhaps be unnecessary, but it frequently happens that the buds on the spurs are weak and debilitated through being over-crowded. Here a careful thinning is beneficial, and such is generally found to be more necessary with trees on the Quince than on the Pear stock. Old cordon trees may be rejuvenated by bringing up a new shoot from the base; and young shoots should be left at convenient points in fan and diagonal-trained trees, with a view to replacing worn-out branches in the near future.

Training, Nailing, or Tying.—Some of the hands, if possible, should commence this work directly the pruners have made a good start. Many gardeners wash or dress the trees before this is done, but if well-proved insecticides are used, or the trees sprayed with caustic alkali solution, this may be done afterwards. The great point in training fan-shaped trees is to regulate and lay out the main branches first; these should be secured with tarred twine. Then follow with the subsidiary branches, and afterwards the young wood. If this is done properly, each branch and shoot will then be pointing in an outward direction. In the case of diagonal trees, keep the branches at an equal distance, and as straight as possible. Examine all shreds and ties, and replace with new any that need to be removed. Allow plenty of room when making ties of every description; in the case of wires, pass the material twice round the wire before securing the branch or shoot. Do not tie a strand of raffia to the tip of a shoot to draw it out straight, or it may be strangled. When twine has to be used to secure a branch in position, and there is much strain, place a shred or a piece of old india-rubber tubing between the bark and twine.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JAN. 23 { Royal Horticultural Society's Com-
mittee.

SALES.

MONDAY, JAN. 22.—Ornamental Trees, Roses, Spineas, Tuberoses, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, JAN. 24.—Japanese Lilies, Greenhouse Plants, Azaleas, American Plants, Carnations, &c., at Protheroe & Morris' Rooms.

FRIDAY, JAN. 26.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—33°.

ACTUAL TEMPERATURES:—

LONDON.—January 17 (6 P.M.): Max. 52°; Min. 40°.

January 18: Fine; light frost.

PROVINCES.—January 17 (6 P.M.): Max. 47°, Scilly; Min. 37°, N.E. Scotland.

The Gardeners' Royal Benevolent Institution, the annual meeting of which took place on Friday, the 12th inst., is making satisfactory progress. Its usefulness in alleviating the evils attendant on sickness, poverty, and age, is increasing proportionately. Under the guidance of the Treasurer, Mr. H. J. VEITCH, the finances are in a very satisfactory state, so that at the meeting to which we refer it was possible to elect ten candidates without the trouble consequent upon election by vote in the usual way. These candidates were all persons who, at some time or other, had contributed to the funds of the Society, and helped while they were able to succour those less fortunately placed. In addition to these, six other candidates who had not subscribed to the charity were, by the votes of the members, elected as pensioners. Some of these must feel, we imagine, in the position of those who have had coals of fire placed on their heads.

Of late years some subsidiary funds have been established which have gone far to remove certain objections which used to be raised. The Victorian Era fund, now completed, was established for the purpose of assisting those members of the Institution during the interval between their application and their election. We call them members of the Institution because they have been subscribers for longer or shorter times. The benefits of this particular fund do not extend to those who have not been subscribers.

Candidates, then, who have done what they could in their days of comparative prosperity, are now certain to obtain some relief at once, though they may still have to wait a year or two before they can be admitted to the full benefits of the institution.

Another fund has lately been started, which will assuredly commend itself to the fraternity—the Good Samaritan Fund. The object of this is to afford immediate temporary relief to those in trouble or sickness whose cases have been investigated by the committee.

These two additions greatly enhance the power of the Gardeners' Royal Benevolent Institution for doing good. During our own recollection the number of pensioners has been largely augmented, the amount of the pensions has been considerably increased, and now these two new funds have been instituted. During

all this time, the financial position, always sound, has become more and more satisfactory. There will, no doubt, be large demands this year on our self-sacrifice and our means, but we must take care that while doing our utmost in other directions, we maintain the efficiency of those institutions which it is our special duty and privilege to support.

The Committee gratefully acknowledge their indebtedness to the Stewards, donors of flowers, and to the horticultural press. They likewise tender their thanks to the Honorary Secretaries of the several auxiliaries for their services, and also to other friends throughout the country, who, by arranging concerts, flower stalls, opening their gardens, and in other ways have so materially assisted the Institution. The Committee are glad to announce the formation of an auxiliary at Reading under the presidency of CHARLES E. KEYSER, Esq., and the treasurer-ship of ARTHUR W. SUTTON, Esq. Their thanks are specially due to Mr. SUTTON, to whose influence and indefatigable exertions the establishment of the branch is due.

To the Messrs. N. M. ROTHSCHILD & SONS, who have again contributed their generous annual gift of £105; to the anonymous donor who left four £5 notes at the office "In Memory of Robert Fortune;" and to other friends too numerous to mention who have so generously given to the funds, the Committee offer their thanks.

In respect to the election of pensioners to the Fund, it was decided that William Armstrong, Andrew Bryan, Thomas Chapman, George Chitty, William Hole, Francis Nixon, Samuel Smalley, Richard H. Smith, Joseph Willis, and John Wilson, whose cases had been investigated and appeared to be deserving, be placed on the pension list without election under the power conferred by rule iii., 5.

The additional candidates subsequently elected were Isaac Page, 4519; Lucy Mitchell, 4282; Jane R. Edwards, 3986; Thomas Evans, 3383; William Thomas, 3228; Isabella Watt, 2845. William B. Glasscock received 3346 votes, and would have become a recipient of the pension but for the fact that since the list was published his circumstances had so changed as to render pecuniary aid from the Institution unnecessary.

It was mentioned as remarkable that since the list had been ready, four candidates had died. There were only thirty-seven votes wasted this year through papers not being signed, as against nearly 600 last year.

PATRICK O'MARA.—It is needless to detail the nationality of this gentleman. He is the business-manager of PETER HENDERSON & Co., and has lately been elected President of the New York Florists' Club.

A. HERRINGTON.—A former Chiswick pupil, at one time attached to the Garden, has been elected a Vice-President of the New York Florists' Club. Mr. HERRINGTON has only been in America for four years, so that credit is due to our cousins for their cosmopolitan selection, and to Mr. HERRINGTON for having in so short a time worked his way into so honourable a position.

HUBERT JEAN VAN HULLE, whose death in his seventy-third year at Ghent on the 13th inst. is announced, had one of those distinct personalities whom it is a pleasure to encounter. He was formerly a professor in the Ghent School of Horticulture, and Inspector of the Municipal Plantations. A polyglot linguist, it was his wont to address the jurors assembled from all parts of Europe at the Quinquennial Exhibitions in at least five different

languages. He was a member of that active band who take such an active part in horticultural matters in the Flemish city, and who were likened to the four-leaved Shamrock. The members of this league were MM. RODIGAS, PYNARET, BURVENICH, and VAN HULLE. Well informed, courteous, and energetic, we sympathise with our Belgian friends on the magnitude of their loss.

THE MARQUIS OF BREADALBANE, in response to an invitation of the Council of the Royal Botanic Society, has signified his willingness to join the Council, in place of the Marquis of BUTZ, resigned.

MR. F. MOORE.—Our sub-editor has been the recipient of numerous letters of condolence and sympathy from contributors to this journal on the occasion of the death of his wife; and, being unable from their numbers to thank them individually, he takes this opportunity of conveying to them his gratitude for their kind feelings expressed towards him in his trouble.

THE MARQUIS OF LOTHIAN.—The death of this nobleman is announced. To horticulturists he will be known as the possessor of Newbattle, with its noble Beech-tree. His collection of Masdevallias formed the basis of Miss WOOLWARD's excellent illustrated monograph of that genus.

EARL MANVERS died on the 16th inst. at Thoresby Park, Nottinghamshire. He was in his seventy-fifth year.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of Royal Horticultural Society will take place on Tuesday, January 23, in the Drill Hall, James Street, Westminster, at 1 to 4 P.M. A lecture on "The Neglect of Flowering Shrubs in our Gardens," will be given at 3 o'clock by Mr. GEO. BUNYARD, V.M.H.

ROYAL BOTANIC SOCIETY.—The Brazilian Minister has presented to the Royal Botanic Society two copies of the *Album do Parai em 1899, na Administração do Governo de sua Excia. o Senr. Dr. José Paes de Carvalho*, containing a large number of reproductions of beautiful photographs with explanatory letterpress.

NATURE'S BIRTHDAY.—January 15, being the fifteenth day of Shebat, is, according to our calendar, the new year for trees. Of the four new-years days ordered by the Talmudic authorities none is more apposite than that which recognises that the longest winter nights are over, that the sun renews its warmth to earth; now the forests throw off the lethargy of the winter's sleep, and the sap commences to rise in the trees. *Jewish World*.

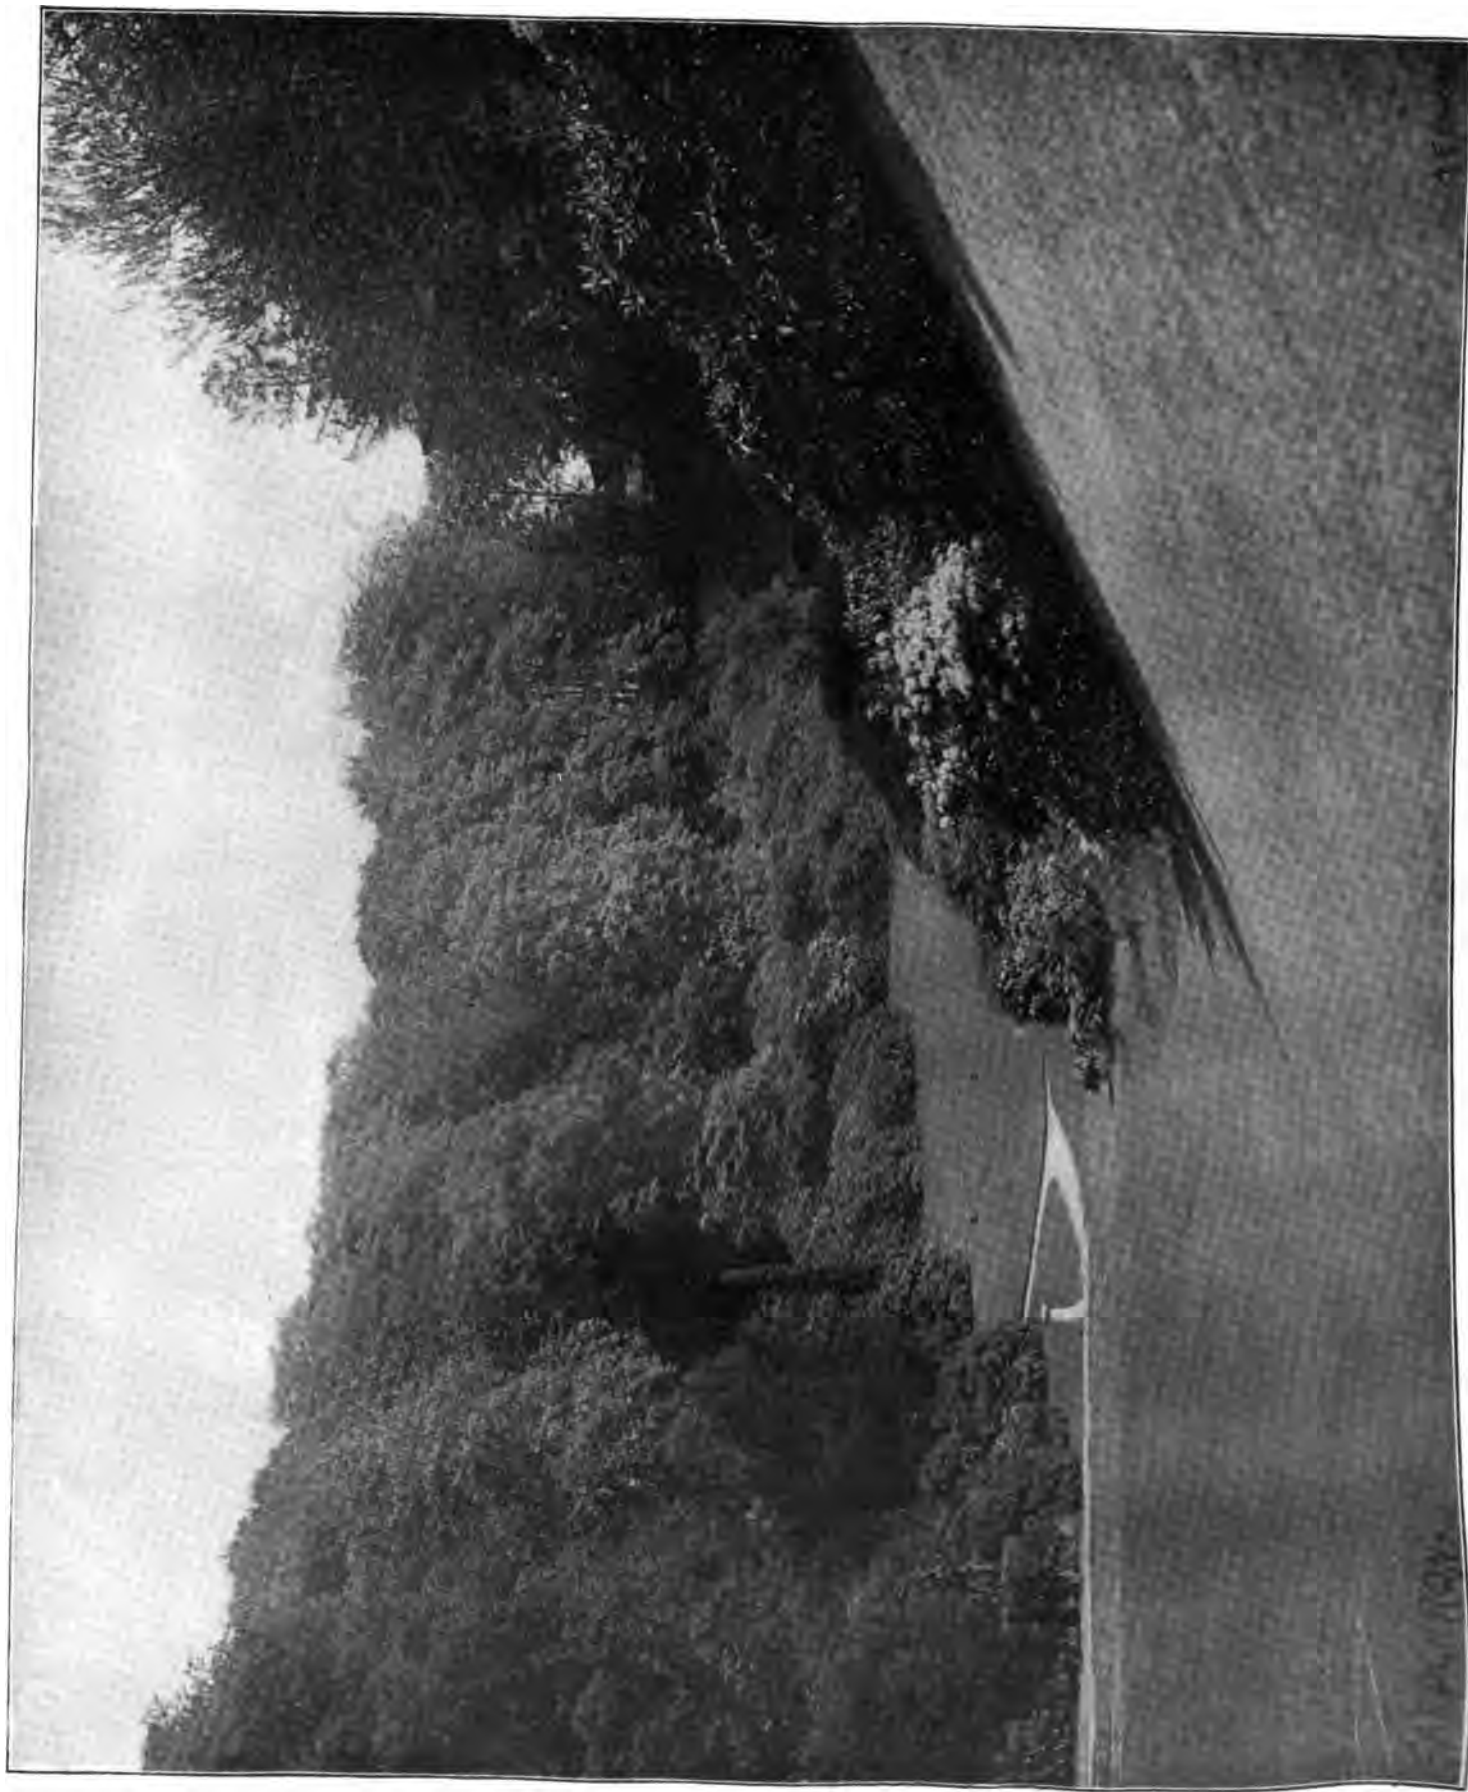

REMEDY FOR GOOSEBERRY MILDEW.—In *Bulletin* No. 133, from the New York Agricultural Experiment Station, potassium sulphide, 1 oz. to 2 or 3 gallons of water was recommended as the best remedy. According to a recently-published report, the results of three years show that it is still the best fungicide the Station has thoroughly tested. Spraying should be begun very early, just as the buds are breaking, and be continued at intervals of about ten days. Further testing will be necessary to determine the relative merits of soda, Bordeaux Mixture, and the copper carbonate solution, in comparison with potassium sulphide solutions for checking Gooseberry-mildew.

SOME FRUIT CROPS OF 1899 IN CALIFORNIA.—We have been informed that this Garden of America has produced 5,250,000 lb. of Figs last year, against 4,780,000 lb. in the preceding year. The "pack" of dried Peaches on the coast is placed at 28,300,000 lb., against 10,960,000 in 1898. The Apricot crop of last year was 7,000,000 lb. compared with 8,240,000 lb. in 1898.

EXPERIMENTS ON MANURING.—From a paper on the "Arrangement of Experimental Plots in Gardens," issued by the South-Eastern Agricul-

THE MANSION AT DEEPDENE, NEAR DORKING THE SEAT OF LILY DUCHESS OF MARLBOROUGH.

VIEW IN THE GROUNDS, DEEPDENE, NEAR DORKING, THE SEAT OF LILY DUCHESS OF MARLBOROUGH.

tural College, Wye, the following are mentioned as being the requisite amounts of manure and the right proportions of their constituent parts: "The quantities required are 2 oz. per square yard of nitrate of soda, sulphate of ammonia, and kainit; 4 oz. per square yard of basic slag or superphosphate; and 1 lb. per square yard of lime." Of course, many other manures will supply nitrogen and phosphoric acid, but the above are the most convenient.

A NEW BEGONIA.—The *Gartenflora* inaugurates the new decade (it calls it the new century) by the description and an illustration of a new fibrous-rooted Begonia from German East Africa. The leaves are obliquely ovate-lanceolate, with two sharply-pointed, widely-spreading lobes at the base. The flowers are small and pink. It may be useful for hybridising purposes. It was discovered by HERR HEDD in West Usambara, and is described by Dr. WARBURG.

RAINFALL AND SUNSHINE OF 1899.—Mr. J. J. WILLIS, of Harpenden, writes:—"The year's rainfall of 1899, according to Sir JOHN LAWES' rain-gauge at Rothamsted, Hertfordshire, which is located 420 feet above sea-level, and is one-thousandth of an acre area in dimension, amounts to 27.14 inches. This is about 1½ in., equal to 152 tons of water on each acre of land, less than the average fall in this neighbourhood extending over a period of forty years. There were seven months which gave an excess of rain compared with the average, and five months recording a deficiency; these latter included March, June, July, August, and September. The total yearly amount of bright sunshine for 1899, according to the Rothamsted measurements, was 1803 hours, whilst at the Royal Observatory, Greenwich, only 1704 hours were recorded out of a possible 4458 hours. The months of January, February, April, November and December were particularly gloomy. The three months which showed less sunshine at Rothamsted than at Greenwich were May, June, and August. In the total twelve months there were 99 hours more of bright sunshine at Rothamsted than at Greenwich.

FRUIT IN ONTARIO.—The 1898 report of the Ontario Bureau of Industries has just seen the light—arriving in London on January 1, 1900. Well, better late than never; but for all that, earlier publication would certainly make a most excellent report of much greater value, or the publication of monthly statements of crop conditions, as in the United States, could not fail to be appreciated in this country. In Ontario, all descriptions of fruit suited for the climate are grown in rich profusion, as testified to by their appearance here, where all are highly appreciated. The fruit-growing area is gradually extending year by year, and all modern means and appliances are in use so as to ensure an even amount of success. The test is to be found here in the prices obtained week by week in, say, London and Glasgow. Spraying, it may be noted, is much in vogue; and its beneficial action is duly noted in sectional reports. The advance of the province in the production of all farm produce, and of a high quality, is very observable.

WILD BIRDS.—The regulations in the County of London prohibit the killing and taking of wild birds from February 1 to August 31, both inclusive; other birds are protected during the whole year. In certain parishes all birds are protected on Sundays throughout the year. The taking or destroying of the eggs of certain birds is also prohibited for a period of five years.

FOWLS IN FRUIT-CULTIVATION.—In the old days of the *Agricultural Gazette*, Mr. Alderman and Sheriff MECHI used to entertain the readers with stories of his agricultural experiences, including the work done by fowls in vegetable-gardens and orchards in clearing-off insect-pests. This sort of work is being done now with approval

in many parts of the world; and from abroad come encouraging reports of the value of chicken-peck. One fruit-grower writes:—"I enclosed half-a-dozen unproductive canker-worm infested Apple-trees in a chicken-yard, and as a result the insects were cleared, and the trees produced good crops of fine fruit." Another wrote:—"The hen has a golden claw; she is a professor of agriculture, too, and teaches clean culture, and lots of it, with high-feeding for a fruit-orchard." *Verb. Sap.*

METROPOLITAN OPEN SPACES.—The year in this respect has opened well, it having been announced that various public parks will be taken in hand by the local public bodies. One is at Ilford, well known for its cemetery; the other at Edmonton, known best, originally, through its connection with that citizen of high renown, yeolept, JOHN GILPIN. As to the first, Ilford, a rapidly-rising suburb, within easy distance of the Liverpool Street Station of the Great Eastern Railway. Here, within the past few years, miles of streets have been constructed, with plenty of garden-ground attached to many of them; and the district council have determined that Ilford must have its "park," and this will, we are told, be constructed at the Green Lanes end of the district, and at the cost of some £10,000. We hope every effort will be made to get value for money. The second open space will be formed out of Prymmes Park, an estate of 53 acres in extent, acquired by the Edmonton District Council, for the purpose of a public park and recreation ground, at a cost of £36,000. The park is well wooded, and contains a lake. It is situated in the heart of a rapidly-increasing neighbourhood, and it is stated that the Middlesex County Council have contributed £6,000 towards the purchase.

ROSE CULTURE IN TURKEY.—We learn from a Constantinople authority that, in order to encourage the cultivation of Roses, and thus to assist in the production of perfumery (attar) throughout the empire, the Minister of Agriculture has distributed 100,000 Rose-trees, of good variety, to agriculturists in seven of the Turkish provinces. In addition to this, loans on easy terms will be made to such producers as require new apparatus and stills, or these will be sold at the lowest possible prices to such as prefer to purchase outright. This assistance does not come too soon.

FLOWERS AND FRAILTY.—A quarter of a century since a contributor to this journal wrote in this place his belief that "beautiful thoughts from angelic minds were born into this world in its lovely flowers." This may or may not be so; but, at any rate, the repetition of the assertion is permissible here in connection with an idea now being carried into activity in the House of Correction, Chicago, by the superintendent, Mr. SLOAN. The most abandoned of women, the class of so-called "unfortunates," are placed under Mr. SLOAN's care, and it has struck that gentleman that no more humanising agent than flower-growing could be used in the reformation of these women. The idea originated in this wise:—A young lady, daughter of a city merchant, had obtained leave to see the female inmates at work in the prison. Her presence was treated as an intrusion by the women, with the exception of one, known as "the Terror," and actuated by a sudden impulse, the visitor took a Rose from her dress, and gave it to the semi-wild inmate. She looked troubled at the gift, but smiled, and said "God bless you." Mr. SLOAN at once seemed to see his way in the matter, and to-day these are doing good moral work in the prison—three greenhouses, 75 by 15 feet, and covering an area of 4000 square feet, duly set out, and tended by these novel practitioners. We think the subject one worthy the attention of our authorities, who might experiment in the first stage with the assistance of outside nurserymen; at any rate, there is the matter for consideration, and it would be pleasant to know that Mr. SLOAN's idea had taken root here.

WEED-KILLER.—Mr. WHITE, a florist, of Worcester, was proceeded against on January 16 in the Queen's Bench Division by the Pharmaceutical Society for selling a weed-killer containing arsenic, he not being a person permitted by law to distribute poisons. It appeared that the florist did not keep the weed-killer in stock, but sent on any orders he might receive to the manufacturers, who executed the order, and gave him a commission. The county court judge of Worcestershire held that the defendant, WHITE, was, within the meaning of the Act, not the seller of the weed-killer. This decision was appealed against by the Pharmaceutical Society, but the court, without hearing counsel for the respondent, dismissed the appeal, and upheld the decision of the county court judge. The Society will have to be more careful in its operations.

THE SALE OF POISONS.—At a meeting recently held in Scotland, Mr. M. CUTHERBERTSON, nurseryman, of Rothesay, asked the LORD ADVOCATE if he would be prepared to support a bill in Parliament making it legal for seedsmen and other agents to sell poisonous preparations such as sheep-dips, insecticides, weed-killers, &c. In reply, the LORD ADVOCATE said that where poisonous substances were dealt with in the way of being dispensed, it was quite right that should only be allowed to be done by qualified persons. But in his view, where they did not need to be dispensed and were supplied by the manufacturer in the final form in which they were to be applied, he did not see that a trade or profession should have a monopoly of selling them, provided proper regulations were made and precautions taken that they would not be supplied or used for any other purpose than those for which they were meant.

OUR ALMANAC.—The demand for this sheet, issued with our first number, has, the publisher informs us, been unprecedented. Although a very large extra number of copies were issued on this occasion, only very few remain. Many fixtures and horticultural arrangements are not made till the spring of the year, and cannot, in consequence, be inserted, but these could be inserted in a second edition should it be required.

LIGUSTRUM OVALIFOLIUM.—Our American cousins are troubled with a great many customs' duties from which we are happily free. Evergreens, for instance, are liable to duty, but deciduous shrubs are not. The customs' authorities seem rather confused as to whether the plant mentioned is an evergreen or not. In this country it keeps some of its leaves till the new ones come; but even a slight frost will cause the detachment of a good many leaves. No doubt local conditions and soil have much to do with the matter. Another source of perplexity to us is, why the species in question is called "Californian" Privet, seeing that it is of Japanese origin.

PUBLICATIONS RECEIVED.—From the South Eastern Agricultural College, Wye, Kent (County Councils of Kent and Surrey), *Hints on the Arrangement of Experimental Plots in Gardens*, A. D. Hall, Principal.—From the New York Agricultural Experiment Station, Geneva, N.Y., the following: *Bulletin*: No. 159, October, 1899, *The Forest Tent Caterpillar*, V. H. Lowe; No. 160, October, 1899, *Report of Analyses of Commercial Fertilizers for the Spring of 1899*, L. L. Van Hyke; No. 161, November, 1899, *Treatment for Gooseberry Mildew*, C. P. Close.—*The Botanical Magazine*, Tokyo, November 20, 1899, contains: *Notulae ad Plantas Asiaticas Orientales* (continued), by J. Matsumura; *Botanische Mittheilungen aus Nikko I.*, by M. Miyoshi; *Plante Japonenses novae vel minus cognitae* (continued), by T. Makino, and various articles in Japanese.—*The American Florist* (Chicago and New York), December 30, 1899.—*The Sydney Mail*, December 2, 1899.—*The Gardener* (Cassell & Co.), January 13, 1900.—*Phanerogamae et Pteridophyta Japonicae Iconibus Illustratae*, or Figures with Brief Descriptions and Remarks of the Flowering Plants and Ferns of Japan (Tokyo), by T. [SEE SUPPLEMENTARY SHEET.]

OUR supplementary illustrations this week are reproduced from photographs taken during last summer at a delightful residence in the county of Surrey. Those who are familiar with the lanes and meadows, the hills and dales, the pretty villages of this county, will remember with lively pleasure the first time they beheld the surpassing beauty of the district around Dorking, and wandered admiringly over Box Hill, the predominating feature of the local landscape. The land around Dorking is so uneven of surface, so distinct from most other parts of the county, that it has been described as "fairy-made," and if this description be apt of the district generally, it most certainly may be applied with special fitness to the estate of The Deepdene. The site upon which the estate is situated is immediately above the little town, and to the south of the Ranmore heights, whilst Box Hill, and at its foot Burford, Sir Trevor Lawrence's home, lie to the east or north-east.

There appears to have existed a remarkable garden upon the site in Evelyn's days, and whilst living a couple of miles away, at Wotton, he mentioned the place in his *Diary*.

About a century ago Deepdene was purchased by Mr. Thomas Hope, who wrote *Anastatus*, and it is still the property of the Hope family, from whom it was leased several years since by Lily, Duchess of Marlborough, who, with her husband, Lord William Beresford, V.C., now resides there.

To a large extent, the charms of Deepdene are the outcome of its natural characteristics. Its surface is nothing more or less than a number of steep or sloping banks and intervening dells and ravines, and its soil is the well known greensand. What more suitable place than such an one could there be for the extraordinary groups of Rhododendrons and Azaleas that there abound? The answer is given by the shrubs themselves, for they have so taken possession of the place, so covered its slopes, scaled its heights, and filled its lowest levels, that it would be a difficult task indeed to eradicate them, even if such a spirit of vandalism could ever be entertained in regard to such a place. The Rhododendrons seed by thousands, and in some of the less trodden of the many shady, almost solitary paths, the pedestrian can hardly avoid crushing the young plants beneath his foot.

Before visiting the south side of the residence from whence the photographs were taken, let us stay for a moment to admire the view upon the north side, where the lawn slopes from the house, and the many splendid old Cedars (C. Libani), a Tulip-tree, probably 70 feet high; several large evergreen Oaks, five or six good specimens of the Purple Beech, in addition to the ordinary Beech, and a few less noteworthy species make the view an attractive one.

Proceeding to the west side, one sees the good effect of the work Her Grace has effected in the removal of large bushes of Rhododendrons that intruded too near the building. This opening out of the immediate grounds around the house was much needed, and even now the pretty spire of St. Martin's Church is hardly visible, and we think a little more of the same work might be advantageously performed. On this west side, adjoining the house is a small flower-garden, but so small that in comparison with the other features of Deepdene, it is hardly noteworthy; and it may be mentioned here that flower-gardening as generally understood, as practised at Blenheim for instance,

in the exceedingly large one illustrated in the *Gardeners' Chronicle* a fortnight ago, is not practised at Deepdene.

Coming now to the south side, the immediate view is that of a steep, grass-clad bank, crowned by Rhododendrons, and rising from close to the house. This extends most of the way along the front, and terminates as shown in our illustrations of the south front as approached from the south east. The Rhododendrons there depicted being most in view have been planted by the Duchess, and are newer varieties with variously coloured flowers. Further in, and this refers to the plantations and thickets of Rhododendrons, over the entire place, the bulk of the plants are of the species *R. ponticum*. On this same bank, and in various positions, are large Bamboos, Broom, and species of a like nature. To the right of the house the photograph shows a fine Horse-Chestnut tree and a Copper Beech. The effect of the position of the camera, however, has given to the tree a greater advantage in height over the house than it actually possesses.

But to obtain the better view we must walk to the extremity shown in the other illustration, and that is a position occupied by an Egyptian Temple (just visible in the photograph), at a height reached through a slightly ascending narrow valley, the sides of which are high banks, covered with Beech trees, with Rhododendrons in front of them, and thence by a flight of 108 steps. It will simplify matters if we say that the two views were taken by turning the camera round and slightly altering its position. The height above described is known as The Terrace, and some very fine views of considerable distinctness are obtained from thence.

Looking from the temple towards the house is a fine view of the features already described, and right away to Ranmore Common at the top of the heights. We should have mentioned that at the base of the narrow valley leading up to the terrace is a small plateau where there is a sundial and several figures. There were a few flower-beds here until lately, but they have been filled with new Roses that Her Grace admired and purchased whilst on a visit to the United States last year. The terrace is the highest point in the gardens, and is above the roof of the dwelling-house.

Turning completely round, and looking south, the view from the terrace is quite of another character, and very extensive. Below is stretched the flat wealds of Surrey and Sussex. On a very bright day it is said that Brighton may be seen. On the terrace to the left we proceed to view Box Hill from this position, and the new forts thereon, that have recently been built to further protect this little island in the remote possibility of invasion. These walks, all of them flanked with great Rhododendron bushes, wind around and back again to the house; but instead of proceeding by that way, we may take the more interesting one in an exactly opposite direction, and thence back to the house on the west side. Starting from the temple, then, the first interesting feature is an avenue of beautiful Beech trees, that seen now are leafless, but not devoid of charm, their large, sleek-looking limbs being admirable. Further along the terrace is an old rustic summer-house built in a tree, from which the view obtained is even more extensive. Now traversing paths, always between Rhododendrons, we descend like so many terraces, one path below another, the space between a thicket of Rhododendrons, such thickets that offer so good a harbour for foxes that about a month ago, upon a hunt-day, as many as four were killed in the gardens. At length the lowest position is reached on the western side, and it is possible to obtain a good idea of the Rhododendrons above. What a blaze of colour when these bloom! Could anything be more gay?

A bed in the base, very nicely sheltered, is just about to be planted with choice Azaleas, such as Anthony Koester, and varieties of comparative merit, that Her Grace has seen displayed at the Drill Hall and Temple shows. We need not further describe the

pleasure-grounds, except to add that at one position to the east of the house a fine specimen of *Abies Douglasii* may be seen, and good trees of *Araucaria imbricata*, *Cryptomeria japonica*, *Sequoia Sempervirens*, *Pinus insignis*, *P. Cembra*, *Abies Pinsapo*, and other Conifers, some of which have reached considerable dimensions, adorn them.

ORCHID AND OTHER HOUSES.

Quite in conformity with the rest of the estate, the kitchen-garden, a walled-in enclosure of some extent, affords hardly a rod of level land. In a garden of slope everything must be grown upon a slope, and it is thus at Deepdene. But good crops are obtained all the same, and especially when the seasons are not abnormally dry ones. The Duchess of Marlborough, ever since she came to England, has been a very liberal patron of horticulture. When at Blenheim she acquired a rich and most valuable collection of Orchids in a short time, and when, upon her husband's death, a large number of these were sold, sufficient were retained to make a good collection in her future residence, which has proved to be Deepdene. But after acquiring the place, it was necessary to build houses suitable for their cultivation before removing the Orchids from Blenheim, and six excellent span-roofed structures were built by Mr. Duncan Tucker, of Tottenham, for this purpose, and for the growth of other plants. They are about 60 feet long, and there is plenty of width and height. They have been built to last a life-time; the front stages are 1½-inch slates, and everything in their construction is of the best. Most convenient means of ventilation has been provided, and in each of the houses a tank runs the length of the centre stage for the storage of rain-water. When after two years storage at Blenheim the Orchids were removed to Deepdene, Mr. Whillans' foreman, Mr. F. Chamberlain, took over the charge of the gardens at Deepdene, and he may be credited in respect to the able manner in which they are now maintained. It is not necessary to write at length of the Orchids, for the present is not by any means the time when they show to advantage. But any reader who may wish to obtain particulars of the collection we would refer to our issue for July 22 of last year, when an able correspondent gave some very interesting notes upon the species that had lately bloomed.

One of the new houses at the present time is filled with Richardias (Arums), just coming to flower, and a large quantity of Cyclamens. Mr. Chamberlain described the strain as that of Messrs. Sutton & Sons. The distinctly-coloured Salmon Queen; the deep Vulcan, and of white, the Butterfly and Giant White were grand, and the cultivation given them most successful.

In another house Souvenir de Malmaison Carnations were its occupants; and in another one winter-flowering Carnations. Mr. Chamberlain is a very successful grower of these plants. He says that Winter Cheer has deteriorated. It is difficult to obtain good blooms from it; the best of the same colour is now John Peter Rufus, but as we saw it the calyx is less satisfactory, though the blooms are larger. In the Palm-house are some beautiful specimens, but if one be mentioned to the exclusion of the others, it should be that of *Kentia Canterburyana*. We have never admired a more perfect plant.

Next we noticed some Roses in pots in a forcing-house. The plants will soon be in bloom; buds are already formed. The new variety, Sunrise, was among them, and a variety that for the purpose Mr. Chamberlain thinks unexcelled, is Souvenir de Wotton; it is so strong a grower, and produces its blooms upon really strong, fine shoots.

That the Orchids are grown well is proved by the splendid specimen illustrated in a supplement to this journal, June, 24, 1899.

We were shown two excellent plants of the variety C. Mendeli Duke of Marlborough, one of the finest of this genus. Her Grace, the Duchess, has been known to observe that she would not accept £1000 for either specimen. The old houses

that have been retained have been entirely renovated; they include vineries, Peach-houses, and such like structures. An excellent stokehole has been made and fitted with powerful tubular boilers, and in all respects the garden is well appointed and liberally maintained.

Mr. Chamberlain is exceedingly proud to show a beautiful gold watch with appreciative words engraved thereon. Three weeks ago [it was a

flower on a plant of *Canna Parthenope*. On examination of the spike it was found to have four flowers, the lowest being typical, the next parti-coloured, the third and fourth typical. The second flower was then fully examined: half of the ovary was found to be green, the remainder chocolate, a part of the stem attaching the ovary to the spike had a broad green streak which extended up the spike to the base of the ovary of the top, or fourth

on a clump of *C. Parthenope*, in the Society's gardens on October 8, three flowers being half Austria and half of the type, two were pure Austria, while one was a true Parthenope. The supposition was that Austria and Parthenope were produced from the same cross, and had their origin probably from seeds yielded by one pod. Another suggestion was that Parthenope was the result of a cross between Austria and some dark flowered

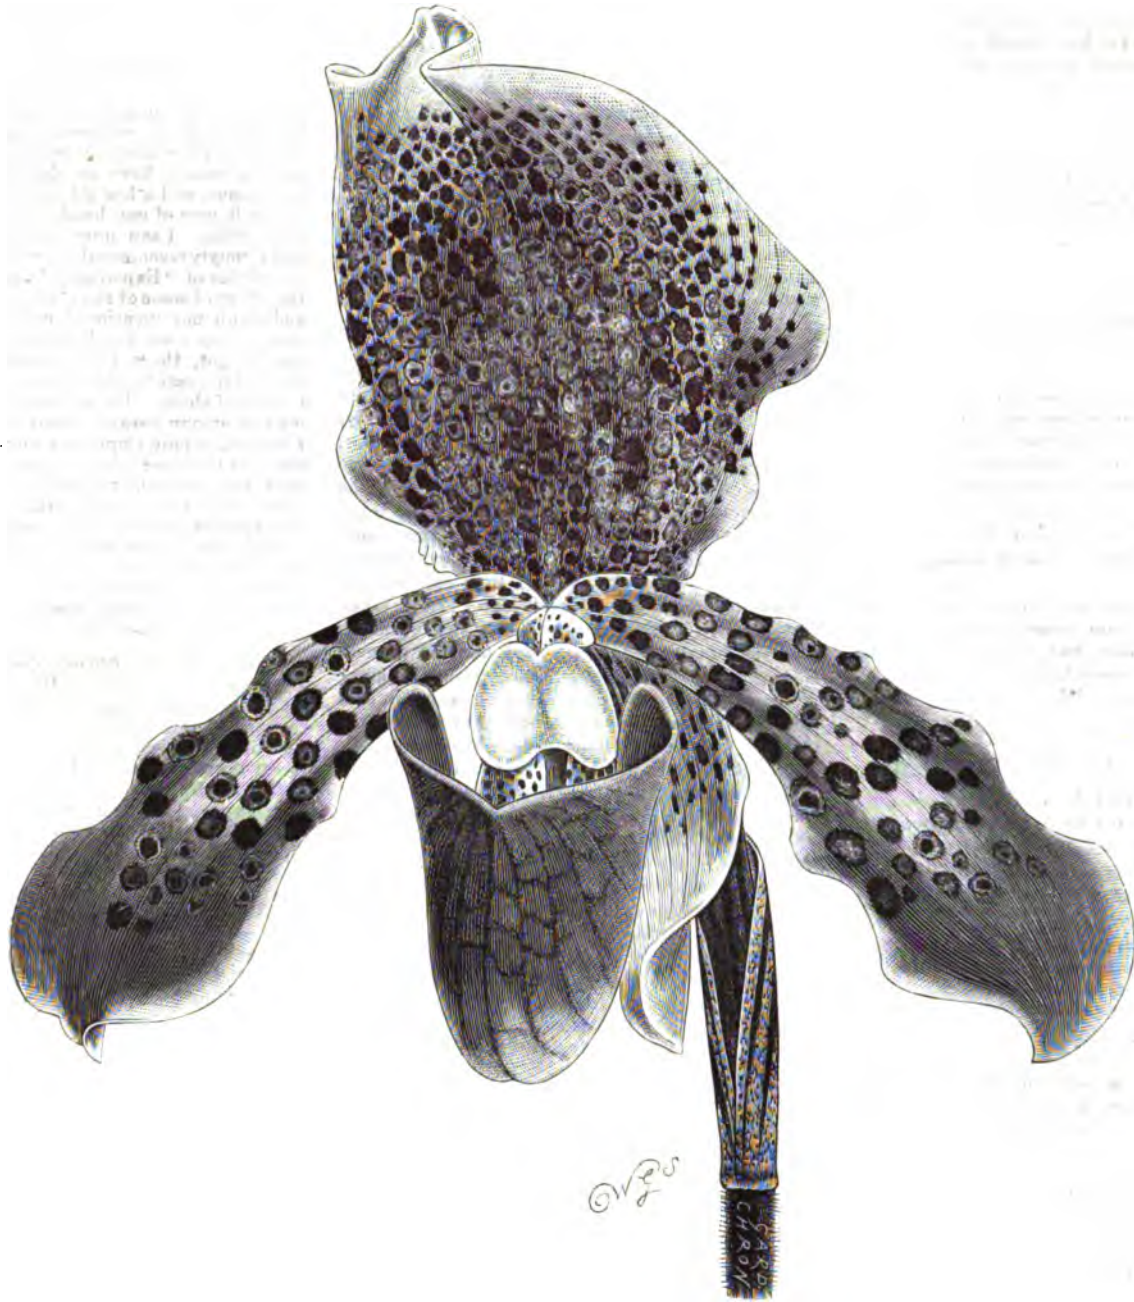

FIG. 13.—CYPRIPEDIUM SIR REDVERS BULLER. (SEE P. 35)

Christmas present from the Duchess and his Lordship, as an accompanying letter said, as a mark of appreciation of his loyalty in service. The circumstance is interesting as showing the kindly feeling that exists between the Duchess and her gardener, and pleasing, because it is a case where merit has met with encouraging recognition.

INDIA.

ANOTHER PARTI-COLOURED CANNA.—On the morning of August 16, Mr. F. G. Clarke discovered in his garden, at Ballygunge, a parti-coloured

flower, there terminating in a fine line. The ovary was cut open, and the interior was found to be coloured similar to the exterior; the petals arising from the green side were found to be yellowish in colour. The flower contained one perfectly yellow petal corresponding in every detail to that produced by *C. Phoebe*, another petal was found to be half Parthenope and half Phoebe; a third, the one commonly called the lip, had one-third painted yellow, and the rest was of the typical colour, the remaining two petals were true Parthenope. In the *Proceedings and Journal*, October-December, 1898, is to be found a report of a sport produced

variety, and had "sported" [reverted to] one of its parents. *Proceedings of the Agri-Horticultural Society of India.*

LAW NOTES.

SEEDS ALLEGED NOT TRUE TO NAME.

HOWCROFT AND ANOTHER v. PERKINS.—This case came on for hearing in the Queen's Bench Division of the High Court on January 13, before Mr. Justice Channell, and was an action brought

by the plaintiffs, seed merchants, against Mr. George Perkins, a nurseryman and market gardener, of Leicester, to recover the balance of an account for goods supplied. The defendant admitted the claim, but set up a counter-claim, which raised a point of considerable interest to seed-merchants, nurserymen, and others.

It appeared that in October, 1898, the plaintiffs' traveller called upon the defendant, and obtained an order for certain quantities of seed, including 1 lb. of Clayworth Prize Celery-seed, the price of which was 3s. The defendant said that instead of supplying him with what he ordered the plaintiffs sent him Turnip-rooted Celery-seed, with the result that the plants which he reared, numbering 14,000, only realised 6d. per dozen instead of 1s. 6d. The defendants contended that the plaintiffs' traveller warranted that he should have what he had ordered, though he admitted that the invoice sent by the plaintiffs after the goods had been delivered contained a clause to the effect that the vendors gave no warranty, express or implied, as to description, quality, productiveness, or any other matter to any goods sent out, that they would not be in any way responsible for the crop, and that if a purchaser did not accept the goods on these terms they were to return them. The plaintiffs denied that there was any warranty, and contended that the defendant was bound by the terms of the invoice, which were common in the trade. They further said that unless they were protected by these terms they would have to go in for an extensive system of insurance. In this case the plaintiff had purchased seed of the value of 3s., and alleged that he had sustained damage to the extent of about £60.

Mr. Justice Channell gave judgment for the plaintiffs, holding that the terms contained in the invoice were reasonable, and binding upon the defendant. Judgment accordingly for the plaintiffs, on the claim and counter-claim, with costs.

CYCLAMENS AT LEES, COLD-STREAM.

WHEN on a visit to the Border district about the end of last November, I called at Lees, and found Mr. Cameron busy amongst his Orchids, which seems to form a great feature of the place; and after having inspected the Calanthes, I passed through the fruit-houses, when, judging by what I saw, the crop must have been rather above the average. Chrysanthemums had been good, but at that late date the best of the blooms had been removed for house decoration.

A long, low span-roof house, with a stage running on either side, and a path up the centre, was entered. It was filled with plants in pots of *Cyclamen latifolium*, intermixed with nice plants of *Eulalia japonica variegata*, forming a very remarkable sight. The Cyclamens were growing in pots that varied in size from 4 inches to 8 inches in diameter, and were adorned with from ten to a dozen fully-expanded flowers on the smaller plants, to more than fifteen on the larger ones. The fine dark green foliage with flowers, ranges from pure white to dark purple, harmonising well with the dot-plants of *Eulalia*. Being greatly taken with this unique display at that dull time of the year, I could not refrain from asking Mr. Cameron a number of questions regarding his method of cultivation, the answers to which I give for the benefit of the readers of the *Gardeners' Chronicle*.

In the first place, he said that they must have a display of flowers during the winter months, and after having experimented with a number of different plants, he had come to the conclusion that for a winter display in a green-house, for cut flowers, and as a decorative plant for the dwelling, nothing can excel the Cyclamen. There may be some other plant that will equal it, but cannot be better. He therefore sowed seed every year about the end of July or the first week in August, plunging the seed in the propagating-case, and in due time the seedlings appear. These are kept as

near the glass as possible, and by the month of December they are ready for potting into thumbs. The potting material consists of good loam, a small quantity of leaf-mould, and dried cow-dung well broken up, with enough sand mixed in the whole to give porosity. They are then stood on a shelf near the glass, great care being taken in applying water, for they should not get dry at any time.

By the second week in April they are ready for repotting into 4-inch pots, the same mixture of soil, &c., being employed as before, with a small quantity of bone-meal; the plants being replaced on the shelves, and kept well shaded. By the end of the month of May the strongest plants are fit for being shifted into 6-inch pots, but the weaker ones are left in the 4-inch pots. All are placed on coal-ashes in cold frames about the end of the month of June, and shaded during sunshine and plenty of air afforded. In October the plants are taken indoors, the forwardest being situated and placed in the house above described, which is kept of an intermediate character. In a very short time the flowers appear. The more backward plants are placed in a cool house, and take the place of the earlier ones when they have done flowering, thus prolonging the season of flowering from October to May. When in flower, those which are considered worth growing again are labelled and planted out in a cold frame in May, all of the old soil being shaken from the roots; they are planted in a mixture of much the same kind as that in which they were potted. The frame is kept close till growth is renewed, when the sashes are gradually taken off, and the plants exposed to the sun during the summer months. They are potted up about the end of the month of September, great care being taken of the young roots. They are now worked along with the younger plants. I have omitted to mention that the young plants are grown in stove temperature until the time they are planted in cold frames, in June. I had the honour of being taken through the public rooms of Lees House by Lady Marjoribanks, and there saw for myself how freely these plants and cut-flowers were used for room decoration; and how well they harmonised with the antique furniture, and the paintings on the walls. It is surprising to how large an extent Cyclamens are now cultivated in private places, but it is even more surprising that few can grow these plants really well. If the unsuccessful cultivators who may chance to read these notes light upon any hints on practice likely to be of benefit, my purpose in penning them will have been secured. A. L. M.

THE APIARY.

Packing Honey.—There are several methods of packing sections of honey. Crates with springs are useful for quantities of three to four dozen sections, but if more are sent there is the risk of a spring breaking. The best plan is to get a cube sugar-box, No. 1, Tate's, and pad the bottom with shavings or hay, extending the packing-material up the two sides and ends for about 6 inches; this will prevent any injury when placed down quickly. It is to this sudden impact that is due the mischief that occurs to the capping at the top of the sections. Have these crates made each one to hold twenty-four sections, and to fit into the box one above the other; this will allow of a very thin board being placed lengthways to wedge the sections closely together. Care must be taken to place at least three layings between each crate to prevent any honey running from one crate to another if any breakage should occur. Two handles made of rope complete a good honey-case. Write on the lid "Honey, with care," and number it on the top, also on the front, so that you can at any time discover it at a glance. This will enable you to see which cases are missing. A little paint will improve the box in appearance, but they are so roughly handled that it is a waste of money.

Feeding.—Any warm day a cake of candy or a broken section can be placed on the bars, but the same must be done as quietly as possible, so that the bees may not be disturbed. *Expert.*

HOME CORRESPONDENCE.

SEASIDE PLANTING OF TREES AND SHRUBS.—I am much interested in the articles by "Experience" on this subject, especially as he is bringing to notice many comparatively unknown shrubs which very few care to introduce into their gardens, as they seem to have an idea that anything beside *Euonymus*, and a few others which may be counted on the fingers of one hand, would prove failures by the seaside. I can prove this to be utterly false, and strongly recommend intending planters to follow the advice of "Experience," and try for themselves the effect of some of the kinds suggested. There is one shrub not mentioned so far in your list, and that is *Cupressus Lambertiana*. If the true variety can be got, there is no handsomer tall-growing shrub for seaside planting, as specimens in this town will show. There seems a great difference of opinion among growers about this variety. Many, I believe, supply *Cupressus macrocarpa* for it, and say it is the same; but if the true variety be once seen, no one can be misled, for *C. Lambertiana* has a distinctly horizontal growth, quite different from the upright growth of *C. macrocarpa*. They are both grown in quantity by a nurseryman near here, and I am told that *C. Lambertiana* is rather difficult to raise, and grafting has to be resorted to. *C. macrocarpa* can be very easily raised from seeds. A. Cameron, Revoca, Eastbourne.

COE'S GOLDEN DROP.—On p. 12, Mr. Temple enquires if Coe's Golden Drop and other sorts of Plums succeed in this neighbourhood. In our collection of over fifty sorts (including most of the new ones), Coe's is still one of the very best. We never tried it as a standard, but upon walls, with both east and western aspects, it is one of the most reliable croppers. The flavour of fruits from the west walls is much the best, owing no doubt to the extra heat of the afternoon sun. As to the keeping qualities of this Plum, it certainly does hang upon the trees much longer than most sorts, but I think it should be said that the fruits may be preserved fresh for six weeks after gathering rather than six months. Other good late Plums that do well on the walls here are Grand Duke, Monarch, Belle de Septembre, and one or two seedlings, which generally keep up a supply into November. Only the freer-bearing sorts should be planted as standards, although in favourable seasons they all crop freely enough when they have been properly attended to as regards root-lifting, watering, &c. There is nothing to equal the Victoria as a sure cropper but Early Prolific, Czar, Mitchellson's Monarch, Gisborne, and Bradley's King Damson, all do well as standards, and never fail to ripen their fruit. C. Webster, Gordon Castle Gardens, N.B.

SEEDS OF CONIFERS.—In reply to the enquiry made in last issue of the *Gardeners' Chronicle*, by Mr. S. J. Westlake, I may inform him that should he fail to obtain the quantities of Conifer-seeds in this country, he may procure them from Johannes Rofu, a nurseryman at Skoofrökontorset, near Copenhagen. *Globe Trotter.*

UP-TO-DATE POTATO.—Almost everyone is interested in the Potato, whether our interest consists in looking at it from a dietetic or horticultural point of view. I have no desire to intervene in the discussion between Mr. Harrison Weir and Mr. D. T. Fish in their respective support of yellow and white-fleshed Potatoes. I should like to remark, however, that Up-to-Date is not absolutely perfect as a disease-resister. I live in a district where this and other Potatoes are very largely grown, and this year disease exists rather largely in Up-to-Date in several farms and gardens. It is also a bad keeper in pits if damp should enter. Its great cropping qualities lead it to be largely grown; but some farmers who have discarded Maincrop for it, appear to regret having done so this season. The

last issue of the *Gardeners' Chronicle* (January 13) shows that the average price of Dunbar Maincrop is 10s. above that of Up-to-Dates from the same district. The inference is obvious. *S. Arnott, Carsethorm, Dumfries, N.B.*

THE NEWTON WONDER APPLE.—In the issue of January 13 there is a letter from Mr. T. Turton, gardener, Sherborne, Dorset, on the merits of the Newton Wonder Apple as a keeper. I should like to ask Mr. Turton if his fruit was stored in a high temperature, or frosted before being stored, it being an unusual thing for the fruit to get spotted. I have kept the fruit till September, and should be much obliged to Mr. Turton for particulars as to his mode of storing, through the medium of the *Gardeners' Chronicle*. This correspondence may induce others to afford information in regard to storing long-keeping fruit. I may say that I was the raiser of Newton Wonder Apple, and I am quite convinced after trials against other so-called long keepers that it is the best in the country, and I know now at the present time of families that will have no other in for dessert while they can get this variety. And to show you it is a keeper, I will send you the name and address of one buyer who never touches his fruit till March, and he would to-day pay a good sum down to ensure having next season's crop, as his customers are so eager to get hold of such a splendid all-round Apple as this has proved to be, as anyone who has had it once always asks for it again, and will have no other, and it commands a good price in this neighbourhood. *W. Taylor, King's Newton, near Derby.*

PLUMOSE AND BARREN FERNS.—With reference to Mr. A. Hemaley's remarks on the barrenness of plumose forms of Ferns (January 13, p. 28), he is perfectly correct in saying that "there is no accounting for the vagaries and eccentricities of Ferns," and amongst such vagaries there is always the possibility of a truly plumose form reverting so far as to bear spores. All the plumose forms are necessarily sports from fertile forms; and hence, however constant they may be, must inherit the spore-bearing capacity. Among our British plumes, most, even of the more foliaceous, are more or less fertile; but one of the *Athyria*—*A. f.-f. p. Barnesii*—is reputed to be perfectly barren. I have examined many robust plants, and with one exception, invariably failed to find a trace of spores; the exception occurred in my own collection. I divided a plant into several crowns, and the following season one of the crowns produced a complete series of extremely fertile fronds, the sori being so dense as to cover the under-surfaces with a thick brown confluent mass. As all the divisions were planted in the same frame, I am utterly unable to account for this sterility; and since the following year I could not find the plants, I was forced to the belief that the reversion was only temporary. *P. v. cambricum* on the Welsh *Poly-pody* is, I believe, invariably barren in all the true forms found. A plant at Kew so labelled was recently pointed out to me as fertile, but it was *P. v. pulcherrimum*, a much-divided and superficially similar form, but which is not plumose, lacking the thin-papery texture, a case which I mention merely as showing how mistakes may arise, on the *per contra* side of the argument. The true *crispum* Hart's-tongues are also apparently constantly barren, but there are numerous well-frilled and even papery types which bear spores in irregularly distributed masses, even the finely fimbriated ones of ultra-plumose looking character doing the same thing. Some of the finest and densest plumose *Polyatichums* are reputedly barren, but grown hard in the open they are sparsely fertile, and even under glass I have forced and raised plants from quite isolated sporangia, only detectable with a strong lens. *P. ang. pl. Patzii*, a wild find, and certainly true plumose, is invariably barren with me and most growers; but a plant at Carnforth which I saw some years ago, had here and there a sorus, and showed spores under the microscope, though I failed to obtain prothalli from them. Other reputedly barren Ferns, such as *Asp. t. incisum* and *P. sculeatum pulcherrimum*, are also reported on good authority to have swerved now and again from their usually strict adherence to barrenness. Hence, I am strongly inclined to think that even *As. Farleyense* might do the same, especially if plants of it were subjected to varied conditions which would tend to harden or toughen its delicate fronds, the delicacy of which, and consequent increased beauty, is usually the sole aim of

the grower. *Ad. c. v. imbricatum* does not rank with the ordinary barren plumose, since it produces bulbils on the sites of the sori, as does also *Ad. c. v. daphnites*, as figured by me in one of your issues a year or two ago. In most of the plumose *Athyria*, however, the same thing occurs, but sporangia, as a rule, are associated with the bulbils, and contain perfect spores; further investigation may consequently show *Ad. c. v. imbricatum* to do the same. Naturally, where the fertility only gets the length of isolated sporangia, extremely careful inspection is needed to detect it, and possibly if such care were devoted to pinnules of *Ad. Farleyense* which presented any slight indication, the search might now and then be successful. *C. T. Druery, F.L.S., V.M.H.*

SEEDLING ADIANTUM FARLEYENSE.—I have read with much interest the correspondence of Mr. Sandford and Mr. Hemaley on this subject. I am surprised that the former should accept as proof positive of the ability of *A. Farleyense* to produce fertile fronds the solitary supposed instance he refers to. It is a well-known fact that *A. Farleyense* can be best propagated from minute portions of the rhizome, and young plants thus produced from old plants, denuded of their fronds, present in a remarkable degree the appearance of Ferns raised from spores. Whilst at the Barton Nursery of Mr. W. B. Smale, Torquay, I surprised more than one old hand by inviting them to come and see a batch of seedling *A. Farleyense*. On one occasion I was well-nigh deceived myself by the appearance of a young plant of the above, having all the appearance of a seedling, growing in a potful of *Begonia Gloire de Lorraine* cuttings, in a house far removed from the fernery. On recollecting, however, that the soil in which the cuttings were inserted was the refuse from a panful of *A. Farleyense* propagated from portions of the rhizome, I was quite satisfied that this supposed seedling did not owe its origin to a genuine fertile frond. *Ed. J. Love, Topsham Road, Exeter.*

— I have never attempted to raise any plants from spores of this variety. Mr. Hemaley says that it is Mr. Masters' variety, of which I have no doubt, as the frond figured in the *Gardeners' Chronicle* of January 21, 1888, is a true specimen of the variety that I have. I cannot understand your not being able to find any spores, as the edge of the pinna is turned over to the under-side; and on turning this back, I have no trouble in finding spores in quantity. I may be at Worthing this week, when I will take some specimens direct to Mr. Hemaley, which no doubt he will report to you. *E. Sandford, Bognor.*

DISSEVERED CROPS.—The planting season being now on, it may be profitable to consider what can be done towards arresting the spread of plant diseases and pests by a judicious practice of splitting up a given crop into two or three sections, and planting each section as far apart from the others as the limits of the garden will allow. Crops all the world over have suffered all the more severely from the scourges that affect them because large areas, in which plant touches plant, have been open to their attacks by close contagion, without a single barrier formed by a different kind of crop, or break of any kind. It is not possible to arrange crops, or portions of crops, within the circumscribed limits of a garden so that every scourge would be confined to the small radius of the spot from whence they originated; but the gardener, who seeks to extend the season of every crop by sowing seeds at different periods, and by planting perennial crops in warmer and cooler parts of the garden, has every opportunity of splitting up given crops for the purpose under notice, without interfering in any way with the extension of their seasons. The Asparagus-beetle, the Cabbage-gall weevil, and "clubroot" caused by alime fungus; the Strawberry "leaf-spot," thrips, and various, but not all, mildews, are a few of the instances that have come under my notice of scourges which spread rapidly from plant to plant, and which have been checked and confined to the places where they originated, although similar host plants have been growing in other parts of the garden free from any of these troubles. I would suggest that in every case where rules of rotation, water-supply, and convenience of cultivation admit, no two crops of the same kind be grown side by side; that permanent crops should be so split up as to lessen the risk of total loss, in cases where the plants are particularly

liable to diseases and pests; and that bush fruits which usually occupy an area to themselves, be so arranged that the one sort would intercept the spread of any disease or pest of the other. I view with apprehension the prevailing practice of erecting large ranges of glass-houses for Tomato-culture by market growers, without any division that would separate one house from another in cases of an outbreak of one or more of the infectious diseases to which the Tomato has shown peculiar susceptibilities. Such houses may be perfect from a cultural point of view, but they provide no safeguard against contagion—an important point to consider when a large area is covered. *Geo. B. Mallett.* [We have often called attention to this risk. *Ed.*]

A WEIGHTY TESTIMONY TO THE MERITS OF GOLDEN DROP PLUM.—Were it not absolutely true that good wine needs no bush, the columns of the *Gardeners' Chronicle* would have been crowded with such as that borne by my old and able friend Mr. Temple, of Carron, N.B., as to the bearing and quality of this fine Plum. But Mr. Temple, whom his friends old and new are always glad to read and listen to, represents seven counties and two countries, and possesses a rich, mellow, and successful experience, testifies to this Plum doing exceptionally well in various places and aspects, especially on north walls. It speaks volumes as to the hardiness and fertility of this fine Plum that Mr. Temple should match the Golden Drop without against the Victoria in those qualities in which the latter especially excels. No doubt surface, rooting is a great element in intensified fertility in this and other Plums, and in most of our fruits. Supplies of Golden Drops in private gardens through the month of November would prove a boon for late shooting parties, and probably, in the case of Mr. Temple and many others, they prove so luscious and popular, that few or none were left to finish the old or furnish fruits for several months in the new year. Still, I can assure all concerned that by following the simple instructions given, and growing a fine lot to start with, most of your readers may enjoy this finest of all Plums from nine to twelve months. *D. T. F.*

FRUITING OF EUONYMUS.—In answer to your correspondent, J. E. Tonkin, as to the abundance of berries on the *Euonymus*, there is no doubt that it was owing to the last extraordinary hot summer. There are in this district great quantities of berries, especially on plants that are growing against walls. There were in 1893 and 1896 a good many berries, but never to the same extent as at the present time. The past summer was most favourable to the ripening of the fruits of *Ampelopsis Veitchii*, an occurrence which I have only noticed once before within the last ten years. I have enclosed a few berries which you will see have perfect seeds in them. *E. Sandford, Bognor.*

— Probably the almost tropical heat of the last two summers has had much to do with the fruiting of the *Euonymus* in Mr. Tonkin's garden. In a neighbouring garden, a variegated form of *E. japonicus* trained against a wall, produced last season for the first time panicles of fruit; the bright scarlet arils of the seeds contrasted finely with the variegated foliage. Our native *Euonymus europaeus* has been more heavily laden than usual with fruit. This is a much-neglected species, it being a valuable subject for planting in and around woods, for it will thrive and fruit freely in a shady position and in poor soil. Its height in a wild state is usually about 6 feet, but given generous treatment it will soon attain a height of from 15 to 20 feet. The Spindle, or Pincushion-tree, as it is sometimes called, is of easy propagation; this may be effected by layering, cuttings, or seeds. A Pomegranate planted in these gardens in 1831 has for many years flowered more or less freely, according to the season; last year it produced its first and only fruit, which it perfected, and was of very fair flavour. In July this tree flowered in great profusion, having four flowers at the extremities of the strongest shoots. In south Cornwall the out-of-door *Camellia* bushes were last autumn laden with fruit. The sunny side of the fruit being of a reddish colour rendered them very attractive. *A. C. Bartlett, Pencarrow, Bodmin.*

— The paragraph dealing with this matter in last week's issue of the *Gardeners' Chronicle* was of interest to me, as a few years ago

I visited a small seaport about $3\frac{1}{2}$ miles from Redruth, on the north coast of Cornwall, where I was surprised to see the fruiting *Euonymus* Mr. Tonkin alludes to. When I returned to Redruth I looked all about, but I could not find a bush bearing a fruit. Every year since, I have made it my business to go to the seaside place named to ascertain if the fruiting was an annual occurrence, and to my surprise I found fruits in abundance, whilst inland the species is entirely fruitless. The *Euonymus* grows vigorously on the Cornish coast in company with *Privet*. After a gale the latter will be found deprived of all its foliage, whilst the former seems to be not any the worse for the storm. Evidently these plants have a liking for the sea coast, and the mild climate enables their flowers to expand and become fertilised freely. *An Old Kewite, Redruth.*

ODONTOGLOSSUM CRISPUM MOORTEBEEKI-ENSE.—In reply to your favour re *Odontoglossum*, *Gardeners' Chronicle*, Dec. 9, 1899, p. 431, fig. 136, there has been a mistake. The name should be *O. Lindenii*; and to make and set matters right I should like a note inserted in the *Gardeners' Chronicle* correcting the name. Please let me know that this will be done, and oblige, A. Warburton, *Vine House, Haslingden, Jan. 11, 1900.*

THE HATFIELD CURE FOR SPIDER.—I saw this method of sulphur fumigating some years ago in the very extensive and most successful Rose-forcing establishment of Mr. John Dunlop, Toronto. I think it was in the month of March when I walked through a house with him some 300 or 400 feet long, which was being fumed at the time. The vaporised sulphur was only just mildly unpleasant, and to the best of my recollection there were not more than three lamps at work. These being shifted in sections of perhaps about 10 yards apart along the pathway of the house when sufficient vapour had been emitted at any one point. The Roses in this house were in all stages of growth, from those with the tenderest leaves and shoots to mature wood with flowers thereon. Mr. Dunlop used it as a preventative and exterminator of mildew, and considered it the most effective remedy for this pest. *A. Ingram.*

I have read with much interest the correspondence through these columns on the cures for red-spider. I think that too much cannot be said or written on the subject, as it is the worst enemy the gardener has to deal with; and it is to be hoped that anyone who has a cure will make it known. What are the effects of burning sulphur (not merely evaporating) in theinery when the Vines are at rest? *T. A.* [This is not safe, the sulphur injuring the buds. *Ed.*]

SHRUBS FAVOURED BY BIRDS WHEN NESTING.—In reply to Mr. Lynch's enquiry respecting favourite shrubs and climbers for birds to build in, I beg to submit the following for his perusal, namely:—*Laurustinus*, *Azara integrifolia* and *A. microphylla*, *Eleagnus reflexus*, and other species; *Smilax tamnoides*, *Berberis stenophylla* and *B. Darwinii*, *Laurus nobilis*, *Myrsine africana*, *Lonicera gigantea*, *L. japonica aurea*, *Crataegus pyracantha*, *C. p. Lelandi*, *Cotoneaster microphylla*, *Myrtus communis*, *M. lineata*, *Ceanothus dentatus*, *C. Gloire de Versailles*, *Physianthus albens*, *Camellia japonica*, and *Euonymus japonicus aurea*. The above-mentioned are all adapted for nesting, and at Abbotsbury, where the birds are fostered always, and fed in the winter, they rest in them all very freely, especially if the bushes and climbers are allowed to grow naturally, and not trained in too flat and thin. I admit that most of the species mentioned have at this place the advantage of age, and they are all quite hardy, having withstood 20° of frost, excepting the *Physianthus*, and I could thoroughly recommend the others, especially for planting against a warm wall. *Joseph Benbow, Abbotsbury.*

LATE PEARS.—It was exceedingly kind on Mr. Woodward's part to bring a few Pears and a dish of hail-injured Apples all the way from Barham Court on the 9th inst., and thus to save the Fruit Committee at the Drill Hall from an absolutely blank meeting. The remarkable thing about the Apples, *Reinette du Canada*, was that though so injured and cut into by hail-stones that the fissures in them were an inch long and half-an-inch deep, yet no decay had followed. Possibly something was due to the well-known dry flesh of the variety. In any case, the exhibit was very interesting. But

the late Pears shown, *Passé Crassane* and *Doyenné de Alençon*, both quite old varieties, indeed, were gathered from wall-trees twenty years' planted on a west aspect, were remarkable for their unusual size and fine development, hence the Cultural Commendation awarded. But Mr. Woodward holds that late Pears particularly need special attention, and each winter he strips off the top soil from over the roots of the trees, puts on a good dressing of half-decayed animal manure, and replaces the soil. Then, towards the autumn, when the fruit is swelling, he gives the trees liberal waterings, as then they specially need such aid. Still further, as the fruits enlarge, each one is securely tied to the branch from which it hangs by a piece of soft string fastened to the stem, as such assistance greatly relieves the strain on the stem when maturity approaches. Thus the fruits are allowed to hang so long as they can safely. Each fruit is protected from birds, not by fancy aids, but by pieces of round card about $3\frac{1}{2}$ in. over. These pieces have holes punched in their centres, and a slit is cut from this hole to the outer edge in each case. Then, when fixed over the Pear, the slit is opened, passed over the stem, and then allowed to close, the centre hole holding the stem. These cards are effectual protectors, not only from birds, but also from hail. Mr. Woodward speaks in high terms of them from his wide experience. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

JANUARY 9.—Present: Dr. M. T. Masters, in the chair; Dr. H. Müller, Mr. Michael, Mr. E. im Thurn, C.M.G., and Rev. G. Henslow, Hon. Sec.

Horse-radish Attacked by Rhizoglyphus.—Some roots of this, as also of the Lily of the Valley, attacked by this mite, were received from Mr. Abbey, of Avery Hill, Etcham, who forwarded a long list of plants likewise attacked. Mr. Michael observed that it is a subterranean species, and that although it prefers bulbs, it is very injurious to many—indeed, most other plants with fleshy roots, though it may not thrive equally well upon them. As a remedy, Dr. Müller suggested lime and sugar or treacle, as being better and stronger than lime-water, as well as more persistent in its action. Mr. Michael also observed that heat, as in boiling water, was destructive, but the mite resisted chemicals to a remarkable degree. With regard to the life history, it passes through several stages, commencing with the egg; this gives rise to a hexapod larva, then to the nymph, a very active octopod. After a new change of skin in a large number of cases, but not in all, there emerges—with-out any discoverable cause—a being totally unlike the preceding, formerly known as *Hypopus*, having been thought to be a quite different genus. This has a soft body internally, but covered with a hard and usually chitinous integument. Its mouth organs are rudimentary, and it probably does not feed. It is provided with discs, by means of which it adheres to insects such as ants, bees, beetles, &c., and to other small moving creatures. These it utilises as means of migration, clinging to them, but without being parasitic. As soon as a suitable environment is met with, the mite changes back into the last nymphal stage, and then proceeds to pass into the adult male or female condition. It may attack plants in all stages, except that of the migratory *Hypopus*. The *Hypopus* in practically impervious to chemicals, and can endure without injury exposure to heat and drought, which would destroy the creature in any other stage.

Apples injured by Hail.—Some fruit was received from Mr. Woodward, of Barham Court, Maidstone, which had received severe injuries from hailstones. But although the skin was cut through and the flesh exposed, this had dried up and so protected the interior, which had not at all decayed. The storm occurred on July 19, 1899. Mr. Michael observed that when birds plunged their beaks into Apples through thirst, the injured spots usually resulted in decay.

ROYAL CALEDONIAN HORTICULTURAL.

JANUARY 10.—The annual general meeting was held on the afternoon of the above date in Dowell's Rooms, Edinburgh. This is one of the oldest horticultural societies in the kingdom, and has rendered very distinguished services to horticulture through the greater part of the century. It has two great shows in the year, the spring and autumn, both of which have done much to stimulate the love of horticulture among all classes of society, and they are so well supported by horticulturists as to strain to the utmost the ample resources of the Waverley Market. Mr. Buchanan of Penicuik occupied the chair. The secretary, Mr. P. Murray Thomson, read the report of the council, which regretted that neither at the spring nor the autumn shows was the attendance of the public such as the council desired and hoped for.

We can add our personal testimony that the exhibits at both shows were so numerous that considerable difficulty was found in placing them, and especially at the autumn display. The quality of the exhibits keeps pace with their increasing number.

Lord Lothian was unanimously re-elected President of the society, which was first instituted in 1809. Mr. D. F. Laird was appointed Vice-President by twelve votes, as against five given to the Earl of Moray. The following were chosen as Councillors: Messrs. George Mackinnon, Maasie (Dickson & Co.), Bryden, Innerleithen; and James Morrison, Archerfield. During the past year the Royal Caledonian Horticultural Society had lost twenty-one members by death, including Mr. M. Dunn and Mr. W. M. Welsh, to whose work and memory a feeling tribute was paid. *D. T. F.*

EDINBURGH BOTANICAL.

JANUARY 11.—A meeting of the members took place on the above date at their rooms, 5, St. Andrew Square, Edinburgh, under the presidency of the Rev. D. PAUL, the President of the Society.

Dr. William Craig read the report of a three days' excursion to Kirkby Lonsdale, Yorkshire, of the Scottish Alpine Botanical Club. Commencing with a description of the character and formation of the various hills, he proceeded to give an account of the plants found upon them. Amid the more notable among these were the popular garden plants *Lily of the Valley*, *Solomon's Seal*, and other garden plants, here growing quite wild. These and similar plants were also found on other mountains, such as Tarleton Fell and Hutton Roof. The very rare *Ribes alpinus* was also found on Sedburgh, in company with *Primula farinosa*, and *Genista tinctoria*. Mr. Craig's paper was richly illustrated with lantern-slides. In conclusion, he stated that the Society was founded in 1870, and gave a list of the principal plants that had been collected since that period. There was also exhibited an interesting collection of specimens collected during last year's excursion.

Mr. J. A. Terras, B.Sc., also communicated a paper, amply illustrated, on the "Lenticels of *Solanum dulcamara*."

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JANUARY 11.—RICHARD ASHWORTH, Esq., Newchurch (gr. Mr. Pidsley), exhibited the rare *Cypripedium venustum* var. *Measuresianum*, the "albino" of the type, and was awarded a First-class Certificate for same; also a very nice form of *Cypripedium insignis Sanderianum*, which has been previously dealt with by the Committee.

E. STANLEY CLARK, Esq., Wrexham (gr. Mr. Edwards), showed *Cypripedium insignis* "Stanley Clark," the chief peculiarity of which was a kind of fusion of the spots on the dorsal sepal into almost a complete mass, similar to that which is typical of *C. Boxallii*.

O. O. WHOLEY, Esq., Bridge Hall, Bury (gr. Mr. Rogers), staged a group of well-grown *Cypripediums*, amongst which was a fine form of *O. x Lathamianum aureum giganteum*, a name that somewhat overwhelmed the plant; *O. insignis Berryanum* was the best plant in the collection, it has a fine dorsal sepal of intense depth and fairly broad, while the markings are large and distinct (Award of Merit).

T. BAXTER, Esq., Morecambe (gr. Mr. Roberts), staged a handsome little group of Orchids, principally *Odontoglossums*. *Dendrobium heterocarpum*, also shown in this collection was very fine, being in a 14-inch pan, and having seventy or eighty pseudo-bulbs, about twenty-five of which were in full bloom (Cultural Certificate).

A very fine form of *Odontoglossum Wilckeanum* was staged under the name of *O. prinopetalum*, which the Committee corrected, and an Award of Merit was voted to the variety.

O. x Loochristiense was shown in flower, and was of better form than than exhibited at a previous meeting, it proves to be a very worthy acquisition to a popular class of plants; no further description of this is necessary than to say that it is an *O. x excellens*, with *O. x crispum* for a parent, instead of *O. Pescatorei* (First-class Certificate).

O. x crispum-Harryanum was exhibited from the same collection, and proved of much interest; at first sight this plant seemed to be a form of a very rare natural hybrid, viz. *O. x Wattianum*, and showed strongly the supposed parents of that Orchid, being of a yellow ground work, heavily spotted with brown markings, this colour, it appears, developed with the age of the flower. Two other examples of this hybrid, shown by Messrs. BACKHOUSE & SON, of York, had a whitish groundwork and brownish-red markings. The two exhibitors were awarded First-class honours for their plants. A Silver Medal was awarded to Mr. BAXTER's group.

W. G. GROVES, Esq., Windermere (gr. Mr. Robertshaw), obtained an Award of Merit for a very good form of *Cypripedium x Swinburnei magnificum*.

J. LEEHMAN, Esq., Heaton Mersey (gr. Mr. Edge), had a few plants, amongst which were *Odontoglossum crispum* var. *Papilion*; the varietal name is not quite descriptive, but the variety was good, and an Award of Merit was given. *O. x Adriane* var. *ornatum*, from the same collection, was awarded a First-class Certificate; it belongs to that very handsome section of natural hybrids between *O. crispum* and *O. Hunne-wellianum*, which cropped up a year or two ago. *Cypripedium Lawrenceanum* var. *splendens* proved to be a very striking variety, not too well shaped in its dorsal sepal, but certainly one of the richest-coloured forms extant (Award of Merit).

W. THOMPSON, Esq., Stone (gr., Mr. Stevens), showed a small group of Orchids, pretty amongst which were half-a-dozen well-flowered plants of *Masdevallia tovarensis*.

Odontoglossum Hunnewellianum var. *superbum* was voted an Award of Merit; while Cultural Certificates were awarded to *O. crispum* var. *Stella*, bearing a spike 3 feet long; and to *Lelia Gouldiana*, a fine plant, with many richly-coloured blooms.

T. STATTER, Esq., Whitefield (gr., Mr. Johnson), gained an Award of Merit for *Cypripedium* × *Leeanum* v. *Albertianum*; and a First-class Certificate for *O. Insigne*, Harefield Hall var.

Mr. JOHN RONSON showed a well-flowered *Lycaste* under the name of *L. Leichenaulti*, but which appears to be a form of *L. lanipes*, and an Award of Merit was given, subject to the name being verified.

Messrs. CHARLESWORTH & Co., Bradford, exhibited Worthington's var. of *Lelia anceps alba*, but the flower had suffered in transit.

T. W. SWINBURNE, Esq., Winchcombe, Gloucestershire, exhibited *Lelia Jongheana* in three varieties; the peculiarity of the labellum is very noticeable (Award of Merit).

E. BOSTOCK, Esq., Stafford (gr., Mr. Gill), exhibited two good *Cypripedium*s, viz., C. × "Collin" (*insigne* alba marginata × *villosum aureum*) (Award of Merit); and C. × *Lilian Greenwood* (*bellalutum* × *barbatum*), the latter of a very fine rich colour, and nicely shaped (First-class Certificate). P. W.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

THE members and friends of this prosperous Society celebrated the eleventh year of its existence at its annual dinner on Saturday, January 13. It was held at the Imperial Restaurant, Strand, there being a goodly assembly, over which M. GEOFFRAY, the French Minister in England, presided.

Among those present were M. Léon Clerc (Secretary of the French Chambre de Commerce), Mr. George Schneider (President Titulaire of the Society), Mr. George Gordon, Mr. Thomas Bevan (Chairman of the Floral Committee of the National Chrysanthemum Society), Mr. Harman Payne (Foreign Secretary of the same Society), Mr. Tucker, Mr. Gaskell, Mr. W. Howe, &c.

The first toast on the list was that of "The Queen and other members of the Royal Family," which was proposed by the Chairman, and very warmly received. Then came the health of the President of the French Republic, proposed by Mr. Harman Payne.

These were followed by "The Chairman," who, in reply, complimented the Society on its useful work, on its continued prosperity, and expressing satisfaction at the way in which it was cementing the good fellowship that existed between English and French horticulturists. He thought that nations as a rule did not know one another so well as they ought to do, and by means of such a Society as this much inter-communication of ideas arose, and could not fail to be beneficial. He concluded by asking them to drink to the "Continued Prosperity of the Society, and to the Health of its Officers."

Mr. Schneider responded, and gave details of the past year's work, which are of the most satisfactory nature, there being an increase in the membership of upwards of 100. Financially there is good cause for rejoicing, and the Society was in the position of receiving substantial support from many members of the horticultural trade in England, and others, some of whom he was pleased to see present; while he regretted that others, viz., Mr. George Nicholson, Mr. Arnold Moss, Mr. Drost, &c., were compelled through illness to be absent. He would conclude by asking them to drink the "Health of the Visitors." At this moment a tribute was paid to Mr. Schneider's interest in the young people, for whose benefit the Society was mainly started; and a testimonial, consisting of a handsome pair of porcelain vases, was handed to him in recognition of his help and assistance. Mr. Schneider suitably acknowledged the unexpected presentation.

Mr. Harman Payne replied on behalf of the visitors; and having proposed the "Health of the Absent Members," the proceedings were brought to a close.

Music and songs by the members enlivened the proceedings; and before separating, the company sang heartily the "Marseillaise" and "God Save the Queen." A collection in aid of the *Daily Telegraph* Fund for the relief of widows and orphans of British troops in South Africa realised the sum of 30s.

READING & DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

THERE was a large attendance of members at the fortnightly meeting of the Reading and District Gardeners' Mutual Improvement Association on Monday evening, the 15th inst., in the Club Room, The Old Abbey Restaurant, to hear Mr. G. HINTON, of Walmer Gardens, Reading, read his essay, which was awarded the first prize in the recent competition, "The Planting of a Garden with Hardy Fruit-trees and Bushes."

The paper gave rise to much criticism, and during an hour-and-a-quarter's interesting discussion many points upon planting, manuring, pruning, &c., were touched upon.

A hearty vote of thanks was accorded to Mr. Hinton for reading his paper; and to Messrs. Bunyard, of Maidstone, and the Hon. Secretary for a present of books to the library.

NATIONAL CHRYSANTHEMUM.

JANUARY 15.—A meeting of the executive committee was held at Carr's Restaurant on the above date. It was resolved that the annual general meeting of the members take place in accordance with the rules on Monday, February 5, at Carr's. A draft balance-sheet was submitted, which showed that the income for the year was £1093 0s. 5d.; and expenditure £76 4s. 6d., less, this sum being carried forward as a balance in hand. The balance of assets over liabilities was stated to be £225 13s. 2d., including the reserve sum of £74 11s. 2d.

A draft report of the committee was passed for presentation at the annual general meeting. It was resolved that sufficient be drawn from the current account to raise the reserve account on deposit to £100. It was resolved that for the future the meetings of the General Committee and of the Floral Committee should be held on the same day, namely, Mondays; and both committees will accordingly meet on Mondays, September 24, October 22, and November 26; the Floral Committee at 3 P.M., and the Executive Committee at 7 P.M.; and the Floral Committee will also meet on Monday, October 29, and November 12, at 3 P.M.; and on Tuesday, October 9, and Tuesday, December 4, at 1 P.M.

The judges at the various exhibitions nominated by the schedule revision sub-committee were approved, and also certain amendments to the regulations for exhibitions.

A recommendation from the schedule revision sub-committee to the effect that for the future the staging of exhibits at the shows should be carried out by a sub-committee of three, was carried on a close division.

A recommendation from the finance sub-committee, that all subscriptions be henceforth paid direct to the treasurer instead of to the general secretary, was withdrawn.

An interesting report of the visit of the deputation from the National Chrysanthemum Society to the Chrysanthemum exhibition held at Lyons in November last, was read by Mr. O. H. PAYNE. The deputation was heartily thanked, and it was ordered that the Report be published with the schedules of prizes, &c. Notice was given of amendments to certain rules which are to be proposed for adoption at the annual general meeting.

NATIONAL DAHLIA.

JANUARY 16.—The annual meeting took place at the Hotel Windsor, Mr. E. MAWLEY in the chair, there being a good attendance. The annual report commenced by a reference to the number of blooms staged at the annual exhibition. Of these, 1802 were show and fancy, 1803 Pompon, 1800 Cactus, and 816 single, making a total of 5730 blooms in all, rather under the usual averages, the decrease having been brought about through the dryness of the season. The display of Cactus blooms was magnificent, this type being very popular, and rapidly developing. A desire was expressed that extended opportunities be afforded for illustrating the decorative value of the Dahlia. After a recital of the new varieties which had been awarded Certificates of Merit, the report went on to thank the donors of special prizes; and in allusion to the membership of the Society, it was thought, seeing the wide interest taken in the Dahlia, it should be larger. The death of the late President, Mr. T. W. GIRDLESTONE, was deeply deplored; he was elected to the presidency of the Society in 1897, after having previously filled the post of Hon. Secretary for the space of nine years. In each of these offices Mr. Girdlestone devoted himself to the interests of the Society, and great things were expected as the results of his efforts in future years. The compilation of the catalogue of Dahlias exhibited by the Society was almost entirely his work, and his achievements as a raiser, cultivator, and exhibitor of single Dahlias were great.

The financial statement showed that the income of the Society from all sources, including the balance in hand of £15 3s. 9d. from the year 1890, and the contributions to provide prizes at the supplemental exhibition, amounted to £200 4s. 9d., and the entire expenditure, including the payment of all prizes awarded at the two exhibitions, left a balance of £7 10s. 2d. to be brought forward to the present year.

In moving the adoption of the report and financial statement, the Chairman remarked that the seasons of the Dahlia in the past two years were so hot and dry that there was a diminution of exhibits, and to some extent of quality. Some touching remarks were made on the death of Mr. Girdlestone. A memorial to their late President was being instituted to take the form of a specially struck medal, the cost of which would be defrayed by private subscription. In everything relating to the Dahlia it was necessary they should be abreast of the times, and this memorial would fittingly commemorate one who did so much for their favourite flower.

Mr. E. Mawley was elected president, Mr. Geo. Gordon and Mr. W. Marshall were added to the vice-presidents; Mr. Wilkins was elected Treasurer in the place of Mr. Mawley, and Mr. J. F. HUDSON was re-elected Hon. Secretary; the names of Messrs. J. Hudson, W. E. Reeve, and J. Stredwick were added to the Committee.

It was agreed that no supplemental show should be held this year, but some arrangement should be made for an exhibition of seedlings—if practicable, in connection with one of the meetings of the Royal Horticultural Society.

The list of Cactus Dahlias annually given in the schedule of prizes was revised, some new forms being added and some old ones struck out. The schedule of prizes was revised in several

particulars, and additions made, and it was agreed that a supplement to the catalogue should be prepared, and published in the schedule, doing this year by year as required.

MISCELLANEOUS SOCIETIES.

Isle of Wight.—The annual meeting of the Isle of Wight Horticultural Improvement Association was held on the 13th inst., in the Town Hall, Newport. Dr. J. GROVES presided over a large attendance of members from all parts of the Island. Twenty-two meetings and two exhibitions were held in various parts of the Island during the past year. There were six excursions made to places in and out of the Island, and a preparatory class was held for the Royal Horticultural Society's examination. There had been admitted 119 new members, and the total number on the books is now 437. Sir Charles Seely, Bart., J.P., was re-elected President for the ensuing year; Dr. J. Groves, Chairman; Mr. W. G. DENNESS, Secretary; and Mr. H. SLEEMAN, Treasurer. The proceedings were followed by a social entertainment at Warburton's Hotel.

Shirley Gardeners'.—The monthly meeting was held at the Parish Room, Shirley, Southampton, on the 15th inst., Mr. B. LADHAMS presiding. A paper was read on "Pear Culture" by Mr. W. Middlebrook, of Messrs. Veitch & Sons' nursery, Chelsea, was read by Mr. G. Miles, The Gardens, Portwood Park. The subjects dealt with were soils, sub-soils, position, planting, climate, stocks, pruning, insects, and diseases.

MARKETS.

COVENT GARDEN, JANUARY 18.

OUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

s. d. a. d.	s. d. a. d.
Arum Lilies, dozen blooms ... 14 0-18 0	Narcissus (yellow) doz bunches ... 6 0-8 0
Asparagus "Fern," bunch ... 2 0 2 6	— (double) doz. beh. 8 0-7 0
Carnations, per doz. blooms ... 2 6-5 0	— (white) doz. ... 3 0-4 0

POTATOES.

Main Crop, &c., 70s. to 90s.; Dunbar Up-to-Date, 100s.; Dunbar Main Crop, 105s. Other varieties, 65s. to 85s. John Bath, 32 & 34, Wellington Street.

REMARKS.—Trade generally is slow. Dunbar Potatoes are not in much request; good Savoy is a commanding vegetable; Cauliflowers and Broccoli are low in price. Cape fruits, according to advice to hand, are expected shortly. Plums will be the chief part of the consignment. The French Onions now being sent in bags are of very good quality.

(For remainder of Markets and Weather, see p. x.)

TRADE NOTE.

THE RHODES NURSERY, MIDDLETON. CHANGE OF PROPRIETORS.

We are informed by Mr. Alexander Hoyle, formerly gardener at Beech House, Heywood, Manchester, that he, in company with Mr. George Clarricoates of Manor House Gardens, Hallaton, Uppingham, have succeeded Mr. Isaac Simpson in the business of nurserymen, seedmen, and florists, carried on at the Rhodes Nursery, Middleton, Manchester.

ENQUIRY.

ASHBOTTIN'S DRESSING FOR FRUIT-TREES.—Will some reader of the *Gardeners' Chronicle* kindly inform B. M. & Sons where they can obtain this protective dressing?

ANSWERS TO CORRESPONDENTS.

APPLES WITH SPOTTED FLESH: T. H. The fruit is attacked by *Penicillium glaucum*, which penetrates the rind by wounds or the lenticels, causing the brown-spotting noticed, and eventually the premature destruction of the fruit. Spraying several times in the summer with the Bordeaux Mixture would keep the fruit free of fungus foes, and this one among others. Moist air in the fruit-room favours the spread of the fungus.

ASPECT AND VENTILATION OF GLASSHOUSES: W. Brown. A house at right angles to the south must be at right angles to the sun's rays at 12 noon. Surely this is clear. Bottom ventilation as recommended as a means of ventilation

is quite another matter from opening the top ventilators of a vinery, for instance, to regulate the temperature. W. W.

BOOKS: R. Owen. *An Illustrated Natural History of British Moths*, by Ed. Newman, was published by W. Tweedie, of 337, Strand, W.C., in 1869. You might meet with the work at the second-hand book shops.

BOTANIC GARDENS: A. C. Brazil—Rio Janeiro; Director, J. Barbosa Rodriguez. *British Guiana*—Berbice; Keeper, R. Hunt. Georgetown, Superintendent, G. S. Jenman. *Peru*—Jardinero Botanico, Lima; Director, M. de los Rios. *Venezuela*—Caracas, Jardin Botanico, and Museo Nacional; Director of latter, A. Ernst; Jardin Botanico de la Universidad, Director, P. H. G. Bourgois. *New Grenada*—F. Carl Lehmann, (German Consul, Popenyan; systematic collections Orchids, flora of Ecuador, Peru, Colombia, Costa Rica, Guatemala, &c. *Chile*—Santiago, Jardin Botanico; Director, Fredrico Phillipi.

CHRYSANTHEMUMS: J. A. W. You are quite right; the brown patches upon the leaves sent are the visible signs that the plants have been for some time attacked by the fungus *Puccinia Hieracii*, commonly known as the Chrysanthemum "rust" fungus. You may find an illustration of a leaf so attacked, and the fungus itself magnified, by referring to the *Gardeners' Chronicle*, October 8, 1898, p. 269. Adopt the treatment there recommended.

DOUBLE MUSHROOM: F. W. It is a case of the spawn having crept over the top of another Mushroom and vegetated there, and with the pileus (gills) uppermost. The occurrence is not rare in Mushroom-beds.—A. M. Such cases are frequent.

DISCOLOURED BLOOMS OF RICHARDIA, PRIMULA, &c.: C. H., St. Leonards. The causes of discoloration may be various, namely, fumes from the furnace, from the hot-water pipes, from factory chimneys, strong winds off the sea heavily laden with salt, ingress of frost, &c. You have set us a puzzle, and afforded no information that would assist our judgment.

GARDENERS' WAGES DURING ILLNESS: G. F. C. The usual practice is to pay full wages for a few weeks, or till it is seen that complete recovery is in sight. In the case of prolonged illness, the matter would seem to us to rest with the employer or his agent. There is no rule that applies, excepting in the case of a gardener living in a bothy, who would have the same status as a domestic.

NAME OF FRUIT: W. T. Gascoigne's Scarlet Seedling.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Subscriber. 1, *Phyllostachys aurea*; 2, *Arundinaria japonica*; 3, *Arundinaria japonica*; 4, *Arundinaria japonica* (syn. *Bambusa Metake*); 5, *Arundinaria nobilis*; 6, *Arundinaria auricoma*; 7, *Arundinaria Fortunei*.—W. Bean and G. C. Thank you for sending such good specimens. Oh, that there were more like you! 1, *Abies concolor*; 2, *Picea Khutrow*; 3, *Sequoia sempervirens* (Red Wood); 4, *Pseudotsuga Douglasii*; 5, *Picea Morinda*; 6, *Gaultheria Shallon* (extra fine).—Sam. The yellow flower is *Reinwardtia tetragyna*, illustrated in the *Gardeners' Chronicle*, December 15, 1894, p. 721. The other is probably one of the Aloe tribe, but it is impossible to say by the scrap sent.—Hartwell. A very good variety of *Cypripedium* × *Lecanum*. The other is *Rhea discolor*, commonly called *Tradescantia discolor* in gardens.

PEACH-BORDER: Old Subscriber. If the natural soil is adhesive, or the situation low, raise the border a foot or higher than the general level. Make it at the least 2 feet deep, and put in rubble-drains at right angles to the wall, 20 feet apart and 3 feet deep. Cover the rubble with sods. If you possess the material, let the border consist of pasture-loam, which should be chopped up roughly, and mixed with one-sixth its bulk of horse-droppings and 2 bushels of lime-rubble per cart load. Make it at the least 1 foot higher than its future level, and trample the loam pretty firmly if it be not wet at the time. Filling a full supply of loam, the staple-soil must be used, but it should be brought from a part of the garden not previously cropped with stone-fruits, and

it should have some fresh loam and the other substances mixed with it. We will give you the names of varieties in our next issue.

PHYLLOXERA: American Correspondent, Massachusetts. We have not seen or heard of this in English vineries for the last few years. Radical measures, familiar to you, have kept the enemy at bay. In France and Switzerland, and in most wine-growing countries, grafting on American stocks has proved most successful. Bisulphide of carbon is an inflammable liquid, which requires care in using. No matches, and needless to say, no smoking, should be allowed in its vicinity. It is injected into the soil when the Vines are at rest, by means of a special syringe, manufactured by Vermorel of Paris. The quantity used is 10 grammes, or one-third of an ounce, and this is injected into the soil to a depth of 4 to 6 inches, or deeper in the case of heavy soils. One such injection will serve for one square yard. After the injection is made and the syringe withdrawn, stamp the soil round the Vine, so that the vapour shall not escape. The bisulphide, when properly applied, kills the insect without injuring the roots, but it does not kill the eggs. If the soil is clayey, the results are not so satisfactory. We have no doubt Richards' XL All would prove very efficacious in the case of the leaf form, but in this country the leaf form was always less common than the root form, and we have had no opportunity of trying the effect of concentrated nicotine vapour. The winged form is said to appear about midsummer, but we have never seen it. If your second house is still free from the pest, put it in charge of a different set of gardeners, so that there shall be no communication "by boots" between the two. The winter egg is deposited on the roots in autumn, and hatched in spring. From May till October six generations of sexless insects are developed, varying in their character, the last formed descend to the roots in autumn. Take care to burn all affected parts so far as possible. We thank you for your good wishes, and think you must be the worthy son of a worthy sire, since the perusal of the *Gardeners' Chronicle* has become hereditary! We, however, consider the *Gardeners' Chronicle* and its supporters much too young and vigorous to be likened to the "Grand Old Man!"

TULIPS, HYACINTHS, ROMAN AND OTHER, FAILING TO GROW: A. W. The case appears identical with some bulbs sent us in December last by "C. W." and "C. H.," and we would refer you to the reply given at p. 492, December 30.

VINES AND PEACHES: J. Bean. You will be acting rightly by proceeding in the manner described. The proportion should be three-fifths loam, not much decayed in regard to its fibre; one-fifth lime-rubble or quicklime in powder, one-fifth manure, but depending rather more in this aid to growth on liquid-manure afforded when growth is most active, much manure in a Vine-border under glass being undesirable. You might afford a manurial mulch in the summer if your loam is light or sandy. Soot always does good when used in moderation; in excess, it makes the surface pasty, and prevents the ingress of air to the roots. One pint to 2 square yards is enough to afford at one dressing, and thrice during growth is sufficient. It will not be enough to give all your attention to the top of the border; but you ought to ascertain the state of the border and the roots down to the bottom, and the drainage. If the soil is found to be close in texture, and unduly wet, and the Vine-roots are destitute of the finer roots which collect nutriment, things are not satisfactory, and you will have to collect materials for a new border to be made next October or November. The drainage is a very important matter. Provided you do this, your Vines and Peach-trees may be kept in a good bearing state for many years.

"THE PRAISE OF GARDENS."

THE Praise of Gardens, an Epitome of the Literature of the Garden Art, by A. F. Sieveking, consists of two parts. The first consists of quotations from writers on gardens arranged chronologically (pp. 1 to 313), and a "Historical Epitome" (pp. 315 to 413). The author is not so much concerned with the plants cultivated as with the characters of the gardens themselves. These are readily divisible into two kinds—rectangular enclosures with numerous beds, divided by small paths, which prevailed from the earliest times to the seventeenth century; then, the more natural and varied character of park-like scenery, effected by landscape gardening, which began to supersede it, though both kinds may be combined, as they are about many of our English mansions of to-day.

The earliest historical gardens are those of Egypt, pictures of which are engraved on the walls of tombs; one from that of a military chief of the eighteenth dynasty was figured by Daubeny in his *Roman Husbandry*, and is reproduced by the present author. The "hanging gardens" of Babylon appear to have been artificially constructed on arches bearing terraces, and rising in series one above the other. Those on the small island of Isola Bella, in the Lake Maggiore, seem to be a good imitation; all the earth for the last was brought from the mainland.

The garden mentioned in the Song of Solomon is of the rectangular type, walled in, and pro-

vided with raised beds of herbs. It was into such a garden that Ahab converted Naboth's vineyard.

The Greeks had olive grounds and orchards, but no gardens that we know of, in our sense of the word.

The ancient Romans appear to have done better; for we have descriptions of gardens by Varro, Pliny, and others, both outside and within cities. Loudon, in his "History of Gardens" (in the *Cyclopædia*), gives plans of the Laurentine-villa on the Tiber, now called San Lorenzo. Pompeii has also preserved them, now restored and replanted, as shown by a photograph—an excellent example—growing in a rectangular enclosure, with pillars down the sides, trellises, pergolas, statuary and fountains, &c. In fact, it closely resembles a garden of the last century of some nobleman's establishment.

Similar gardens, but simpler, existed by the early monasteries and abbeys, though, as the Hon. Miss Amherst points out, the relics of them are now few. Their contents consisted of kitchen-herbs and medicinal drug-plants, arranged in parallel beds, each bed being, as a rule, devoted to one kind of plant.

Gardens of the Norman dynasty more resembled our orchards, as "comparatively few trees or esculent plants were known in England till even the latter centuries."

Little remains now of the old Abbey gardens; but Miss Amherst has given a charming photograph of a corner of the garden of Ashridge,* with its Box "knott" and edging, which may perhaps represent its primitive condition. Topiary work, a favourite form of ornament with the Romans, has been carried on even down to the present time.

Of Italian gardens of the sixteenth century, the author refers to, and gives an illustration of those of "St. Germain-en-Laye, built for Henry II., running down to the Seine in a series of terraces, under which were grottoes in rock and shell-work, and figures disporting themselves in the waters, were considered one of the marvels of the age."

Miss Amherst's illustration of a garden in a town, from a French MS., of the late fifteenth century, shows how the Roman plan of having a number of rectangular beds was persistently adhered to. Exactly such a garden is described by Carolus Stephanus in his little work, *De Re Hortense Libellus*, 1545, A.D.†

The best and greatest example of Tudor gardens was that of Hampton Court. "They were characterised by moats and walks, while the 'knotted' beds are railed with painted wands, or surrounded with low fences of trellis-work. Mounts at the corners, galleries, dials, cabinets of verdure, columns, and pyramids of marble, topiarian work and fish-ponds, complete the details."

"As an introduction to the Elizabethan garden we must return to Italy. . . . The mediæval Italian gardens are founded upon the Roman villas, evolving into fortified cities or monasteries, of which many of them occupy the sites." An illustration of the Villa d'Este, Tivoli, gives an excellent idea—"The terraces, rendered necessary by the hilliness of the ground, with flights of steps leading to the different levels; the piazzas, for shade and air; avenues and plantations of Olive, Vine, and Myrtle; fountains, statuary, urns, and vases; these are the decorative elements of the later

stately architectural Italian gardens, with their fine perspectives." The illustrations of the terrace and well-house in the garden of the late Mr. Harry, of Malta, given in the *Gardeners' Chronicle*, April 12, 1890, p. 447, will show how this type of garden was imitated there.

We now reach the date of Gerard's *Herbal*, 1597, when "physic gardens" were advocated. He himself proposed that one should be made at Cambridge, "to encourage the faculty of simpling." "The *Herbal* was, so to speak, the *Catalogue Raisonné* of the physic gardens, which, on the revival of learning, were instituted one after another throughout Europe." That at Chelsea is the last, still so called, in England.

It must be borne in mind that plants were mainly cultivated for their medicinal values, real or imaginary, as well as for culinary purposes. Thus, the Cabbage, though always cultivated for food, yet was supposed in Pliny's time to have eighty-seven distinct medicinal virtues! And although plants with conspicuous flowers were grown, as Poppies, Pæonies, Marigolds, Violets, Wallflowers, &c., yet it was as much for their curative properties as for beauty, though many were used for chaplets and other decorative purposes.

"The Dutch style of laying-out gardens, introduced into England by William III. and Mary, is not unlike the French; but everything is on a smaller, almost too minute, a scale, and much care is expended upon isolated details and ornaments (often trivial), such as glass-balls, coloured sands and earth, flower-pots innumerable, and painted perspectives; and the garden is usually intersected with canals degenerating into ditches."

Hampton Court, in Queen Anne's reign, was the finest example in England of the Dutch style, of which a bird's-eye view is given, as it appeared in 1706.

With regard to the second, or natural class of gardens, it appears "the reaction in favour of them was largely assisted by the letters of the French Jesuit missionaries describing the Chinese Emperor's gardens at Peking," of which an illustration is given, "begun in 1723, pillaged during 1860."

"Landscape-gardening, as understood in the eighteenth century, may be defined as the curved *versus* the straight line . . . later on, the curved became less manageable; and finally zig-zagged to such a degree that a witty Frenchman suggested that in order to design an English or natural garden, all that was requisite was to intoxicate your gardener and follow his footsteps!" Several eminent names are associated with the new style, such as Kent, the originator of modern park scenery, and "Capability" Brown, and "Amenity" Repton. The author finally considers some foreign gardens, European and Asiatic.

The book is a very interesting one, and although the *History of Gardens in England* of Miss Amherst overlaps certain portions, this is immaterial, and the illustrations are good and apposite. *George Henslow.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM × CURTISII.

IN the year 1896, Messrs. F. Sander & Co., of St. Albans, flowered a pretty-looking hybrid between *Dendrobium* × *Cassiope* and *D. aureum*, and gave it the name at the head of this note. The same year the Right Hon. Joseph Chamberlain flowered a cross between *D.* × *Ainsworthi* var.

* *A History of Gardening in England*, p. 28.

† An account of this was given by the present writer in the *Gardeners' Chronicle*, December 11, 1897, p. 425.

and *D. × Cassiope*, which bore a remarkable resemblance to the one previously named. Indeed, it seems to be a characteristic of all *D. × Cassiope* crosses, no matter how remote the other parent, to adhere closely in form and in the arrangement of the segments to *D. Cassiope*.

A good example of *D. × Curtisii* has been sent by J. I. Holmes, Esq., Beechen Cliff, Bath. Its flowers, which are 3 inches across, have the sepals and petals arranged like *D. Cassiope*, white, with a faint primrose tint; lip similar in colour to the petals, but with a bright purple disc. Flowers fragrant, like *D. aureum*.

HEMARIA DISCOLOR.

With those who succeed in cultivating it successfully, this is an excellent white winter-flowering terrestrial Orchid, the handsome leaves rendering the plant well worthy of a place as an ornamental subject. The old form has velvety, olive-green leaves, purple beneath; the variety *Dawsoniana*, dark bronze, veined with copper-red; and the variety *Ordianus*, bright green leaves, with gold-coloured markings. All the species have much the same sort of flowers, which are borne in numbers, from ten to twenty on the upper part of the flower-stalks, which are about 9 inches to 1 foot in height. The flowers are white with a yellow centre, and each has at its base a pinkish bract almost as long as the ovary. It thrives well in an ordinary stove-house, potted in turfy-loam, with a small quantity of peat and sphagnum-moss added thereto. A fine inflorescence taken from a plant which bears four spikes is sent by H. Cary-Batten, Esq., Abbots Leigh, Bristol.

ZYGOPETALUM MYSTACINUM.

DESCRIBED in 1881 as *Kefersteinia graminea* from a plant collected by Falkenberg, and flowered by Consul Kienast-Zolly, of Zurich, it seems singular that this *Zygopetalum* should again appear in the same locality. The plant this time has flowered with Frau Ida Brandt, Brunnenhof, Riesbach, Zurich (gr., Mr. Schlecht), who kindly sends flowers and a photograph of the plant (fig. 14).

It may be designated a pretty and curious botanical species, equal in merit to the plant known in gardens as *Kefersteinia graminea*. The sepals and petals are yellowish, the lip lighter in tint and nearly white, the callus and stalk of the lip pure white with purple dots.

The species belongs to a section of leafy *Zygopetalums*, including those known as *Batemannia*, *Bollea*, and *Pescatoria*, all of which are considered difficult to cultivate here. This difficulty most likely arises from the fact that Orchid growers keep them associated with pseudo-bulbous species. They thrive best when grown together in a tolerably warm, moist house (one inner compartment opening out of another house). Plants of this section usually do well with *Miltonia Roezlii* also, and like that species, they are liable to be greatly injured by cold currents of air. J. O'B.

SOME SUSSEX FRUITS.

(Continued from p. 445, vol. xxvi.)

II. — THE QUINCE.

THE Medlar, if not a true native, is naturalised in Sussex. Not so the Quince. It has never made any pretence to belong to the British flora. If, however, there is any county in England where it would be likely to escape the boundary of the orchard, and grow in the hedgerow, that county is Sussex. The fruit nowhere else attains so large a size or so rich a flavour and hue. In the north it is unknown. The correctness of the following note will be acknowledged by those who have studied the distribution of fruits, as well as by those who have resided in different parts of England and in foreign lands. "The cultivated Apple is thought to be a variety of the Crab, and may therefore be considered a native of England. Its near relations,

the Pear and the Quince, are not natives of England, but are found wild in the southern parts of Europe. The Quince scarcely succeeds in the northern counties of England. It has not been known to ripen its fruit beyond the Tees more than twice in twenty years, though it flowers freely. The Medlar, the Walnut, and the Chestnut succeed no better." In Sussex the Medlar, the Quince, the Walnut, the Chestnut, and the Fig are all equally at home.

There is the widest possible [superficial] difference between a Quince and a Medlar. The latter is a small, rough, brown fruit, with a very large superior calyx, which persists to the end. The Quince, on the other hand, has much the appearance, in the finest fruits, of a golden Pear with a smooth rind. Its shape varies, as does that of the Pear, but one species assumes the more globose form of the Apple when properly cultivated and developed. It is a pretty sight for a stranger to gaze upon a Quince-tree when the fruit is ready for picking, but there are many people who find its peculiar and dis-

and Quyne, all of which correspond with the French Coin or Coing, a Quince. All the forms are ultimately referable to Italian Cotogna, the Latin Cotoneum, which stands for Cydonian, and so brings us to the Greek word for the Quince, namely, Cydonian Apple. Cydonia,* one of the chief cities of Crete, was one of the places where it was originally cultivated with great success, and when the Greeks saw it there, or received it from the City, they applied this name to it, just as we still call the little dried Grapes which our merchants bring from Greece, Corinth, or Currants. This custom of naming products after their place of growth or export is common enough. We have port from Oporto, while sherry and many other names tell the same story. Having traced the name back to the Greeks we may now make the early allusions to the fruit our starting point, and bring its history down to modern times. As no name for the Quince has been found in Sanskrit it is assumed that the fruit was unknown to the early Aryans. This suggests that it did not grow

FIG. 14.—ZYGOPETALUM MYSTACINUM.

tinctive scent objectionable. Just as some people never acquire a taste for the Mango or the Tomato, so there are those who cannot relish the Quince. It is curious to note the effect of false derivations. Thus in French the Quince-tree is known as the *Coignassier*, and an able writer affirms that the name was applied to it because the disagreeable odour of the fruit requires that it should be placed in a coign or corner of the orchard or garden. I called one day in November on some friends, who grow a considerable number of Quinces. As we chanced to allude to the subject, the gentleman said he would bring me some specimens. He left the room, but on returning said the cook had made them all into jelly as soon as they were brought in, because the odour filled the house unpleasantly! It would appear that Du Hamel thought the name had been coined by the French, whereas a simple reference to the form it assumes in the allied languages would instantly have shown him that the name had an origin and history quite independent of Gaul.

The history of the name is long and interesting. In Sussex it is frequently called Quintzey (perhaps because it had some supposed connection with quincy), and in old books it is spelt Quence. Earlier still we find it in English as Coin, Coine,

beyond Central Asia, although it is found wild in the woods in the northern parts of Persia, where it is known as Haivah. This may be the same word as the Russian aiva—the cultivated Quince, as distinguished from the word armud, from the Armenian armada, the wild Quince. The names which exist in Poland, Albania, and elsewhere, are evidently not imported, but belong to the languages of the people, from which we may reasonably infer that the fruit was not introduced commercially, but was known ages ago as an indigenous growth, or a fruit which had long become established in those countries.

Pliny, the verbose and gossiping author of a work on natural history, which constitutes a vast storehouse of information on all that the ancients knew about these matters, has something to say respecting the Quince, which shows its antiquity in Greece. With all gravity, he informs us that a circle is traced around the root of the tree, and the root itself is then pulled up by the left hand. If care be taken by the operator to state at the time what is the object for which the root is procured, and for whom it is required, it may be successfully

* Some writers assert that Cydonia was so named on account of its fruitfulness in Quinces, but they do not say how the Quince obtained its name.

worn as an amulet, or employed as a cure for the scrofula. One is reminded of the Mandrake, and the curious rites associated with that wonder-working plant. From Pliny also we learn that from it an oil was extracted. It was called melinum (from *Mélon*, a fruit, an Apple; the Quince being known as *Mélon cydonia*), and in order to make it choice must be made of fruit which had grown in a dry soil. For this reason Quinces, which were imported from Sicily, were most highly esteemed. The Quince-tree has twice been found figured among the frescoes of Pompeii, which indicates the knowledge the ancients possessed of it. In Pliny's time the fruit was suspended on the statues of the divinities which ornamented the bed-chambers of the rich. This custom lends colour to the statements frequently repeated by early writers, that the Quince was associated with love. It was consecrated to Venus, and looked upon by Grecian lovers as a token by which they

pungent smell, and also ripen later than the others. De Candolle remarks that, though this fruit was probably naturalised in the east of Europe before the epoch of the Trojan war, it has been little modified by cultivation, and is as hard and acid when fresh to-day as it was in the time of the ancient Greeks.

As to the distribution of the Quince, we find it wild in Northern Persia, "near the Caspian Sea, in the region to the south of the Caucasus, and in Anatolia. A few botanists have also found it apparently wild in the Crimea, and in the North of Greece; but naturalisation may be suspected even in the east of Europe, and the further we advance towards Italy, especially towards the south-west of Europe and Algeria, the more it becomes probable that the species was naturalised at an early period around villages and in hedge-rows." Though there is no Hebrew name for the Quince, the tree grows wild on Mount Taurus;

Greeks already produced the finest fruit by grafting. They employed a wild or common variety of the Quince for the stock, while the graft was taken from the superior kind, which came from Cydon. With ourselves, the Quince is raised by layers, but budding and grafting are also resorted to, and the Pear is often employed as a graft, with the Quince as stock. The fruits require great care in gathering and storing, since they are readily injured by rough handling, in spite of their apparent firmness. Wasps often attack them to such an extent that the whole crop begins to decay as soon as gathered. There are now several varieties in cultivation, the fruit in one case being shaped like a Pear, in another resembling an Apple; while the Portugal Quince, with its oblong, more juicy, and less harsh fruit, is in special request for marmalade, the pulp assuming a beautiful red or purplish tint when carefully prepared. With many people, this kind of preserve is held in the highest esteem. It should be observed that though the word marmalade is now principally used of a conserve made from Oranges, it originally related to Quinces, and came from the Portuguese, who call that fruit "Marmelo," and the tree "Marmeleiro." This name is associated with the Latin *Melimum*, sweet or Honey-Apple Quince, and the Greek word for a sweet Apple, or an Apple grafted on a Quince stock. Though the fruit is not eaten raw, it is much esteemed by many people when cooked with Apples in pies and tarts. A syrup is made from its juice, and the seeds are employed in medicine on account of the mucilage they yield. It has an emollient effect on cracked lips and inflamed parts, and is also employed by hair-dressers when making plaits and braids. The old Greek physician, Hippocrates, employed the fruit as an astringent in cases of diarrhoea. In Sussex, a further use is made of it by the careful housewife, who places the fruit among her linen, and thus imparts to the wardrobe a grateful odour, while at the same time she keeps the fruit under the best possible conditions. Gerard has much to say about the Quince, but he closes his notice with words which are very suitable to our present study. There are, he says, "many other things which, for brevity sake, I let pass." *Sussex Naturalist*.

A WONDERFUL ARGYLL-ROSE.

THE accompanying photo (fig. 15), taken during last summer, shows a wonderful display of white Argyll-Roses in the gardens of Canon Norman at Berkhamstead, Herts. The flowers are commonly produced in loose clusters of three to seven.

It would seem that two Yew-bushes were originally planted at a distance from each other of 4 to 5 feet. Two Rose-trees were also planted, the intention evidently being that they would in the course of time cover the arch.

Presumably, one Rose-tree has died, but the remaining one has sworn eternal friendship for the Yew-trees. From the first they have grown up together. The Rose utilises the Yew for its support, and hangs over it everywhere with its long trailing branches and exquisite festoons, covered with pure white blossoms, which, with the Yew's background of dark green, makes a very striking picture.

It is impossible to estimate the number of blooms during the season, but the following measurements will give some idea of the dimensions of the tree. The Yew-tree has a circumference at its base of 4 feet 8 inches, and is 28 feet high. On the south side it is 25 feet long, on the east 17 feet, and on the north 22 feet.

The Rose has a circumference of 5 feet (?) at the base; and only a little more than a foot intervenes between the bole of the Yew and the stem of the Rose. At a few inches from the base the Rose throws up eleven great stems, with an average circumference of about 8 inches. These stems spread through the Yew in every direction, on the

FIG. 15.—THE WHITE ARGYLL ROSE, GROWING IN CANON NORMAN'S GARDEN, BERKHAMSTEAD.

might express their amours. It is often affirmed that this fruit constituted the Golden Apple of the Hesperides. One species was named *Chrysomelum*, which literally means Golden Apple, and Pliny describes it as having indentations and a colour inclining to gold. He makes also certain allusions to the other species of Quince known in his day, from which we may cull the most important facts. "The fruit called by us *Cotonea*, and by the Greeks *Cydonia*, was first introduced (he says) from the Isle of Crete. These fruits bend the branches with their weight, and so tend to impede the growth of the parent tree. The varieties are numerous." Next to the Golden Apple he puts "the one that is known as the Italian Quince, which is of a paler complexion, and has a most exquisite smell." Probably it was on this account that these fruits were placed "in the ante-chambers of great men, where they receive the visits of their courtiers." The peculiar odour which is offensive to some, is exceedingly grateful to others. Pliny adds, that the Quinces of Neapolis are also held in high esteem; while the smaller varieties have a more

its distribution seems, therefore, to correspond pretty generally with that of the Medlar. It is quite naturalised on the open hill-sides near Funchal, in Madeira, particularly across the valley to the south-west of the church. The "slender, tough, flexible, twig-like branches" are much used by the Portuguese as riding-switches. The fruit is "irregularly globose, or short and thick, more or less knobbed, of an uniform golden-yellow colour; austere, hard, and inedible, with a slight taste of garlic, but very fragrant, and making a delicious marmalade, which is in particular request among the Portuguese, especially as a remedy in colds and sore-throats." Turner tells us that in his day the juice of a raw Quince was regarded as a certain antidote against deadly poison. In folklore we find that it is a favourable sign if one dream of Quinces, as a speedy deliverance from sickness and other troubles is indicated thereby. The folk-lore of the fruit is, however, usually of an erotic character, and does not bulk largely among the Anglo-Saxon race.

As for its mode of growth, we learn that the

south side to a height of 22 feet, and then branching very freely, hang over in festoons about two-thirds of the way down on that side. The Rose clothes the east side, and it is here that it is most dense, and spreads itself over the whole length of the north position; not content with this, it covers all the nearest sides and top of a wire structure of three arches which is at the north-east corner. *W. Percival Westell.*

FORESTRY.

ROTATION IN FORESTRY.

(Continued from vol. xxvi, p. 439.)

A VERY general opinion exists among planters that rotation is as necessary in forestry as in agriculture. A good deal is, however, assumed in regard to farm and garden crops that is not borne out by the facts; but in the case of forest-trees it would almost seem that rotation is of little or no consequence. I am not here speaking so much of trees succeeding trees, but of the same species of trees following each other generation after generation—probably from pre-historic times in some cases. I had lately sent me, by one of the Jarrah timber companies in Western Australia, the late Mr. Ednie Brown's report of the forests there (in connection with the business of one firm), from which it would appear that the different varieties of the Eucalyptus must have grown on the same soil from a remote period of the world's history, and that the young seedlings still keep coming up in the greatest abundance where clearings have been made, while trees of all ages are found in the same tracts of forest. In fact, the Jarrah forests appear to be unlike natural dense forests elsewhere, inasmuch as the trees are comparatively thinly distributed, and not even-aged, an enormous extent of ground having to be ransacked by the owners of lots to get trees of the right dimensions, many small poles and trees being left. To supply a greater variety of useful timber, Mr. E. Brown proposed, had he lived, to introduce quite a number of our European Firs and hardwoods to Western Australia, the timber of these species being at present imported from Europe.

It is the same in the great timbered regions of Europe. In the Hartz Mountain region they have no traditions of anything but Beech and Spruce mainly; while on the sandy plains further south it has always been Scots Fir principally, the original soil having been long buried deeply by the humus that has accumulated from the fallen leaves, and resembling the black surface-mould in America where the Pine forests have been cleared. William Black, the novelist, describes in one of his books these gloomy, dark Pine forests, under which no vegetation is seen except the dark green moss, which keeps asserting itself above the constantly augmenting deposit of Pine leaves and cones that fall from the trees.

In the case of the Spruce Fir forests of Germany an attempt is made to clear the ground of the old stools before replanting with the same species, but it occurred to the writer that the clearance was only partial, numerous roots being unavoidably left in the soil after the stools were removed, digging or trenching being out of the question. In the Beech forests the stools are left to decay. The same course of reproduction has been going on for thousands of years in the old Scots Fir forests in Scotland—Scots Fir, Birch, or Heather, growing together or succeeding each other where Nature has had her own way. The Heather disappears under the Scots Fir, but reappears again when the Firs are cleared off, no matter how long the forest has existed. On one highland estate, about which there was trouble among the heirs, much fine Scotch timber was felled, the ground being left uncared for, and in a few years the Heather was knee-deep. Indeed, the common Heather may be regarded itself as a kind of timber crop that 'goes on for ever' on the same soil.

In England there are numbers of natural old Oak woods that have continued as long as any records exist, not only producing fresh generations of trees from seed, but crops of poles of good useful size from stools until the third and fourth generation. I have often found little families of Oak poles occupying a circle of ground that had once been occupied by the original stools long since decayed, leaving only the outer ring that held the groups together.

I am of opinion that it is a matter of little consequence how often we repeat the crop so long as trees only are produced, and coarse weeds and undergrowth are kept down. But once old woods become thin some usurper invades the soil, and the common Bracken is one of the worst. I know old and thin woods where, during the past thirty years, the Bracken has advanced over the ground in a square line—pushing on and on in front, killing underwood and all other growth in its progress, and never exhausting itself, but thriving on its own *débris* till you could cut the rhizomes out in solid blocks with a spade.

It appears to me that when a wood is kept with close cover the trees themselves provide more food, on the soil, than they consume. I certainly know plantations sixty years old, and some less, in which the leaf-mould is now so deep that one could shovel it off, and in this mould, and between it and the original poor soil nearly all the fibrous roots of the trees appear to be. A spade cannot be inserted anywhere on the surface without cutting into masses of roots. Originally the ground was a miserable cliff of rocks and stones, without much soil of any sort. This is the experience also of Continental foresters. Trees want but little else than a root-hold from the soil, and what they take up in the shape of food they more than put back again, and there is always the rain from heaven, and the original soil besides, to supply their quota. *J. Simpson.*

COLONIAL NOTES.

NOVA SCOTIA.

It is pleasing when one so constantly hears grumbles about the British climate, to find some part of it held up for admiration. The climate of Southern Nova Scotia is, says the *Canadian Horticulturist*, such as to make it a favourite resort in summer from the heat of New York and Boston. "The summer fogs are very constant. . . . This condition of things explains why it is that Strawberry-growing has lately been found so remunerative, and that Roses are grown to such perfection."

GARDENING UNDER GLASS.*

(Concluded from p. 85.)

WE have now considered the fundamental principles which underlie indoor gardening, namely, the construction of houses, temperatures, shading, ventilation, water, and soils. I propose to conclude this paper with a few observations on the—

PRESENT STYLE AND TASTE IN INDOOR GARDENING.

Commercial gardening differs from æsthetic gardening, in that the end in view of each is not the same. The nurseryman and market-gardener grow to sell, and all their arrangements are distinctly utilitarian. It is from them, however, that many valuable lessons in horticultural practice may be learnt. Their object is ever to produce the best and the most by the quickest and cheapest methods. They cover large areas of land with light, generally cheap, structures, designed however to catch all the sunlight and heat possible. The internal arrangements for

the accommodation of their plants are often, apparently, of the most make-shift character, but essentially perfect for the end in view. Much of the market-grower's produce is forced—that is, grown under conditions which, whilst favourable to rapid development, are generally more or less destructive. Both in the United States and in England, the progress made in this one department of horticulture within the last half of the century has been most rapid, and where one acre was covered with glass fifty years ago, twenty are covered now. The number of large establishments devoted to the cultivation of decorative plants in pots is another striking feature of modern commercial horticulture. These are managed on the most economical methods, but in the best of them one sees abundant evidence of wise forethought, careful planning, and a knowledge of the factors essential to success. I am certain that these methods, compared with those of the ordinary garden, are controlled by a greater knowledge of and attention to important details. Whilst nothing is wasted, at the same time everything essential is provided by the up-to-date market-grower and nurseryman. True art in indoor gardening, however, does not concern him. He manufactures material; he studies only the question of supply and demand.

I made the following observations a few months ago when noticing the new department in the winter-garden at Kew: hitherto, true art in the garden has been limited to gardening in the open air, but if the cultivation of ornamental plants under glass is to continue to find favour in this country, considerable reform of means will be necessary. The eternal red flower-pot, stages, exposed hot-water pipes, and the ugly formality in arrangement, which characterise most plant-houses, are tolerated only because we have not learnt to grow plants under glass as they are grown out-of-doors. A collection of alpine plants in pots would appeal to few tastes, whereas the same plants arranged in Nature's way among stones produce an effect that is pleasing to all. Hardy shrubs or trees grown in pots or tubs would not only be unsatisfactory to look at, and costly to keep, but they would not grow into character, however great the care bestowed upon them. Yet we continue to contort, ill-treat, and starve our indoor plants by confining their roots in pots, and setting them on stages where they are often as unhappy as they look. There are, however, evidences here and there of reform in this matter, and the results are, so far, so satisfactory that all who love glass-house gardening must follow sooner or later. These new structures at Kew are examples of what is meant; the plants being set out in beds, so that one walks among them with very different feelings from those experienced in the old-fashioned, big conservatory, where tub and pot, and a huddled arrangement prevail.

The tendency is to grow too many plants in a glass-house. In a botanic garden, the collector's spirit must predominate, but even here much more selection should be practised than is usual. In the private garden, however, the first aim should be a pleasing arrangement, and this can be obtained by abolishing the stage and flower-pot, and substituting beds of soil in which the plants can be permanently placed. The difference in the first cost between this and the pot-and-stage system is as three to one.

There is a belief among gardeners that bottom-heat would be necessary for tropical plants if grown in beds; but this is quite a

* From a Paper read at the Kew Mutual Improvement Society.

mistake, as may be seen in various tropical houses at Kew, where the plants are thriving in unheated borders. Some plants cannot be easily accommodated except when grown in flower-pot or basket; but these are comparatively few.

1st, that the plants cannot be removed to less conspicuous positions when leafless or otherwise unattractive; 2nd, when planted out they are apt to rush into a luxuriance of growth, and soon become too large for their positions. A well-groomed plant should be interesting at all

be commendable rather than otherwise. Even small houses can be made picturesque by the adoption of some such natural arrangement as that in the Nepenthes-house at Kew, for instance, where not only is the general effect pleasing, but the individual plants are far more attractive than they ever could be if grown in pots or pans.

The improvement in gardening art, so marked within the last twenty years, has not yet affected the indoor department. People of taste find more pleasure and interest in the rock-garden, the herbaceous border, the shrubbery, and arboretum than among the plants in the houses, and consequently indoor gardening receives less attention than formerly was the case. This is due largely to the inartistic arrangements which characterise the ordinary conservatory, stove, or Orchid-house. By making an effort to get rid of all that is ugly in our plant-houses, and by affording to the plants treatment more suitable to their requirements, we may probably induce more to take an interest in the houses than do now. We must get out of the old rut formed in the days of our grandfathers. I believe we have all the appliances to enable us to produce much better results than we do now, if we only study them and the plants we have to grow.

CLEMATIS PRINCESS OF WALES.

THIS, though one of the older varieties, is still one of the best, being, as stated in Moore and Jackman's *The Clematis*, an exceedingly fine Clematis, remarkable for its refinement, and the substance and richness of colouring of its flowers (fig. 16). It belongs to the lanuginosa series, flowering early, and having very large flowers, some 7 inches across, of a bluish-mauve colour, with a satiny surface. It was raised in Mr. Jackman's nursery at Woking.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Morello Cherries.—As these bear on the wood made in the previous year, the method of training them is somewhat similar to that accorded the Peach. It follows, therefore, that the pruning needed is of the same nature as the Peach, with this difference, and that if branch-pruning is necessary it may be practised freely. I have never known harmful results to follow; but, on the contrary, much good, and old trees can be entirely rejuvenated by its adoption.

Spraying.—When training and nailing are completed, the trees should either be sprayed or washed with an insecticide while growth is still dormant. Spraying is the most economical method of applying insecticides, there being less waste of the insecticide. Nothing, I think, can surpass the caustic alkali solution, the use of which now is gaining ground in this country. Some are nervous about its use, but there need not be the slightest apprehension if the formula for making it be strictly adhered to, and the best of chemicals employed. It is made by taking 1 lb. each of caustic soda and crude potash (the latter can now be bought in a soluble form, 1 pint of which is equivalent to 1 lb. of the dry chemical), and place these in separate wooden buckets or tubs, pouring boiling water on them, and when dissolved mix both together, and dilute to 10 gallons. The person making this wash should be careful not to hold his head over the vessels when first pouring the water on the chemicals, as they boil violently, neither should he let any of the resulting liquid touch his hands. The solution should be applied while hot through a proper sprayer, fixed either on a syringe or at the end of a hose attached to a garden-engine. The latter is the best means for applying it where there are many trees, and a length of tube for reaching to the tops of walls and tall trees

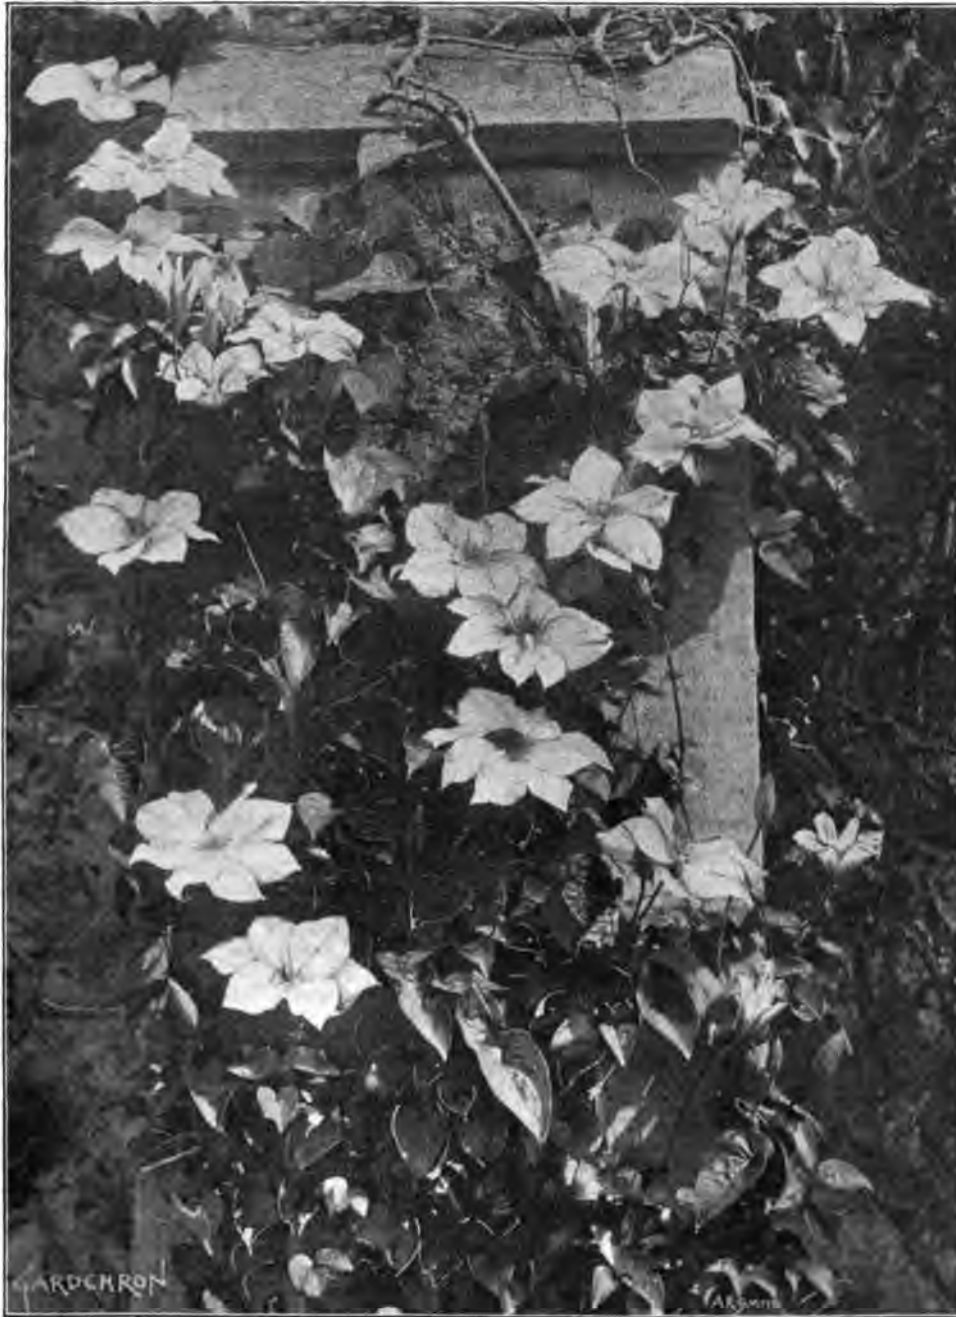

FIG. 16.—CLEMATIS PRINCESS OF WALES.

The ideal glass-house garden would be one where the plants are arranged and planted in the ground precisely as when grown in the open air, the structure over them being as light and unobtrusive as possible. Such houses would not be costly, and there is plenty of proof that they would afford far better conditions for the plants than the most carefully-designed house of the ordinary pattern.

The only possible objections to this planting-out or natural treatment or indoor plants are,

times. We do not want to dig up our Roses or other hardy shrubs because they are leafless and flowerless for some time.

With regard to the rapidity of growth, I would say that it is surely better to have a healthy, luxuriant specimen for two or three years than a miserable half-starved scrag of a plant for twenty. If a succession of plants be kept up in the propagating department, so that overgrown specimens may be rooted out and replaced, the changes thus brought about would

out in the open should also be provided. At the strength mentioned it may safely be used for Plums, Pears, Apples, and Cherries. For Apricots, Peaches, and Nectarines, dilute to 14 gals. Those who altogether object to its use may employ petroleum emulsion, or one of the many insecticides now sold, applying it according to the directions. The recipe for making petroleum emulsion having been given so often in these columns, it is unnecessary to repeat them.

Bush Apples and Pears.—After the wall-trees are pruned, these will be next to claim attention. If all summer growths on the spurs were stopped last August, the chief thing now to be done is to shorten back any pieces of wood then left of too great a length, and cut back leading shoots according to the available space. On bush trees which have reached full limit, this will mean cutting them back to three or four buds; and on others, where there is still room for extension, to one-third or one-half their length. The spurs on old trees, when they are grown too long, should be thinned in the manner advised for wall-trees. This will lead to a sacrifice of bloom buds, but the remainder will benefit by it, and the resulting produce will be all the finer. Pay particular attention to varieties which set fruit-buds on the tips of the young shoots, which should be left till next autumn, and then cut back. A few varieties prone to do this are Cornish Gilliflower, Gascoyne's Seedling, Yorkshire Beauty, Ecklinville, Tyler's Kernel, Pott's Seedling, &c. Take out boldly a few of the worst-placed or cross branches in trees that are too crowded. Trees, the shoots of which were not pinched in the summer, will stand in need of a considerable amount of pruning at this season. This winter-pruning may be avoided by stopping all growths, excepting the leaders, in the month of August. Young bushes should be so pruned, that only sufficient shoots are left to form the framework of the future tree, and no more, and all others should be spurred in. For bushes, a centre or leading branch is not necessary, and with some varieties, or such as are strong growers, it is not desirable. Each branch should have sufficient space, so that when fully developed, sunlight and air have free play among them, and each will thus in course of time become clothed with fruit-spurs from base to tip. With the aid of a few stakes and some tarred twine the branches may be drawn down, and made to assume their proper positions, if they do not do so naturally. In the course of two or three seasons these branches become rigid, and need no further attention. Espaliers and borders need precisely the same treatment with regard to cutting back to three buds all growths on spurs, and the thinning out of the latter when of undue length. Take care to leave shoots on young trees to extend them both laterally and vertically, and these should be cut back to firm and well-ripened wood.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Cool *Odontoglossums*.—The species *O. crispum*, *O. Andersonianum*, *O. Ruckerianum*, *O. Wilckeanum*, *O. Pescatorei*, *O. Halli*, *O. luteo-purpureum*, *O. triumphans*, and some others, are, at this season, developing their pseudo-bulbs, and producing flower-spikes and fresh roots, and should in consequence not be allowed to get into a state of absolute dryness. Owing to the mildness of the winter, these plants have not been subjected to too much fire-heat with its evil effects, and their present appearance gives promise of a good show of bloom. The need of but little artificial heat calls for less damping-down and affording water to the plants. Any of these plants which were not repotted or surfaced may now receive attention, or as early as the conditions of growth permit. When repotted as they should be—just previous to roots appearing at the base of the new growth—rather more than ordinary care should be taken when affording water, the roots soon entering the new materials and requiring it in some quantity. Snails and slugs, which do much harm if allowed to exist, must be sought for nightly.

***Odontoglossum Rossi*.**—This plant is usually grown in hanging baskets, and its flower-scapes are now being formed, which occurs just previous to the pseudo-bulbs reaching full dimensions and maturity, consequently a liberal supply of water will still be needed by the plant.

Odontoglossum Cervantesii* and *Erstedii having completed the growth of their pseudo-bulbs should receive water at longer intervals of time, and be allowed to remain dry for several days.

***Odontoglossum Edwardsi*.**—This species when under cultivation does not seem to make its new growth at any regular season, different plants showing diverse stages of progress at about the same date. Their season of flowering is the spring, and any plants the flower-spikes of which are in course of development, should be allowed to remain dry for a few days before affording more water. Plants which are still growing, but have not formed new roots, should be noted, and when the latter seem prominent, repotting or surfacing performed as may seem required. After the removal of decayed material, place the plant in a clean Orchid-pot, rather more than three parts filled with drainage, working in amongst the roots and packing well up to the base, a compost consisting of lumpy peat two parts, and one part of fresh sphagnum-moss. When finished, the base of the growing part should stand slightly above the rim of the pot. Be rather cautious in affording water before the roots have entered the new material, but let enough be applied as will keep the sphagnum-moss alive. A good position for the plant is one where a few degrees more heat are obtainable than the cool-house affords.

***Odontoglossums cirrhosum* and *elegans*.**—These species require more warmth than *O. crispum*, as well as much drier conditions at this season; any excess of moisture at the root or in the air being apt to bring on the decay of the tips of the leaves, if not something worse.

Odontoglossum citrosium should occupy at this season a position in the intermediate house, being either staged or suspended near the glass, and afforded water only when shrivelling in the pseudo-bulbs becomes severe. With this plant, soon after the last made pseudo-bulbs attain to full size, new growth emerges from the base, out of which, when this has progressed an inch or more, the flower-spikes protrude, and until this occurs water is almost unnecessary.

Odontoglossums grande* and *Inleayi likewise require a very small quantity of water from this date until the end of the month of May; and a very suitable place for them is found on a shelf in the intermediate-house, where there is little risk of water reaching them when damping down. Woodlice injure the roots during the resting period, and must be kept under by traps of bits of Potato, Turnips, or Carrots, made with a cavity in them, placing these on the pots, and frequently examining them for the marauders.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ilchester, Abbotsbury Castle, Dorset.

Pruning Deciduous Flowering Trees and Shrubs.—Many of these invaluable adjuncts to the flower garden will now require to be pruned, thinned, &c., and a good deal of discretion will be needed in carrying out the several operations. With the large specimens all large decayed branches should be removed close up to the sound wood with a saw, and most of the useless branches in the inner part of the crown which, if left, usually die early and rob the outer branches of light, and as a consequence vigour. Misplaced branches should be cut back to the lowermost fork or to the stem, as the case may be. All large wounds should be dressed with Stockholm-tar or slate-coloured paint. At this season Weigelas, Deutzias, Spiræas, Philadelphuses, Ribes, Forsythias, Lilacs, and others, which flower on the last year's wood, should have the coarse, flowerless shoots removed, and the weaker ones thinned in numbers. The chief pruning of such species should take place towards the end of the flowering season of each.

Roses.—Now is the season, weather permitting, for the formation of new Rose gardens, stations, beds, &c., the renovation of old beds and borders, and the digging up of old cankered and worn-out plants. In making a new rosary the position should be such that it is fully exposed to sunshine during the better part of the day, and does not possess many shady trees or large bushes to overshadow the beds. Failing these conditions, the shoots of the Roses will be immature, and flowers few and poor in quality. Low-lying and damp situations should be equally avoided for similar reasons; a

drier level, even if colder, is preferable, as by natural or artificial drainage it can be rendered warm. Assuming that the site has some natural or artificial protection, at a moderate distance from the beds on the north and east sides, and the roots of trees and shrubs have little chance of access to the Rose-beds, favourable results may be anticipated. The various Lord Penzance Briars, Gloire de Dijon, Souvenir de Madame Metral, climbing Turner's Rambler, Rosa Polyantha grandiflora, Reine Olga de Wurtemberg, Souvenir de la Malmaison, and other sturdy nearly evergreen Roses may be readily utilised as shelters, hedges, or wind guards, and they give added interest to a Rose garden.

Soils, and the Preparation of the Beds.—Provided the ground has not been in recent years under cultivation, it should be bastard-trenched, especially if the sub-soil at 2 or 3 feet rests on gravel or a porous material, keeping the best or top soil on the surface, and mixing well-decayed manure and crushed bones with the whole during the operation. Heavy loams are best suited for Roses, especially for grafted Hybrid Perpetuals and Climbing Roses, which are usually worked on the Briar stock. For Teas, and hybrids of them, lighter soils are to be preferred for such as are worked on the Manetti, or which are on their own roots. If clay is met with, it should be cleared out 3 feet deep, rubble drains laid to carry off the water to a main drain, the bottom of the excavated portion being covered with 10 inches of brick-rubble. The beds should then be filled with a compost previously obtained from pasture land, which would be less retentive in character.

Planting.—The beds should be allowed to settle before this operation is commenced, and a dry day chosen for digging out the holes. These should be 3 feet apart, and large enough to allow of the roots being laid out at full length. All broken or badly bruised roots, should be removed with a knife; and all grafted or budded plants have the scion, or the point of union of stock and graft or bud buried 2 inches below the surface. Plant carefully, and make each plant firm in the ground. The planting completed, the beds will be raised a little above the surrounding level. Bracken or straw should be twisted about each plant, never using rank stable-dung at this season; the decayed manure used in the digging being sufficient at this season. The standard Roses and the climbing varieties should be secured to stakes, &c.

Lawns and Grass Borders.—After the copious rains, rolling and some sweeping when the surface is dry will be required. Daisies, Plantains, and noxious weeds will now be easily extracted with a spud or piece of hard wood shaped like a budding-knife handle. For destroying worm-casts use a hurdle dressed out neatly and tightly with Thorn-branches on the principle of an enlarged "Scotch broom." Such a light iron hurdle may now be drawn regularly over the lawns, levelling the worm-casts, and also renovating the grass by destroying moss. After the operation use the roller.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Slugs, snails, and grubs are a great nuisance, especially during warm showery weather in spring. They harbour in ground of a damp and tenacious nature, and in crevices at the base of garden walls, and may easily be destroyed by sprinkling some gas-lime over the surface of the soil, especially between such plants as Broccoli and other late spring vegetables. Gas-lime that has been exposed to the air for a considerable time is the safest to use, and if this be pounded up and sprinkled in quantity sufficient to cover the surface it will soon be washed into the soil by the rain, and the grubs, and the eggs of the slugs destroyed. When the soil is hollow or parted from the base of the walls, lime may be put in quantity, as it will not in any way harm the roots of the trees that may be growing against them. Where the soil is of a lighter nature a liberal amount of salt may be used with the lime, and this is best put on ground that has been recently dug, when it will not only destroy slugs, but act as a stimulant to the future crops.

Forcing Asparagus.—Those who have pits heated with hot water will have no difficulty in forcing this vegetable, providing the return-pipes pass at the bottom of the pit, and boards are arranged

firmly on supports to allow about 2 feet of manure being placed upon them. A regular temperature may thus be kept, and as growth proceeds a gradual increase of heat afforded. Over the manure spread some soil of a light nature to the depth of 4 inches, and as soon as this has been warmed to a temperature of 60°, strong roots of about three years' growth should be planted therein moderately closely. Cover the crowns with about 6 inches of leaf-mould, and sprinkle the surface with water through a fine-rosed watering-pot so as to settle the mould. The pit should then be kept close till the growths commence to push, when the heat may be increased to 70°, admitting air at the same time which will improve both the colour and flavour of the heads. In gardens where there is not the convenience of a heating-apparatus, a good depth of litter and manure should be spread evenly in a cold frame up to within 12 inches of the glass, and made tolerably firm. This may then in a few days' time be covered with 4 inches of mould, and when the temperature is about 80° lay the roots upon this, and add a little fresh soil for the first few days, so that the increase in the temperature may be very gradual. The frame should be covered with mats each night, and during cold days, in order to keep the beds at an even temperature.

Carrots.—Autumn-sown Carrots of the Shorthorn kind will keep fresh and tender in the ground till they commence to grow, when they split, and become hard in the centres. It is therefore necessary to keep up a supply of fresh roots, that seed be sown now in pits. The beds should be prepared in the same manner as advised for Asparagus, with the addition of ordinary garden-soil. Sow the seeds moderately thick, in rows 6 inches apart, thinning the plants to an extent that will allow the roots to become of a moderate size. Early Nantes, French Horn, and Parisian will be found reliable varieties for this purpose.

Radishes may be forced successfully, if treated in the same manner as Carrots; but an addition of some burnt refuse should be the staple, and the surface of the bed should be brought near to the glass. Make the soil firm, and do not sow the seeds too thickly together, as they germinate freely. Cover them slightly with fine mould. French Breakfast and Wood's Early Frame are varieties that force well, and if some Early Scarlet and White Turnip-rooted be mixed when sowing, the supply will be prolonged.

Broad Beans.—There is very little, if any, advantage to be gained by sowing seeds of these in November, as those raised in boxes under glass, and afterwards planted out, pod as quickly, and are more regular in growth. The boxes selected for this purpose should be about 3 feet long, 1 foot broad, and 4 inches deep, and if these be made so that the nails may be easily drawn from one side the plants may be taken out without damage to the roots. Place some fibrous turf at the bottom, and half-fill the boxes with rather rough loam and leaf-mould. Plant the seeds about 2 inches apart, in four rows; keep the soil moist, and when the seeds have germinated they may be gradually exposed to the air, and duly hardened off for planting out. Beck's Early Green is a good dwarf, early sort, followed quickly by Early Mazagan and Green Windsor.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Vines.—The present is a good time to start a Muscat-house for an early autumn supply, as by the time the Vines get into flower the weather will be favourable for securing a good set of fruit. Examine the border, and if found dry, give a watering with a weak solution of nitrate of soda, to assist in the early production of new roots. The earlier-started houses of Hamburgs will now require regular attention in disbudding, stopping, &c. The first operation should be done in an early stage of growth, but not before it is possible to detect which are the most perfect bunches. Remove all but one from each spur, and the spurs should not be closer than 2 feet 6 inches alternately on each side of the Vine. This distance will allow for a full development of the finest foliage; and as good finish and high quality in the fruit are dependent on good stout foliage, maintained in a healthy condition to the end of the season, this is a vital point in good Grape culture, and this initial stage of development is the most important in forcing the Vine. The conditions necessary to secure a fine

spread of healthy foliage, capable of resisting insect attacks, and not crumbling into dead tissue, on the first hot day in June, are a healthy root-run, in a well-made border, kept in a steady, moist condition. Another point to aim at is, to set up a quick root-action. This should commence by the time the Vines have made 3 or 4 inches of growth. Until this occurs, anything like rapid forcing should be avoided. A steady temperature, ranging from 55° to 63° will secure short-jointed wood and foliage of good substance. Avoid too much atmospheric moisture, except on sunny days, and keep a crack of air on the top-ventilators during all weathers. Stop the shoots the second or third leaf beyond the bunch, and after the fruit is set, the shoot may again be extended a few more leaves with benefit to the root-action of the Vine, and the quality of the fruit, and also to the strengthening of the wood for next year's pruning. All late fruit now hanging should be cut and bottled, and kept in a dry room at a temperature of 50°. After removing the fruit, the house must be kept cool for a few days before pruning. After this operation the house and Vines must be carefully cleansed, but avoid removing the old bark from the Vines, except where mealy-bug has to be contended with. Any renovations or additions to the borders should be attended to without delay, so that any mutilation of the roots may have time to heal. Throw the house open, except during frosty weather, for the next six weeks.

Pines.—The active season with these will soon commence, and a slight rise of temperature, and more liberal supply of moisture at the root and in the atmosphere may be given with advantage. Plants likely to throw up fruit during the spring may be top dressed at once. Remove a few of the old leaves from the base of the plant and the old surface soil, and pack some good light fibry loam and bone-meal, with the addition of a little soot, firmly around the collars of the plant. A temperature of 70° by night and 75° by day, with a bottom heat of 80°, will suit the fruiting stock.

Succession Plants.—For the general potting of the young stock next month, the soil may be prepared at once by chopping up the necessary quantity of tough fibry-loam, removing the finer particles from it with a dust-sieve. To this may be added some soot and bone-meal, and the whole spread out in a dry shed for a few days, when it may be damped with a strong solution of sulphate of ammonia, afterwards throwing it into a rounded heap and covering with old mats until the soil is required for use. A bottom heat of 70° and top heat of 70° by day, and 60° to 65°, will keep this sturdy for the present.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

Bougardias.—Plants whose flowering is over should be afforded a period of rest, and only sufficient water to prevent flagging. About the middle of February prune to within about 2 inches of the older wood, and when growth starts, shake out and repot. If flowers are wanted in quantity, it is advisable to plant them out at the end of May on a warm border, stopping the shoots from time to time. Pay close attention to their needs in regard to water at the root; lift carefully, and pot early in the month of September. For pot culture, young plants are the best, and cuttings should be taken off with a "heel" when about 1½ inch in length, and rooted in a propagating frame in strong heat. After potting them off, remove to cooler quarters.

Ferns.—Those which have been cut over may now be divided and potted, using clean pots and an open compost, in which there is plenty of leaf-mould and sand. Lomarias, Blechnums, and some of the stronger-growing Adiantums and Pteris, require a more loamy soil. For filling small vases, &c., it is best to raise Ferns from spores, sown in autumn. Some care is required in pricking off, otherwise moss will smother the young plants. Potted in 60's, they make pretty plants, which are better furnished with fronds than old divided stools.

Seed-sowing.—Seeds of Cinerarias for autumn and winter flowering should now be sown in pans, and placed in a pit having a temperature of about 50°. Germination takes place in about ten days, when the pans should be raised as near the glass as possible, air being admitted freely, for if kept close

the seedlings soon spoil. When large enough to handle, pot off in 60's, and afford them air night and day. Primulas require more care, and germinate best in a temperature of 60° to 65°. Let the seed-pans be prepared in the usual manner, and fill to within ½ inch from the top with a compost of loam, leaf-mould (sifted fine), and peat-dust (from which fibre has been picked for Orchids, &c.), with plenty of silver-sand, leaving the surface perfectly level. Afford water with a fine rose-can, and wait three or four hours before sowing the seeds. When sown, lightly press the seeds into the soil, and cover them very slightly with some of the compost sifted finely; afford a light watering, and cover the pans with panes of glass, no more water being applied until the seedlings come up, when the pans should be placed on a shelf near the glass. Tilt the glass, and gradually harden off. These remarks apply also to Begonias, Gloxinias, Lobelias, and various small seeds, which in inexperienced hands frequently fail to germinate, and the seedsman is blamed for supplying "old seed." I am led to mention the above details "for young men," as I have been asked by seedsmen on two or three occasions what percentage of Primula-seeds had germinated, complaints having been received that none, or very few, of some stock had come up.

Grevillea robusta makes nice decorative plants in one season. Place the seeds edgewise, and start in stove-heat.

Sweet Peas may appear out of place among "plants under glass," but now that there are so many lovely varieties they are well worth growing in pots, and the plant can be obtained in flower six weeks before those sown or planted outside. Sow the seeds in 48's, and when the pots are filled with roots, shift into 24's, using good, rich soil, potting firmly, and growing on in cold pits. If the sticks are neatly put in they will be clothed from top to bottom, and scarcely seen when the plants are in flower. Early in May stand the plants outside, under a south wall. For corridors or grouping they are very suitable subjects to employ. For planting out sow now in 60's, and plant out in drills at the end of March, according to the weather.

Cannas, &c., should now be divided and potted, starting them in an early vinery or Peach-house; and *Lilium Harrisii*, and others, top-dressed with rich soil, examining the points of the stems for green-fly.

Various.—Hyacinths, Narcissus, &c., may be placed in the forcing-house for succession, and the plants in the conservatory re-arranged; Gloxinias and tuberous rooted Begonias may be shaken out of the old soil and re-potted. *Gloriosa superba* requires liberal pot-room, and tubers may be started forthwith in strong heat.

Seeds of the East Lothian and Princess Alice Stocks should be sown at once, the latter being the best white Stock grown. Plants from this sowing will flower in the months of June and July. When two true leaves are made, the seedling should be potted-off singly in 60's, taking care not to injure the tip of the root. They may be planted out at the end of April in good soil. Veitch's Perpetual is a very fine white Stock, of good branching habit, and one that continues to bloom longer than most varieties.

Miscellaneous Seeds.—*Clerodendron fallax* seeds should be sown early in stove-heat; the seedlings grow strongly, and make noble plants for conservatory-work during the autumn. *Rhodanthus Manglesii*, &c., may be sown thinly in seed-pans or boxes, the young plants being picked off, nine or ten, in 48's. *Torenia Fournieri*, a tender annual, should be treated similarly. Sow Mignonette in 48's filled with loamy soil in which lime-rubble is mixed, and thin the plants early; sow also *Calliopais*, *Phlox Drummondii*, and *Godetias*, in variety. Some of the latter are very brilliant, and they may be raised in quantity in cold pits with very little trouble; for succession, sow in quantity in pots as may be required. The seeds of most kinds of plants vegetate better when kept in the dark.

PUBLICATIONS RECEIVED.—From the United States Department of Agriculture, Division of Entomology: *Preliminary Report on the Insect Enemies of Forests in the North-West*. An account of the results gained from a reconnaissance trip made in the spring and early summer of 1899. Prepared under the direction of the entomologist by A. D. Hopkins Ph.D.—*Bullettino della R. Società Toscana di Orticultura* Dicembre 1899

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY JAN. 31 { Annual meeting of the Royal
Scottish Arboricultural Society.
FRIDAY, FEB. 2 { Nursery and Seed Trade Association,
General Meeting at 30,
Wood Street, Cheapside, at
4.30 P.M.

SALES.

MONDAY, JAN. 20.—Roses, Ornamental Plants, Hardy Bulbs, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, JAN. 31.—Japanese Lilies, Greenhouse Plants, Roses, Lily of the Valley, Spireas, Tuberoses, &c., at Protheroe & Morris' Rooms.
FRIDAY, FEB. 2.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—38°9'.

ACTUAL TEMPERATURES:—

LONDON.—January 24 (6 P.M.): Max. 54°; Min. 44°.
PROVINCES.—January 24 (6 P.M.): Max. 50°, Cromer; Min. 41°, Peterhead.

Rural Education.

THERE has recently been a demand for a system of education in our rural districts which shall not tend to alienate the children from country pursuits. In this connection it may be of interest to turn to the latest circular issued by the United States Department of Agriculture on *A German common School with a Garden*. While discussing, as is customary, what has been carried out in other countries, it might not be amiss to look for once at what has been done to encourage a love of nature in our own villages.

In the Rhine Province, where the school that Mr. C. B. SMITH describes, is situated, the law has ordained, since 1895, that during the last two years of the course, two hours' instruction each week shall be given in fruit-culture, gardening, and general farming. The majority of teachers in German schools come from the cities, and hence the greater part of the instruction in the subjects we are considering is theoretical. Here and there some especially active and wideawake teacher sees in the garden, that is usually used as a source of income and pleasure to himself, a means of practical instruction and a field for observation. To quote Mr. SMITH's words:—

"The teacher's Nature-study charts are supplemented with real flowers and fruits, grown in his own garden, and with insects, birds, bees, and low forms of life that make their homes in his hedge-row, or feed upon his choicest plants. Pupils working among these flowers, pruning trees or gathering fruit from Vines planted and tilled by themselves, may acquire an interest in Nature and husbandry which will remain with them throughout their after-life. Certainly they will acquire a practical knowledge of the ways in which fruits, flowers, and garden vegetables are planted and cared for, which will be of value to them in their future work as farmers or the owners of homes and gardens."

The particular school is at Alfter, and has 400 pupils and six teachers; the principal has taught there for thirty-two years, making horticulture one of his subjects from the first. He is thus in a position to gauge of the effect that the horticultural instruction he has imparted had upon the community at large. So far as vegetable gar-

dening goes, it is not easy to judge what influence the school has had in securing the high state of perfection that at present prevails, but the varieties of plants grown were introduced by the principal. The improvements in flower and fruit culture, however, are claimed as direct results of the school work.

The suggestions as regards the training are sent in outline to the principals of the schools by the provincial government, but the details are left to the teachers, so that the needs of their districts may be supplied. Space will not allow of us giving the draft syllabus in full, but some idea of it may be gained from the following:—

FIRST YEAR.

April and May.—Anatomy of plants, roots, and soil food.

June.—The construction and function of leaves and flowers.

July.—The soil and its improvement.

August.—Fruit culture, nursery work, grafting.

September.—Fruit utilisation (this is specially for girls).

October and November.—Fruit-tree management.

December.—Enemies of fruit-trees.

January.—Insect pests.

February.—Materials used in pottery and brick-making; table-salt.

March.—Common metals, coins.

SECOND YEAR.

April and May.—Garden work; vegetables.

June.—Vegetables continued.

July.—Field crops.

August.—Crop rotation, manuring, weeds.

September.—Injurious and useful insects and mammals.

October and November.—Harmful birds.

December.—Domestic animals.

January, February, March.—Physiology of man.

In the Alfter school, whose principal gained his own interest in rural pursuits from an academic teacher who was thoroughly in love with horticulture, the work of cultivating the half-acre of garden is done by the boys of the sixth, seventh, and eighth grades; twenty at a time carrying it out under the direction of the principal. For instance, the actual work of pruning is done by the children, but nothing may be removed until the pupil has shown the necessity and extent of the pruning suggested. The garden is intensively worked, and made a source of revenue; the same soil being used for two or three crops, and the produce sold.

The children enjoy the garden work. They collect seedlings from the woods, and graft and bud them at home, so that they soon have their own fruit-trees, and nearly all have flower-gardens or potted plants belonging to them.

The obvious remark upon all this is, that what is successful on the continent would most likely be so in this country; but has nothing of the kind been going on here, or, at least, been possible? The answer to this question is, that much has been done, and the possibilities for more still exist, though the speakers who cry most for education in rural pursuits would appear to assume the contrary. The reason may be that the direct teaching of the science of life that has been done of late years under the Technical Instruction Act and the Science and Art Department, has not affected the children of the labouring classes so much as those of the farmers and middle classes. The explanation of the desire that the former shall receive such education as shall cause them to retain an interest in the country, is that thereby the "labourer may be kept upon the land." Whether the hoped-for result would follow,

does not concern us here; it is only our aim to show that children in our village elementary schools have been interested in Nature by their teachers.

At least one County Council has been training numbers of elementary school-masters and mistresses in a way that has made something of enthusiasts of them, and has led them to give every scrap of information about the every-day work of Nature that they can to their pupils. There may be no class on botany or horticulture recognised at a school, for instance, but the object-lessons have been given on "a pot of Geraniums" or a "Currant-cutting."

There is, however, the point to consider which Mr. SMITH says the Germans are becoming aware of, and this is, that the success of any scheme depends entirely upon the individual teacher. What a few may accomplish for love, the mass cannot necessarily carry out to order. The task of the agricultural educationalist is to find the proper men for the work.

We have alluded to the Science and Art Department, and there exists its alternative syllabus of elementary biology, devised a year or two back by Professor MIALL, a very good course for intelligent country children. The writer has already called attention to the suitability of such an one for our grammar-schools; * but at the same time he must point out from personal experience that the methods required to ensure its success are very different from those usually in vogue in schools. The classes must be small; there must be plenty of material to handle; the discipline must be exceptional, for the temptations to play are increased; country rambles, systematically conducted, must be part of the curriculum; and lastly, the teacher must have his subject absolutely at his fingers' ends, and bring forward as many points as possible which will appeal to the instincts of his pupils.

[Since the foregoing was written, the question of teaching Natural History in schools has been considered by the Conference of Science Teachers, convened by the London Technical Education Board. The importance of several of the points touched upon, especially in our last paragraph, were emphasized by Prof. Miall and other speakers.]

H.H. THE DUKE OF TECK died on Sunday night at White Lodge, Richmond Park. The Duke, who was in his sixty-second year, was married in 1866 to the Princess MARY OF CAMBRIDGE, who died in 1897.

MR. CHARLES WOOD.—In our last issue we briefly alluded to the death of one of the oldest and most respected of our nurserymen. After leaving school in May, 1830, he went to the Clapton nurseries, then in possession of Mr. JOHN MACKAY. Here he remained four months, and then returned to the Woodlands, Maresfield, where he has been in harness ever since. In a letter written in October, 1897, he describes himself as in his eighty-second year, but "foud of office work."

MR. A. WARD, who has been gardener to the late Lady EMILY FOLEY, at Stoke Edith Park, near Hereford, informs us that he will now need to seek a new engagement. Mr. WARD is now writing our Hardy Fruit Garden Calendar, and his management of the gardens at Stoke Edith has been exemplary.

JOHN RUSKIN.—The decease of this great naturalist, whose ardent love of simple Nature has effected so considerable an influence upon the present generation, is a great loss. His tastes were simple and pure, and his writings tended wholly to the elevation of the mind. We have received appreciative references to Mr. RUSKIN's work, and regret that this week we are unable to use them.

* "Biology as a Branch of Education," *Westminster Review*, December, 1899.

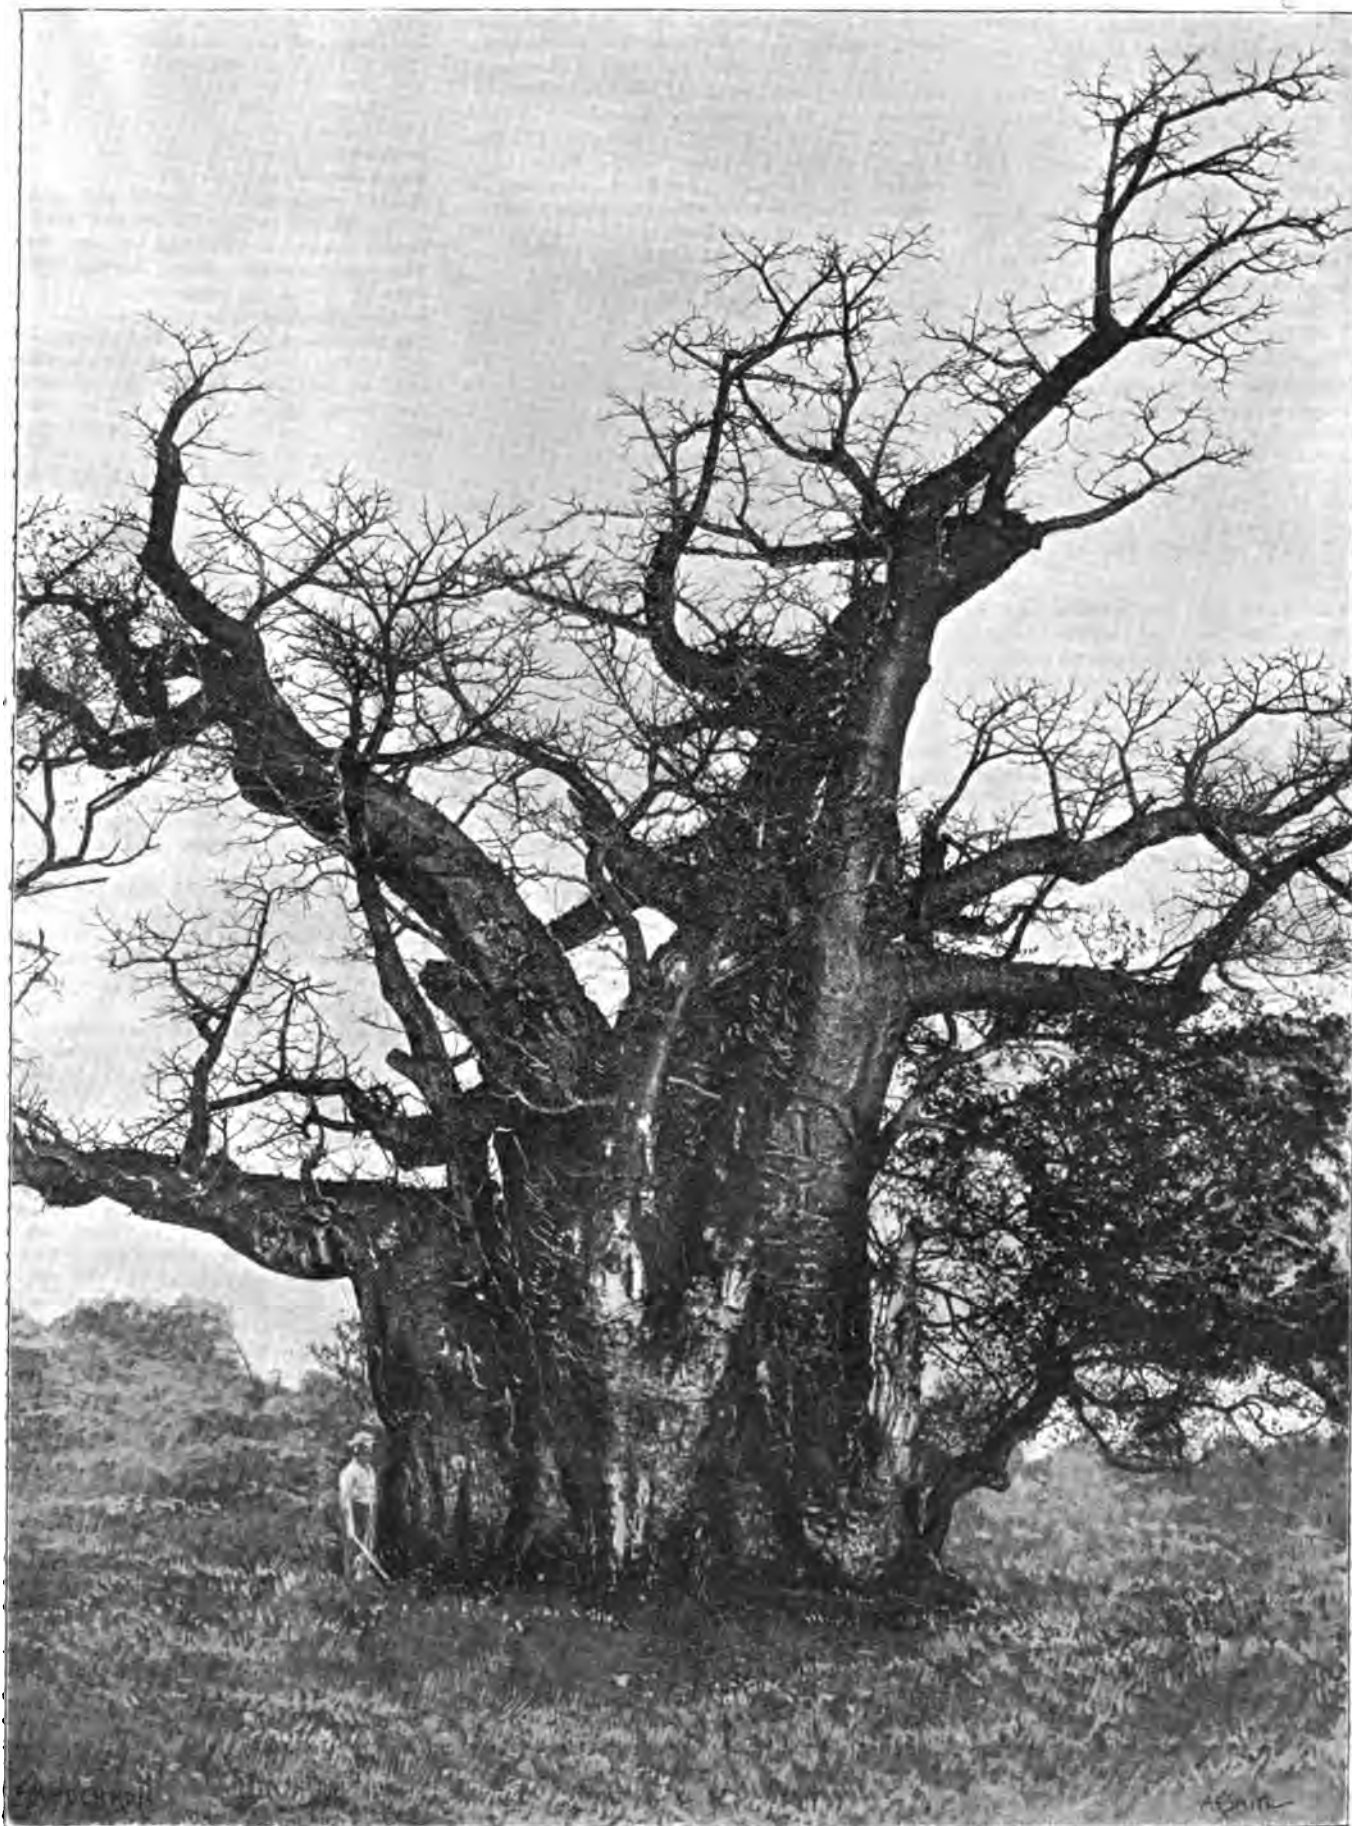

FIG. 17.—*ADANSONIA DIGITATA* GROWING AT KLEIN LETABE, TRANSVAAL, S. LAT. 24°. (SEE P. 53.)

ADANSONIA DIGITATA.—This genus, which belongs to Malvaceæ, contains a few of the veritable vegetable giants of the earth, rivalling the mammoth trees of California and Australia. The tree reaches 70 feet, but the height is not in anything like proportion to the size of the trunk, which sometimes measures 30 feet in diameter. The tree soon divides into branches, which attain to an immense size, forming dense masses, with deciduous leaves resembling those of the Horse-Chestnut. The flowers are white, solitary, and pendent on long pedicels. The specimen which we figure on p. 57, is growing at Klein Letabæ, Transvaal, in S. lat. 24°. It is known as the Baobab and Cream of Tartar tree. The photograph from which our figure is reproduced was kindly furnished by Mr. ADLAM, the superintendent of the Public Park, Johannesburg.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the lecture-hall of the Institution on Monday, Jan. 29, 1900, when the adjourned discussion on the paper read by Mr. JOHN NISBET (Colonial Fellow), entitled "Forest Management, with Suggestions for the Economic Treatment of Woodlands in the British Isles," will be resumed. The chair will be taken at 8 o'clock.

LINNEAN SOCIETY.—On the occasion of the evening meeting, to be held on Thursday, February 1, at 8 P.M., the following papers will be read:—I. "On Botanic Nomenclature," by Mr. C. B. CLARKE, M.A., F.R.S., &c. II. "On the Zoological Results of an Expedition to Mt. Roraima in British Guiana, undertaken by Messrs. F. V. McCONNELL and J. J. QUELCH," by Professor E. RAY LANKESTER, D.C.L., F.R.S., &c.

THE AGRICULTURAL DEPARTMENT IN ABERDEEN UNIVERSITY.—At a recent meeting of the Sub-committee on Experiments, there was read a letter from the Cruickshank Botanic Garden Trust, intimating the terms on which the Agricultural Department of the University might obtain the use of a portion of the new Botanic Garden at Old Aberdeen. The portion of ground consists of about half-an-acre of good soil, forming the south-east corner of the garden, and is very suitable for agricultural purposes. Last season it was cleaned and cropped with Potatoes. It appeared to the sub-committee that the whole of this ground might be advantageously used for teaching purposes, and it was resolved to hold the next meeting on the spot with a view to approving of a scheme of cropping which might be instructive to the students of the department, and also to some extent to others engaged or interested in practical agriculture.

THE AHLBOTTN'S TREE PROTECTIVE COMPOSITION.—We are enabled to inform those of our correspondents who desire to purchase this effective dressing against hares, cattle, deer, &c., that it may be obtained of NATHANIEL AHLBOTTN, 21, St. Andrew Square, Edinburgh.

ABERDEEN NATURAL HISTORY AND SCIENTIFIC SOCIETY.—Under the auspices of this Society a lecture on "Bacteria in the Service of Higher Plants," was delivered on Friday night, 19th inst., in Aberdeen University by Mr. JAMES HENDRICK, B.Sc., lecturer on agricultural chemistry in the University. The lecture was an exceedingly interesting one, and was illustrated by diagrams, experiments, &c. The lecturer traced and dealt at length with the various experiments which had been made since the beginning of the century to prove that bacteria was of service to the higher plants. At the close, Mr. FERGUSON, LL.D., of Kinmudry, moved a hearty vote of thanks, in the course of which he complimented Mr. HENDRICK on his admirable lecture. Dr. JAMES W. H. TRAIL, Professor of Botany in Aberdeen University, occupied the Chair.

ELECTION OF THE OFFICIAL STAFF OF THE FRENCH HORTICULTURAL SOCIETY.—As the result of elections recently held by the Society, the

following members now constitute the official staff, and the administrative council of the Société Nationale d'Horticulture de France: President, M. Viger; First Vice-President, M. Albert Truffaut; Vice-Presidents, MM. Ch. Baltet, Delavier, Lévêque, Vitry; General Secretary, M. Chatenay; Assistant General Secretary, M. E. Bergmann; Secretaries, MM. Sallier, Dauthenay, Ferd. Cayeux, Ph. de Vilmorin; Treasurer, M. Paul Lebœuf; Assistant Treasurer, M. Marcel; Librarian, M. Gibault; Assistant Librarian, M. Harriot. The following are the members on the council: MM. Bernard, Martinet, Grenthe, Quénat, Chemin, Thiébaud, Croux, Cappe fils, H. Defreane, Vacherot, Ausseur-Sertier, Nanot, Mussat, Maurice de Vilmorin, Ozanne, and Villard.

ROSES FOR A PENNY-IN-THE-SLOT.—M. ALBERT MAUMENÉ describes, in a recent number of *La Nature*, a new variety of the automatic distributing machine, from which Roses can be obtained. The idea originated in Germany, and the falling of ten pfennige ensures the movement of a Rose from its position behind a glass screen to a place where it can be reached and drawn out by the purchaser. The machine is stocked every day or every alternate day with fresh flowers placed on view in little tubes of water, whence they move, as said above, to a place where they can be obtained by those desiring them.

A ROMANCE OF PRIMULA OBSCURICA.—The name and nature of *Primula obconica* are utilised in a short tale in our contemporary, *The Lady's Realm*. One of the characters in the story, after contact with the plant, suffers from a "hideous eruption" that is happily but temporary in its effects. "*Primula obconica* possesses in the green cup from which the petals rise, a small and highly poisonous hair. The slightest touch of this on the hands or other surface of the skin will produce on some persons violent humours, and swelling and symptoms which otherwise resemble both erysipelas and eczema." The authoress has successfully consulted horticultural authorities for her facts, and in the guise of fiction may impart a useful caution as to the dangers of too freely handling this *Primula*, to readers not likely to learn such matters from original sources.

PALM-HOUSE IN ST. PETERSBURG.—The *Garten Flora* has an illustration of the new Palm-house erected in the St. Petersburg Botanic Garden. It is a hexagonal structure of iron and glass, 73 feet in height. It is anticipated that the noble Palms which suffered in their old home will speedily recover in their new abode.

BOTANY TEACHING.—Professor E. C. MIAL, F.R.S., recently opened a discussion at a public meeting at South Kensington on "The Teaching of Botany." He said that chemistry and physics were now making rapid strides, but the spread of botany was not what it ought to be. Botany should be encouraged because it was essential to scientific agriculture; but as taught at the present time it was no more than book-learning. What was wanted was practical and experimental teaching. Consideration ought to be given to the young who were growing up to live on the farm or in the garden, and who were practically ignorant of the processes of raising crops and rearing stock. The teaching of botany should be taken in the school course, but under the present system there were too many subjects crowded into it, with the result that nothing of any value was acquired. One of the aims should be to give a practical experimental demonstration of the way in which plants discharged the functions of nutrition and reproduction.

TOBACCO IN CANADA.—The Agricultural Department of Ontario has got well ahead with its report for the past year—a notable comparison with the collected report for 1898. Concerning Tobacco culture we find there has been a great falling off; it appears to have been successful where grown. The yield of the "weed" is esti-

mated at 2,241,562 lb., from 2,206 acres—or 1,016 lb. per acre. Of this amount the county of Essex produced 1,636,760 lb., from 1,411 acres. The production in 1898 was 10,560,590 lb., from 7,871 acres, of which the county noted contributed 7,095,970 lb., from 5,080 acres.

FRUITS IN ONTARIO.—From the just-issued Departmental Report for 1899, relating to Ontario, we learn that in most fruit-producing sections there was a considerable surplus of fruit over local demand—especially of Apples, and many heavy shipments are noted. Though the crop, on the whole, was much below the average, the quality was very variable. Pears, Plums, and Grapes were in excess of home requirements. Owing to the wholesale destruction of Peach-trees in the previous winter, the crop of this fruit was very limited. Of small fruits there was an abundance, as well as a plentiful growth of the wild varieties in the back townships. It is noted that the yield of Apples is placed at 19,126,439 bushels, or an average of 3.02 bushels per tree of bearing age. The bearing trees number 6,324,842, and the young trees 3,445,135.

"LE CHRYSANTHEME."—This journal, which is the official publication of the French National Chrysanthemum Society, is an unusually bulky one this month, and contains what may be regarded as a comprehensive account of the Chrysanthemum work carried on in France during the past season. Reports of shows in Paris, Orleans, Limoges, Ribérac, Montauban, Rouen, are given in addition to the ordinary matter concerning the Society. By far the larger portion of the number is taken up with an account of the Lyons show. This includes the full text of the speeches and papers read at the Conference, &c. The balance sheet shows that the Society starts the new year with over £80 in hand.

CHEAP TRANSIT OF FRUIT.—What was originally an experiment—the sending of small parcels of fruit by rail at a cheap rate—has proved a great success. An inquiry of the Superintendent of the Great Eastern Railway (Mr. DREYER), has elicited the information that the farm-produce traffic still continues to increase, and during 1899 the company carried 147,500 packages, against 135,860 during 1898—an increase of 11,640. Surely a most encouraging result.

PRESENTATION TO MR. WILLIAM BALCHIN, JUNR.—Advantage was taken of the recent meeting of the Brighton and Sussex Horticultural Society to present to Mr. W. BALCHIN, Junr., an illuminated address, on his retirement from the post of chairman of the committee, which he has now vacated solely on account of the pressure of business. The address bore testimony to valuable services rendered to the Society during the ten years he had discharged the duties of chairman, and was an expression of gratitude and esteem. By way of keeping Mr. BALCHIN in as close touch as possible with the governing body of the Society, he was appointed to the post of Hon. Treasurer. It is gratifying to know that the balance-sheet of the Society shows a profit on the year's working of £39 2s. 4d., and that there is a balance in the hands of the bankers of £107 7s. 3d. Mr. GEO. MILES, the Vice-chairman of the committee, was elected Chairman; and testimony was borne to the efficient services of the Secretary, Mr. THORPE.

MR. BLACKMORE AND HIS PEARS.—"F.R.H.S." writes:—Distinguished as was the position occupied in the literary world by the late R. D. BLACKMORE, it is probable that, horticulturally, he was best known as a grower of Pears. With respect to those fruits, no doubt he possessed a very wide knowledge, although it must be understood that it was largely limited to his own gardens at Teddington, not at all the best place in the kingdom for testing the merits of these pleasant fruits. The late Dr. HOGG seems to have placed a very high opinion on Mr. BLACKMORE's judgment in the matter of Pears, for the references to the distin-

guished Teddington novelist in the *Fruit Manual* are extremely frequent and effusive. But Mr. BLACKMORE, all the same, may not have had wider knowledge than have many good growers, whether gardeners or traders. Less depends on the variety grown, if all be grown on one method, than on knowledge of diverse methods of culture and treatment, such as is found in our best gardens and

great excellence. The daily papers mention that Mr. BLACKMORE rather lost than gained by Pear-culture. Well, every grower for market sale knows that having all one's eggs in one basket inevitably leads to loss. Still, very little is known as to the nature of the crops obtained, the samples secured, or the method of marketing adopted. But it is certain that several years since other gardens were

FIG. 18.—GRINDELIA PATENS.

(From specimens kindly sent us by Mr. Gumbleton.)

elsewhere. At Teddington, Pears have been chiefly grown in a very free way. Anyone passing the extensive walled-in gardens will not fail to notice the pyramidal or standard trees towering up high above the enclosures. This style, which may literally be described as free, is hardly that commonly adopted in good gardens, where restriction, with occasional root-pruning and liberal feeding, is found to accomplish wonders in the case of all Pears, and many that as free-grown trees are indifferent, by this system are made to be of

thickly planted with Pear-trees, that now show up well above the walls, apparently in luxuriant health, and their presence rather leads to the belief that Pear-growing at Teddington was not unprofitable.

PLANT PORTRAITS.

SALVIA SPLENDENS "Silverspot."—Leaves green, dotted with yellow. *Florists' Exchange*, December 30, 1899.
SANGUINARIA CANADENSIS, Blood Root.—*Mechan's Monthly*, January.

GRINDELIA PATENS.

At the commencement of last year I received from Mr. Shin, Curator of the Government Botanical Station at Berkeley, California, the seeds of four species of *Grindelia*, two of them named *G. patens* and *G. cuneifolia*, and two unnamed, and labelled respectively as *G. species*, and *G. species* from Fort Bragg. They all came up well, and in appearance and habit of growth the first three are almost similar the one to the other; but the fourth is much dwarfer, and lower growing, with smaller leaves. Only the first-named, as represented in the woodcut (fig. 18), has bloomed as yet; but as the others are growing vigorously, I hope to see them all bloom in the course of next spring or summer. I have sent plants of all four to the Royal Gardens, Kew, for identification. *G. patens* is a very pretty pale yellow Composite. *W. E. Gumbleton*.

KEW NOTES.

AMORPHOPHALLUS TITANUM.—A healthy plant of this gigantic Aroid is now growing in a stove at Kew. It will be remembered that a large example of it was for years an attraction in the T range, where ten years ago it culminated its career by producing an enormous inflorescence, which was figured in these pages. This plant was exactly ten years in growing from a small seedling to the flowering stage, after which it declined in health and finally died. Kew is indebted to Mr. C. Curtis, of Penang, for the present plant, he having succeeded in obtaining a few tubers from Sumatra, where alone this species is found. They were distributed by Messrs. F. Sander & Co., but the Kew example is said to be the only one that has survived. Judged by its present rate of growth and general vigour, we shall not have to wait another ten years to see this truly wonderful flower at Kew again.

AMOMUM ANGUSTIFOLIUM.

A plant of this, one of the large "Meligettas," or "Grains of Paradise," of tropical Africa, has been flowering for some weeks in the Water Lily-House at Kew. It resembles *Hedychium coronarium* in the characters of its leafy stems, which are 6 feet high at Kew, reaching a length of 10 to 15 feet in a wild state. In *Hedychium* the flowers are in terminal heads on the leafy stems, but in *Amomum* they are borne on separate stems, which spring direct from the rhizome. This stem in the plant under notice is as thick as a swan's quill, a foot high, clothed with closely-fitting green scales, and terminating in a head formed of dull red bracts, from amongst which spring the large handsome flowers, each 2 inches wide, the upper corolla-lobe being the largest, bright crimson, and hooded, whilst the fleshy lip is cream-yellow, and deflexed. This differs in some particulars from the figure in the *Botanical Magazine*, t. 4764, where it is called *A. Danielli*; but according to the *Flora of Tropical Africa*, the species is a somewhat variable one.

A GIGANTIC LEMON.

In the Mexican-house at Kew there is a young tree labelled *Citrus medica* var. *Limonum*, which is remarkable for the large size of its leaves and fruits, the former being 8 inches by 4 inches, and the latter 8 inches long and 6 inches in diameter. There are a pair of these fruits on the plant, and they look more like the ordinary Melon of the fruiterers' shops than any form of Lemon hitherto known. Botanically, however, it is a Lemon, and in the structure and flavour of the fruit there is no difference except that of size, these being to the ordinary Lemon what an ostrich's egg is to a hen's egg. A fruit of this large form was sent to Kew four years ago by Miss Badcock, of Taunton, in whose garden a tree of it had been growing for many years. This fruit was considered by Mr. Munro, of Covent Garden, to be too large for commercial purposes. The Kew plant is from a graft kindly supplied by Miss Badcock. *W. W.*

HOME CORRESPONDENCE.

SULPHUR FUMING.—The Hatfield cure for red-spider will be received by the less experienced of the gardening profession, or perhaps I should say, by those who have tried to check this troublesome pest in vain, as a "ray of hope." But first of all let me warn those who have read and inwardly digested Mr. Norman's cure as an effective and simple one, to be cautious. Sulphur fuming is a very old practice for the eradication of insect pests, mildew, &c.; knowing, however, that it is such an efficacious remedy, would it not be more extensively relied upon were it not for the great risks attending its use? More than one instance has come under my notice where fuming has been tried, and the outcome has been scorched foliage in one instance, when the fruit was just commencing to colour. It is needless to say the crop never finished properly, and the loss of foliage rendered successful cropping the following season very doubtful. Mr. Norman is very kind to give in detail the quantities used, but how very much circumstances alter cases. We know that our vineries are treated in various modes: for example, one gardener may grow his Vines with more air than usual, and he would not run the same risk of injury as the one who keeps his Vines in a closer atmosphere. Again, vineries vary in size, the glazing in one house is much more imperfect than in another, some varieties are capable of withstanding fuming better than others—and all these simple but important facts must be carefully considered. My advice to those who feel inclined to follow the treatment is to be extremely cautious, or the results will be very disastrous. *W. H. Clarke.*

SALE OF WEED-KILLER AND OTHER PREPARATIONS CONTAINING POISON—PHARMACEUTICAL SOCIETY *versus* WHITE, WORCESTER.—The appeal having been heard in the Queen's Bench Division of the High Court on the 16th inst., before Mr. Justice Grantham and Mr. Justice Channell, we are glad to be able to report that the Pharmaceutical Society has again been defeated, thereby establishing a case to prove that seedsmen are entitled to take orders for weed-killer, receive payment for the same, and after deducting their commission, to remit the balance to the manufacturer, without being liable under the Pharmacy Act of 1868, provided that they do not stock the preparation, but send the orders direct to the manufacturer for fulfilment. The above decision will also apply to preparations containing nicotine or other poisons. The Society has again given notice to appeal. It has been allowed to do so on certain terms, and will doubtless use every effort if again defeated to have the Act amended. We would urge seedsmen, whether dealing in these preparations or not, to use every effort to have the law so amended in their favour as to enable them to stock poisonous preparations which are required by their customers. Under certain necessary restrictions, we consider that it would be possible to influence the Government in this direction through the Board of Agriculture if only each individual member of the seed trade will do his part, by himself signing and procuring the signature of influential customers to a memorial properly prepared. We warn the trade that if they remain inactive, and careless of their own interests, that the Pharmaceutical Society will ultimately deprive them of the control of several preparations, the sale of which is their natural right. *The Boundary Chemical Coy., Ltd., Railway Arches, Luton Street, Liverpool.*

TRAPPING THE CODLIN MOTH.—In the *Gardeners' Chronicle* of the 13th inst., I note your remarks re the Codlin moth. You will be glad to hear that I have discovered an absolute cure for this pest, the efficacy of which I have fully proved. The method is simply to retain a ring of boiled linseed oil round the trunk of the tree effected as

follows:—Cut a piece of calico sufficiently long to reach around the stem or trunk of the tree, place it say two or three, or even more, feet from the ground, allowing the ends to lay one over the other; sew them together and tie it around with a cord to keep it firmly in place; sew the calico, after turning up the outer part, so as to form a little canal around the tree about an inch wide and an inch deep; fill the canal or ring with boiled linseed oil, which is rather thicker than the unboiled, and will therefore not pass through the calico. Wherever this plan is adopted, no insect will ascend the tree, and any tree much weakened by the attacks of the Codlin moth will soon regain its wonted vigour. Two separate strips of calico would be the easiest way of forming the little canal. *Edward Tangye, Knowle, Warwickshire.*

WYE COLLEGE MANURE EXPERIMENTS.—The quotation on p. 40, of manure experiments at Wye College, seems to leave something to be desired in the matter of clearness. For instance, is it to be assumed that each portion of the manures mentioned in the extract suffices for a yard of ground for one crop? or does it mean that in manuring such an area with chemicals the proportions named should be all used in combination? In the first case 6 ounces of sulphate of ammonia, nitrate of soda (why two nitrogenous manures?), and kainit should be employed. In the second case, 4 ounces of phosphates and 1 lb. of lime. Were these added we should have not less than 11 ounces of these dry manures per square yard, and would mean about 19 lb. per square rod; therefore the employment of the whole cannot well be meant. Of course, had it been stated that the nitrogen and potash were for certain crops, and the phosphates and lime for other crops, the matter might have been better understood. Possibly, my dulness is evident—possibly, something else is. At present the matter seems a little confused. *Bothered.*

APPLE NEWTON WONDER.—Replying to the note from Mr. W. Taylor, on p. 45, I can assure him that neither the time of gathering nor our method of storing the fruits of this Apple, caused them to become spotted. To prove this statement I am sending herewith two fruits of Newton Wonder, and one fruit each of the varieties Sandringham, Annie Elizabeth, Reinette du Canada, and Cox's Pomona, all of which have been grown and stored under the same conditions. The fruits of Newton Wonder are not nearly so fine as those mentioned in my note, published in *Gardeners' Chronicle* for January 13, neither are they so badly spotted as those finer fruits were. If there is anything in the local conditions that causes the spotting, it must be the soil, which is on the colt formation. I am informed that my predecessor (the late Mr. W. G. Pragnell) had also the same trouble with this Apple. I am glad to learn the name of the raiser of this Apple, which in other respects is a very fine one, and Mr. Taylor's statement as to its long-keeping qualities has made me envious. A few trees of it were planted in the orchard here (which is on grass) two years ago, and I shall await with interest their coming into bearing, in the hope that the more natural conditions under which they grow will result in the fruit they produce being better keepers. *T. Turton, Castle Gardens, Sherborne, Dorset.* [All of the specimens have been admirably preserved, and the cause of "spotting" is certainly not due to the method of storing the fruits. *Ed.*]

I have the most distinct recollection that among all the dishes of this Apple exhibited in both northern and southern sections at the Crystal Palace Royal Horticultural Society's Fruit show in 1897, only two lots were free from spotting, the others being very badly affected. If clean fruits could not be exhibited at such a show, the Apple must be a very faulty one in this respect. In 1898 the fruits shown were fewer, I think, but cleaner than in the previous year. Spotted Apples cannot be kept for any great length of time, but varieties differ in this respect considerably in different localities. In Suffolk I found that Bramley's Seedling spotted so badly that it was almost worthless, except for early use. Warner's King was liable to the same affection, but this could be corrected and the season extended by several weeks by gathering the fruits as soon as they would part from the tree, and without breaking the stalks. By this means grand coloured and clean samples were secured for the November shows. *J. C. Tallack, Shipley Hall Gardens, Derby.*

FRUITING OF EUONYMUS.—The year 1899 was remarkable for the fruiting of many shrubs besides the Euonymus, some of which I thought worth recording. The following shrubs fruited here, most of them for the first time: *Catalpa bignonioides*, *Calycanthus occidentalis*, *Cornus mas variegata*, *Wistaria multi-juga*, *Asparagus acutifolius*, *Nandina domestica*, *Clematis aethusifolia*, *C. integrifolia*, *Euonymus radicans variegata* (abundance of fruit variegated like the leaves); *Notoxylum Carmichaeliae*, and *Magnolia Lenne*. The influence of the hot dry summer will be seen in many shrubs this year; and as a commencement, my *Photinia serrulata*, at least sixty years old, is covered with flower-buds for the first time. *Henry J. Ellacombe, Bitton Vicarage, Bristol, January 20.*

Your correspondents who have written on this subject will be interested to learn that so far inland as this part of West Middlesex, both the green and variegated forms of *E. japonicus* have flowered abundantly during the past two years. Many branches being quite furnished with the small whitish blossoms. The fruits have, however, not been quite equal to the display of blossoms, though a large number of fruits were coloured well early in November. As the fruits became attractive, however, they gradually disappeared, and at the present time I do not see a solitary berry remaining. I am strong in the belief that age as well as heat has much to do with the flowering of these shrubs. *E. europæus* fruits more freely, and seedlings are quite frequent. The position of the plants is one due south, the green form acting as a screen above a low wall, the variegated kind being well sheltered from the north by the dwelling-house. Both are untrained. In a position quite near the white Jasmine, *J. officinalis* fruited rather freely a year or two since, the glossy black berries being most attractive. Where the *Euonymus* flowers at all, there should be little difficulty in obtaining its fruiting in inland places, as the flowering is somewhat early in the summer. *E. Jenkins, Hampton Hill.*

SEEDS NOT TRUE TO NAME.—I observe in the last issue of the *Gardeners' Chronicle* a report of my contention with Messrs. Howcroft & Watkins, and I dare to say that it may seem strange to some of the readers of the *Gardeners' Chronicle* that I made my claim up to £60. But 14,000 Celery plants, if well grown, cost much labour and expense. The small quantity which I have sold did not make £5, and the remainder rotted in the ground. [I have sent you a sample, which was sent to me for Clayworth's Prize, a pink variety. *Geo. Perkins, Leicester.* [The plants are those of *Celeriac*. *Ed.*]

VIOLETS FOR EXHIBITION.—It would not be unwise to incorporate in the Chrysanthemum schedules prizes for Violets. The Violet is a favourite flower, and recently we have had introduced several new and striking varieties. There are now so many shades of colour that a stand of them could be made very attractive. Prizes might be offered for bunches of blooms tastefully arranged in baskets of moss with foliage; also for plants in pots, that the habit and flowering qualities of each variety might be correctly judged; and for exhibits arranged in such a manner as to display the merits of individual blooms. I would suggest that in judging, the points should be as follows:—1st, perfume; 2nd, length and strength of flower-stalk; 3rd, size of flowers of a true Violet shape. *Edwd. Bennett, Ash Vale, Farnborough.*

ADIANTUM C. V. IMBRICATUM.—Recurring to the recent references to this Fern and its presumed non-sporiferous character, Mr. C. B. Green, my neighbour, has just brought me in pressed fronds of last season, one of which appeared profusely fertile. On examination under my microscope I found rows of fully-developed, ripe, but unburst sporangia under the indusia, and no signs of abnormality, in the shape of incipient bulbils, which I expected to find. The only unusual feature was a slightly shrivelled aspect of the sporangia, and the absence of any burst ones under the dried conditions. On crushing the material collected on the glass-slip, I managed to free a number of evidently perfect spores, and a number of imperfect ones, the undoubted presence of the former removing all question as to the, at any rate, occasional spore-bearing capacity of the variety. The facts that so many imperfect spores presented themselves, that the otherwise normal sporangia were

somewhat shrunken, and that despite the rough treatment none of them burst in the usual way, indicate a certain degree of imperfection; but, on the other hand, some of the freed spores were perfectly full-bodied and completely fashioned. Mr. Green is sowing from the frond, and I have little doubt will succeed in raising plants. *Chas. T. Drury, F.L.S., V.M.H., Acton.*

LAW NOTES.

SALE OF POISONS.

THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN v. WHITE.—In the High Court of Justice, Queen's Bench Division, Divisional Court, Royal Courts of Justice, Tuesday, January 16, 1900, before Mr. Justice Grantham and Mr. Justice Channell.

Mr. Justice Grantham: We need not trouble you, Mr. Cavanah. I have no doubt that in this case the learned County Court Judge was right. He has found as a fact that there was evidence before him—in fact, practically the evidence was almost uncontradicted as far as the defendant was concerned, that he was a florist, and knowing what was useful for the killing of weeds, he was ready to advise people where to get it. He thought also that he might assist in his own business to make a little money, and so he arranged with the people who were the sellers, and who, as it were, kept a shop for it, to tell the people who wanted to buy the stuff where to go for it, and, as he said in his evidence, "When anyone came to me, I said, 'you can either go to so-and-so, send your order direct to them, or, if you like I will take the order and send it on,'" and he was provided with billheads of this Liverpool firm for the purpose of giving receipts for money which was paid to them on their account, and he was to have a certain commission on the sale, which in this case was 25 per cent., that being so it seems to me that he was not the person who was managing the sale, he was merely the conduit-pipe to introduce one person to the other, and I do not think I can put a better example than take the case where the whole transaction is done in a shop. There is a chemist's shop kept wherever you like, and a person comes into that shop to buy some poison, there is a boy in the shop or a woman, or a girl, or any other unqualified person you like in the shop. The person wishing to have some poison, says to that person, "I want some rat-killer," or if you like to take this case, asks for weed-killer; you would hardly go to a chemist's for weed-killer, but you do very often go to a chemist's for rat-poison. You say to the boy, "I want some rat-poison." The boy says "All right; there is my master behind the counter, he manages, I will go to him and tell him what you want." Thereupon the master hears what he wants, and the master supplies the person, he being a qualified person. Can it be said that the boy who first saw the person who came into the shop and told him to go to where his master was, where the person who would deliver it, was the person who sold or who had the management of the poison? Certainly not. If that is so in a shop how can it be said that the person who does not keep it at all, who has it not on his premises, does not make it, does not deliver it, but who says I will either take your order and send it on, or you may send your order on direct yourself if you like—can it be said that he is the person who was managing the sale? I accept the judgment, as I am bound to do, on this point of Lord Selborne, applying it to this case, although it does not apply directly; but I accept his judgment, and I say, acting on that authority, the learned County Court Judge was right.

Again, there was a case quoted, very properly, in which Mr. Justice Hawkins gave judgment. I quite accept that as binding on me. It is a case of which I entirely approve, but the facts there are not the facts of this case at all; therefore, for those reasons on the evidence in this case, as the learned County Court Judge has distinctly found that he

believes the evidence of the defendant. I think the appeal must be dismissed.

Mr. Justice Channell: I am of the same opinion. I think the learned County Court Judge must be taken to have found that this defendant had not the control and management of the sale. I think the cases clearly establish that the person who has the control and management of the sale is liable, although he is not the principal seller. The cases clearly go to that; but here there was, as it seems to me, ample evidence on which the learned County Court Judge could find that this man had not the control and management of the sale. The only question in the case, which is one of law, is—What is the meaning of having the control and management of the sale? As far as I can gather from the cases, it means the person who could do or not do the things which the Act requires to be done with reference to the sale. Now here this man was merely the same as a carrier, or messenger, or something of that sort, so far as his part of the transaction is concerned, with the single exception that he got 25 per cent. out of it; and, as my brother has said, he had that 25 per cent. as a reward for recommending this substance as an effective weed-killer. It is obvious that he was employed by the principal, and that is the reason which tempts them to give him this commission. I think, upon the whole, there was ample evidence from which the learned County Court Judge could properly find as he found, that the defendant was not the person who had the control and management of the sale.

Leave to appeal was given on certain terms, namely, that the appellants undertook to pay the respondent's costs as between solicitor and client if the appeal was unsuccessful.

To enable our readers the better to form a just opinion of this case, we append extracts from the Sale of Poisons and Pharmacy Act Amendment:—

SECTION 1.—From and after December 31, 1888, it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons, or to assume or use the title "Chemist and Druggist," or Chemist, or Druggist, or Pharmacist, or Dispensing Chemist, or Druggist, in any part of Great Britain, unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act, and be registered under this Act, and conform to such regulations as to the keeping, dispensing, and selling of such poisons as may from time to time be prescribed by the Pharmaceutical Society with the consent of the Privy Council.

SECTION 15.—From and after December 31, 1888, any person who shall sell or keep an open shop for the retailing, dispensing, or compounding poisons, or who shall take, use, or exhibit, the name or title of Chemist and Druggist, or Chemist or Druggist, not being a duly registered pharmaceutical chemist, or chemist or druggist, or who shall take, use, or exhibit the name or title Pharmaceutical Chemist, Pharmacist, or Pharmacist, not being a pharmaceutical chemist, or shall fail to conform with any regulation as to the keeping or selling of poisons made in pursuance of this Act, or who shall compound any medicines of the British Pharmacopoeia except according to the formularies of the said Pharmacopoeia, shall for every such offence be liable to pay a penalty or sum of £5, and the same may be sued for, recovered, and dealt with in the manner provided by the Pharmacy Act for the recovery of penalties under that Act, but nothing in this Act contained shall prevent any person from being liable to any other penalty, damages, or punishment to which he would have been subject if this Act had not passed.

SECTION 17.—It shall be unlawful to sell any poison, either by wholesale or by retail, unless the box, bottle, vessel, wrapper, or cover in which such poison is contained be distinctly labelled with the name of the article, and the word Poison, and with the name and address of the seller of the poison, and it shall be unlawful to sell any poison of those which are in the first part of the Schedule (A) to this Act or may hereafter be added thereto under section 2 of this Act to any person unknown to the seller, unless introduced by some person known to the seller, and on every sale of any such article, the seller shall, before delivery, make or cause to be made an entry in a book to be kept for that purpose, stating, in the form set forth in Schedule (F) to this Act, the date of the sale, the name and address of the purchaser, the name and quantity of the article sold, and the purpose for which it is stated by the purchaser to be required, to which entry the signature of the purchaser and of the person, if any, who introduced him shall be affixed; and any person selling poison otherwise than is herein provided shall, upon a summary conviction before two justices of the peace in England, or the sheriff in Scotland, be liable to a penalty not exceeding £5 for the first offence, and to a penalty not exceeding £10 for the second or any subsequent offence, and for the purposes of this section the person on who e

behalf any sale is made by any apprentice or servant shall be deemed to be the seller; but the provisions of this section which are solely applicable to poisons in the first part of the Schedule (A) to this Act, or which require that the label shall contain the name and address of the seller, shall not apply to articles to be exported from Great Britain by wholesale dealers nor to sales by wholesale to retail dealers in the ordinary course of wholesale dealing.

SOCIETIES.

ROYAL HORTICULTURAL.

JANUARY 23.—The meeting held in the Drill Hall, James Street, Westminster, was, as regarded the exhibits, a comparatively small one, and was but little visited by the public. The chief items consisted of a collection of *Ferns*, small, admirably grown plants; a group of *Cyclamens*, another of *Primula sinensis* in new colours, and a quantity of miscellaneous Orchids. Fruit was conspicuous by its absence in anything like quantity, and comprised continental varieties of the Apple, contributed by Messrs. G. BUNYARD & Co., of Maidstone.

In the afternoon a lecture was given by Mr. Geo. Bunyard, V.M.H., the subject being "The Neglect of Flowering-shrubs in our Gardens." The beautiful effects to be obtained from such plants have been frequently urged in our own pages; and Mr. Bunyard's lecture deserved the attention accorded it by the audience.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. C. T. Drury, H. B. May, R. Dean, J. H. Pitt, J. Hudson, C. R. Fielder, G. Gordon, J. W. Barr, C. Shea, R. J. Cutbush, E. T. Cook, C. Blick, G. Paul, and J. Fraser.

A small group of Ferns growing in pots and baskets, was shown by Messrs. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton. The plants were examples of good cultivation, though none was of large size. Of such are not frequently met with we may mention *Pteris straminea*, a species with fronds of a refreshing bright green tint and erect growth; *Adiantum Collii*, having fronds of a light green tint, and sparse habit; *Pellaea rotundifolia*, *Gymnogramma dohrydunense*, an effective "golden Fern"; *Pteris Victorice*, *Notholaena sinuata*, *Adiantum dolabriforme*, *Asplenium ornatum*, A. Belangeri, a very graceful species; the dwarf-spreading *Hemionitis palmata*, several variegated forms of *Pteris*, *Lastrea lepida*, *L. aristata variegata*, &c. An award of a Silver Flora Medal was made.

Messrs. HUGH LOW & CO., Bush Hill, Enfield nurseries, staged a small group of *Cyclamen latifolium* and others, including "Bush Hill Pioneer," of a rose-purple colour, effective and true; and Bush Hill Pioneer, the white form of the crested *Papilio*, or Butterfly strain, likewise effective; and lastly, C. *Papilio* in variety in white, and half-a-dozen different tints of pink, purple, and also bi-coloured were noted. An award of a Silver Bankian Medal was made.

Messrs. H. CANNELL & SONS, Swanley, Kent, had an exhibit of nice fresh-looking Chinese *Primulas*, consisting of "The Sirdar," a large carmine-coloured flower; "Kensington Queen," a choice white; "Surprise," a capital purplish-crimson; "My Favourite," a pleasing shade of pink; "H. Cannell," of deep crimson; "Luther alba," a small, white flower, with a yellowish-green centre; "Miss Doris," another fine white variety; "Swanley Blue," &c. The plants were mostly grown in small 48's. Some bigger plants included "Lady White," a very fine white; a brilliantly-tinted, semi-double red; "Duchess of Fife," a grand pink flower, &c. An award of a Silver Flora Medal was made.

Messrs. J. VITCH & SONS, The Royal Exotic Nurseries, Chelsea, had their usual welcome boxful of cut blooms, *Rhododendron Javanico-jasminiflorum* hybrids, *Sousanar de J. H. Mangles*, of rich crimson tint, and large truss and flower. The firm also exhibited that charming seasonable *Witch Hazel*, *Hamelis arborea*, four plants well furnished with flowers.

Messrs. BARR & SONS, King Street, Covent Garden, showed a potful of *Galanthus Elwesii* var. *Whittallii*, grown out-of-doors. The flower externally is pure white, supported on a peduncle 8 inches high, i.e., 1 inch higher than the leaves at this date. Two pansful of *Polyanthus Narcissus*, otherwise the Good Luck Lily, were shown as an example of water culture. They were robust and prolific.

Awards.

To Messrs. J. VITCH & SONS, Ltd., Royal Exotic Nurseries, Chelsea, for *Rhododendron multicolor* var. "Triton," a variety with a small truss of moderate sized flowers of a cherry-red tint, very free, and novel as regards the colour (Award of Merit).

To LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House (gr., Mr. Hudson), for *Justicia flavicomis*. The species is a useful addition to garden plants which flower in the winter. The flowers are terminal, freely produced, and of a light yellow tint (Cultural Commendation).

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), J. Colman, J. Douglas, E. Hill, A. Hialop, H. A. Tracy, F. J. Thorne, W. H. Young, W. H. White, H. J. Chapman, J. Gattiel, F. Sander, De B. Crawshaw, H. T. Pitt, and T. B. Haywood.

The show of Orchids has been much better than has been the case at the last few meetings, and a number of interesting subjects were brought before the Committee. Sir Trevor Lawrence, Bart., Burford (gr., Mr. W. H. White), sent a good collection of finely-grown plants, showy, and also of botanical interest. Among the former were splendid plants of the Burford hybrid *Dendrobium* × *Burfordense* and *D. × melanodiscus* Rainbow, very profusely flowered; also a plant of *D. × Cordelia*, a mass of bluish-white flowers with purple-coloured centre; *Cypripedium* × *Salteri* Hyeannum with ten fine flowers; *C. × Leeanum* Albertinum, very fine; the singular *Epidendrum amplexicaule*, and others, which will be found in the list of awards.

Sir Frederick Wigan, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), was awarded a Silver-gilt Flora Medal for a very handsome group composed of fine examples of rare things, many of which, such as the *Phalenopsis*, of which there was a display, are considered difficult to grow. There were twenty-five spikes of *P. Schilleriana*, and one of the unique white variety "Vestalis;" *P. Stuartiana*, and the fine Wigan's variety off; *P. Aphrodite*, *P. amabilis*, and others. Also in the group were *Dendrobium atro-violeum* with eighteen spikes; *D. Ainsworthi* Leechianum, *Laelia Lawrenceana*, some good *Laelia autumnalis atrovirens*; *Cypripedium* insignis "Harefield Hall variety," *C. × Godseffianum*, *C. callosum*, *Vanda lamellata*, *Erised vanderum*, with eleven flowers; *Oncidium Warscewiczii*, *Masdevallia × Pourbaiki*, and the handsome *Laelio Cattleya × Callistoglossa* "Princess of Wales."

The Right Hon. Lord Rothschild, Tring Park, Tring (gr., Mr. E. Hill), showed a magnificent spike of a very fine variety of *Odontoglossum crispum*, grown at Tring Park for seventeen years, the flowers being of good size and shape, each of the sepals bearing a purplish blotch. The inflorescence, which was about 3 feet 6 inches in length, had three branches, the number of flowers being thirty-seven (Cultural Commendation).

Haron Schroeder, The Dell, Staines (gr., Mr. H. Ballantine), showed a magnificent spike of *Odontoglossum × Wilckeanum* Schroederianum, with a broadly-branched spike of white flowers, heavily blotched with purple.

Messrs. JAS. VEITCH & SONS, Chelsea, staged an effective group, in which were good examples of *Cypripedium × Niobe*, *C. × Leeanum*, *C. × Hera* in many varieties, *C. × vexillarium*, *C. × Mino*, *C. × Harrisianum* Dautchieri, *C. × Leonidas*, *C. × Carnusianum*, Veitch's variety, *C. × Lathamianum*, *Dendrobium × Wardianum-japonicum*, *D. atro-violeum*, *D. × Cassiope*, *D. × euanthemum leucopetrum*, *D. × dulce*, *D. Findlayannum*, the pretty new *Phalenopsis × Hymen* (Manni) ♀, *Luddemanniana* ♂, &c.

Messrs. HUGH LOW & CO., Clapton, showed two distinct forms of *Cymbidium Tracyanum*, *Dendrobium × Vannerianum*, *Phalenopsis × Schilleriano-Stuartiana*, and *P. × intermedia Brymeriana*.

G. F. MOORE, Esq., Chardwar, Bourton-on-the-Water (gr., Mr. Morris), sent *Cypripedium × Beekmanni* in fine flower; *C. × Mooreanum*, resembling a fine form of *C. × Hera*; and *Cattleya Percivaliana*, "Chardwar variety."

W. P. BURKINSHAW, Esq., Hessele, Hull, sent *Cypripedium × nitens*, "Hessele variety," a very handsome form; and *C. × Hera punctatum*, in which the large white dorsal sepal bore rose-purple spots.

Sir WM. MARRIOTT, The Down House, Blandford (gr., Mr. Denny), sent *Odontoglossum crispum castum*, a pure white variety, with light orange-coloured blotches on the lip.

Messrs. F. SANDER & CO., St. Albans, showed a finely-flowered specimen of *Dendrobium atro-violeum*.

J. T. BENNETT-POW, Holmewood, Cheshunt (gr., Mr. Downes), showed a splendidly grown plant of *Laelia anceps Sanderiana* with four spikes, three of five and one of four flowers (Cultural Commendation).

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham, showed *Dendrobium × Galatea* (moniliforme × *Holsee roseum*).

Messrs. CHARLESWORTH & CO., Heaton, Bradford, showed *Laelio-Cattleya × Cappel* (*L. cinnabarina × C. Warscewiczii*) with pretty light yellow flowers, with purple markings on the narrow wavy lip; and *Cypripedium × Cowleyanum* magnificum.

DR B. CRAWSHAY, Esq., Rosefield, Serenoaks (gr., Mr. S. Cooke), showed four good forms of *Odontoglossum Rosii* majus.

Messrs. STANLEY-MORRIS & ASHTON, Southgate, sent *Cattleya Luddemanniana* Abnor Hassall, a pretty variety with dark rose markings on the petals.

G. W. LAW-SCHOFIELD, Esq., New-Hall-Hey, Rawtenstall (gr., Mr. Shill), sent *Cypripedium × nitens albens*.

Awards.

FIRST-CLASS CERTIFICATE.

Cypripedium × Sanderiano-Curtisii (*Sanderianum* ♂ *Curtisii* ♀).—A very stately hybrid with the foliage much resembling a strong, light-coloured *C. Curtisii*, the large labellum of the flower and staminode also closely following that species.

The ovate, acuminate upper sepal is greenish-white, with distinct chocolate-purple lines. Lower sepals similar, but smaller and lighter marked. Petals arched and decurved, extending about six inches, whitish-rose, with dark purple spots. Lip and staminode reddish-rose. The wavy upper edge of the petals closely resembles *C. Sanderianum*. From NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray).

Epidendrum × Wallisii-ciliare superbum (*Wallisii* × *ciliare*).—A fine improvement on the others of this singular cross.

Sepals and petals dark yellow; lip white, with rose-purple markings. From Messrs. JAS. VEITCH & SONS, Chelsea.

Phalenopsis × Schilleriano-Stuartiana.—A very fine hybrid, with well-rounded flowers, partaking of the characteristics of both parents named, especially in the lip, which is quite intermediate. Flowers white, with a delicate rose-pink tint on the sepals and petals, and red markings on the yellow disc of the lip. From Messrs. HUGH LOW & CO., Enfield.

AWARDS OF MERIT.

Calanthe Regnierii atoleuca.—A pure white variety of the pretty winter-flowering species. From Sir Trevor Lawrence Bart. (gr., Mr. W. H. White).

Laelio-Cattleya × callistoglossa Princess of Wales (*C. Warscewiczii × L. purpurata Russelliana*).—A finely-formed flower of a delicate rose colour, the front of the broadly-expanded labellum being of a bright, yet dark rose-tint. A fine plant with eight flowers was shown by Sir Frederick WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young).

Cypripedium × Actenus Langleyense (insigne *Sanderæ* ♂ *Leeanum* ♀).—In form this resembles *C. × Leeanum*, though in colour it is nearer to *C. insignis Sanderæ*. The upper sepal has a pure white ground, with a small green blotch at the base, and a few purple spots. Petals and lip are yellow, the former with a slight brown line, and some dark coloured hairs at the base. From Messrs. JAS. VEITCH & SONS, Chelsea.

Laelia × Mrs. Gratrix superba (*cinnabarina* ♀ *Digbyana*).—Flowers of a clear yellow tint; the lip fringed. From Messrs. JAS. VEITCH & SONS.

Phalenopsis × intermedia Brymeriana (*Aphrodite* × *rosea*).—In this case probably *P. rosea* was the seed-bearer, as the variety *Brymeriana* has flowers with more of the form of that species. The sepals and petals are tinted rose-pink; the lip dark rose-crimson. From Messrs. HUGH LOW & CO.

Laelio-Cattleya × Fanny Leon (*L.-C. × exoniensis* × *C. labiata*).—A fine flower somewhat resembling *L.-C. × eximia*. The sepals and petals of a clear rosy-lilac; the lip rich purplish-crimson, with yellow markings at the base. In outline, the lip partakes closely of *L.-C. × exoniensis*. From H. S. LEON, Esq., Bletchley (gr., Mr. A. Hishop).

Laelio-Cattleya × Swaray (*L. cinnabarina* ♀ *C. superba* ♂).—A very distinct and brightly-coloured hybrid of a new form, the labellum being curiously modified to approach *C. superba*. Sepals and petals bright copper-orange; lip claret-crimson, with yellow centre. From Messrs. CHARLESWORTH & CO., Heaton, Bradford.

Laelio-Cattleya × Charlesworthi (*L. cinnabarina* ♀ *C. aurea* ♂).—A very fine hybrid, with flowers equal to those of *L.-C. × Hippolyta*, but different in colour. The sepals and petals are of a reddish-orange tint; the lip is marked with bright purple. From Messrs. CHARLESWORTH & CO., Heaton, Bradford.

BOTANICAL CERTIFICATES.

Dendrobium Madonna.—An elegant species of the slender growth of *D. Amboinense*, and bearing profusely, drooping sprays of white flowers, the labellum having a greenish tint, and some rose-coloured markings at the front. From Messrs. F. SANDER & CO.

Tainia Penangiana.—A Malayan species, with tall sprays of curiously-shaped brownish-green flowers. From Sir Trevor Lawrence Bart. (gr., Mr. W. H. White).

Masillaria leptosepala.—Flowers small, white, tinged with rose. From Sir Trevor Lawrence Bart.

Masillaria arachnites.—Flowers numerous; segments narrow and drooping; clear yellow. From Sir Trevor Lawrence Bart.

Fruit Committee.

Present: G. Bunyard, Esq., in the Chair; and Messrs. W. Poupart, Jos. Cheal, James J. Veitch, A. H. Pearson, Alex. Dean, S. Mortimer, W. Bates, C. Herrin, Geo. Wythes, H. Balderson, J. Smith, G. Norman, J. Willard, and Robt. Fife. A vote of condolence was passed with the family of the late Mr. Blackmore, who was for many years a member of this committee.

Messrs. SUTTON & SONS, Reading exhibited a quantity of ripe fruit of a new Tomato Winter Beauty, a smallish-flattened, very slightly furrowed fruit of a bright scarlet colour. If it be a free copper, we have a useful winter variety in Winter Beauty. It has previously been given an Award of Merit.

Messrs. J. VEITCH & SONS, Chelsea, sent a handsome dish of their Royal Late Cooking Apple, a culinary variety that has already been given an Award of Merit. This award was confirmed.

Mr. J. Chinnery, gr. to the Marquis of ABERGAVENNY, Nevill Court, Abergavenny, sent a dish of Apples "Welsh Beauty," of fairly good flavour and appearance.

From Messrs. G. BUNYARD & CO., Maidstone, came fourteen dishes of Apples, of excellent appearance, and generally of good quality. Included were the following varieties: Improved Ashmead's Kernel, an Apple of good flavour; and a late keeper; and Transparent de Croncels, said to be useful from October until February as a cooking Apple, or for jelly; Hornmead's Pearmain, a good old variety, was well shown; as also were Foster's Seedling, a cross between Blenheim and Cellini Pippins; Beauty of Kent, a good old kitchen variety, but rather past; Belle de Fontaine, Chabley's Kernel, Farmer's Seedling, King of Tomkins County, White Nonpareil, and Twenty Ounce.

Mr. MORRIS, of Sandhurst, was introduced to the members of the Fruit Committee, and showed specimens of dried Plums and other fruits converted by a new and (said to be) a cheap process. The chief question, however, he appeared anxious to solve, was that of how to obtain a supply of Plums and other fruits for drying at a sufficiently low cost to compete successfully with those imported from California and elsewhere.

Awards.

Apple Hornmead's Pearmain.—A well-known cooking Apple, in season from November until April. From Messrs. Geo. BUNYARD & CO., Maidstone (Award of Merit).

Apple Norman's Pippin.—A dessert variety of medium size, slightly russety, and of fairly good flavour. From Messrs. Geo. BUNYARD & CO., Maidstone (Award of Merit).

DEVON AND EXETER GARDENERS'.

JANUARY 17.—The opening meeting of the spring season took place on the above date, Mr. J. MERRITT, gr. to Mr. R. ASHBY, Watford House, Exeter, being the essayist for the evening. The subject of the essay was "The Management of Caladiums for Decoration and Exhibition."

Mr. MERRITT said, that effective as Caladiums were as exhibition plants, the small prizes offered at provincial shows for them discouraged their cultivation by gardeners and specialists; there was also the further disability in the plant requiring the utmost care in packing and transit to preserve the foliage from injury, and the susceptibility of the plant to injury from being placed in a draughty tent or hall. Treating of their cultivation, Mr. Merritt said he potted up his bulbs early in February, the soil used being rough turfy loam, charcoal, rough leaf-mould, sharp drift or silver-sand, and some rough stable manure, not sodden, but similar to that of a spent Mushroom-bed. He used 16-pots, the size in which he exhibited them; they were potted up like Lillies, leaving room at the surface for a top-dressing. Not having the requisite bottom-heat for starting them in, he put them on a bed of moss on a thick plank on one of the flow-pipes under the staging. After they had attained a height of about 6 inches, he put them on the top stage behind other plants, gradually inuring them to the light. As they strengthened, they were afforded an increase of light by degrees, the roots filling the compost. When they were so far advanced he then top-dressed them, and applied a little weak liquid-manure water, increasing the strength of it as the leaves developed. When the plants were fit for exhibition, he shifted them from the stove to a vinery, having a temperature several degrees lower, and he then afforded more air. The larger leaves he supported by placing a blunt-ended stick under them. For ordinary purposes of indoor decoration he used 48's, 54's, and 32's pots, but instead of forcing the plants into growth, he placed them on the ordinary stove-stage, giving them very little water until they had made a fair start, subsequently taking them to the coolest end of the stove, or the warm end of an intermediate-house, not coddling them in any way. An important consideration is, not to afford a great deal of water. He kept the bulbs through the winter, after allowing the foliage to die down, by placing them on a thick plank on the flow-pipes, looking them over about once a month and applying some water to prevent dry rot.

SWEET PEA BICENTENARY CELEBRATION.

JANUARY 19.—The first general committee meeting in connection with the Bicentenary Celebration of the Sweet Pea was held in the Horticultural Club Room, Hotel Windsor, on Friday, when Mr. GEORGE GORDON, V.M.H., presided over a very representative gathering.

The Chairman briefly alluded to the desire expressed in 1899 by leading amateurs, nurserymen, seedsmen, and market growers, that a comprehensive exhibition of Sweet Peas should be held during 1900, together with a Conference, one duty of which should be the classification and selection of varieties. This desire led to a meeting in Edinburgh in September last, when Mr. Gordon (chairman), Mr. H. J. Jones, and Mr. R. Dean (secretary) were elected as a preliminary committee to draw up a scheme for the celebration, and submit it as early as possible to the general committee. After this brief statement, the Chairman requested the Secretary, Mr. R. Dean, V.M.H., to read the letters received from the Crystal Palace Company and the Royal Aquarium Company. The former offered to accommodate the exhibition, provide the necessary conveniences for a conference meeting, and subscribe £20 to the prize fund; this being the best offer, it was agreed, on the proposal of Messrs. H. A. Needs and H. J. Wright, that the Bicentenary Celebration be held at the Crystal Palace, Sydenham, on July 13 and 14, 1900, or as near those dates as could be conveniently arranged without clashing with other exhibitions.

Having settled the place and date of celebration as far as possible, the next point for discussion was the schedule of prizes, of which a preliminary draft had previously been communicated to the Vice-President and committee. Before the discussion of classes and prizes, a list of subscriptions received and promised, up to date, was submitted by the Secretary, amounting to nearly £90. As the whole of the subscriptions received were unsolicited, the committee felt that the success of the undertaking was practically assured, believing that those interested in the most beautiful, useful, and fragrant of annual flowers, the Sweet Pea, would not fail to show their practical sympathy with the committee's efforts as soon as affairs had received definite form. The schedule is a comprehensive one of twenty-eight classes, each with four, and some with five prizes, offered on a most liberal scale. Cases by class the schedule was discussed, and numerous minor alterations made. Nineteen open classes are provided for cut blooms, all to be shown in vases, these including classes for forty-eight, thirty-six, and eighteen bunches, and thirteen classes for one

bunch of a specified colour or colours. Four classes are limited to amateurs employing either one or no regular gardener, and there is a division, open to all, consisting of five classes instituted for the purpose of demonstrating the value of Sweet Peas in all forms of decoration. The total amount offered in prizes in the preliminary schedule exceeds £90, and this comparatively large sum should ensure a display of the most beautiful and instructive character.

Special prizes are invited, but they must, in accordance with the resolution passed at the Edinburgh meeting, be free from any trade conditions. Already several firms have intimated their intention of providing the prizes in certain classes, and at this meeting it was decided to accept Mr. Henry Eckford's generous offer of £15, the sum offered in Class 1 for forty-eight bunches of Sweet Peas in not fewer than thirty-six varieties, an offer made by the Wem veteran to commemorate the fact that this is the twenty-first year of his work in selecting and cross-fertilising Sweet Peas. Mr. H. J. Jones' offer to supply the prizes in Class 25, for an epergue of Sweet Peas, £2 17s.; and Mr. R. Sydenham's offer to supply the prizes in two of the amateur classes, amounting to upwards of £5, were accepted and acknowledged. With reference to the rules and regulations for competitors, it is worth while noting that from subscribers of 10s. 6d. and upwards no entrance-fees will be demanded, but non-subscribers must pay an entrance-fee of 5s. to entitle them to compete in any six classes (subject to divisional schedule regulations), but a further entrance-fee of 5s. must be paid if this number is exceeded.

Conference proceedings, subscribers' tickets, publication of report, and other matters were referred to, but reserved for final discussion and settlement at the Committee meeting to be held on Friday, February 23, by which date the complete schedule, regulations, &c., &c., will be ready for acceptance and immediate publication.

Meanwhile, the Committee desires the sympathy and financial assistance of all horticulturists, so that the forthcoming celebration may be made the unqualified success its interest and importance demands. Any surplus funds remaining after the payment of prizes and necessary expenses will be given to the gardening charities.

Further particulars can be obtained from the Hon. Secretary, Mr. R. Dean, V.M.H., Ranelagh Road, Ealing.

MISCELLANEOUS SOCIETIES.

Ipswich Gardeners' and Amateurs' Mutual Improvement Association.—The public meeting mentioned in the *Gardeners' Chronicle*, January 6, was held in the Ipswich Town Hall on the 15th inst., most of the local nurserymen and gardeners attending. The proposition to form an association was carried unanimously, a committee of nine being appointed to arrange details; Mr. W. E. Cross, Holy Wells Gardens, was elected Hon. Secretary.

Obituary.

R. D. BLACKMORE.—We much regret to record the death of this celebrated novelist, which took place at his residence at Teddington on Saturday, January 20. To the general public Mr. Blackmore will be best remembered by his novel, *Lorna Doone*, which appeared in 1869, and is one of the great novels of the century. By gardeners he will be long remembered as a cultivator of Pears and market-gardener, carrying on business at Teddington, and as we know from personal correspondence not with any great amount of success. Probably the busy man of letters regarded his venture in this field of activity chiefly as a means of relaxation, not looking over-carefully to the monetary side of it. The late Dr. R. Hogg thought highly of his estimate of the cropping and edible properties of Pears, and interspersed the novelist's opinions freely throughout his descriptive notes on varieties of Pears in the *Fruit Manual*.

For our own part we attached but little value to these estimates and opinions, being aware of the immense influence of soil, climate, situation, and methods of cultivation on the cropping capabilities and quality of Pears, and that what might or might not succeed at Teddington would turn out otherwise in other localities. Mr. Blackmore, besides Pear-trees, possessed at Teddington a most prolific Vine, of which he was very proud.

Some years ago he actively identified himself with the work of the Royal Horticultural Society, and for some time was a member of the Fruit Committee. He was born in 1825, at Longworth, Berkshire, his maternal grandmother being a descendant of Dr. Doddridge, whence his name, Richard Doddridge Blackmore.

JOHN FRASER.—The death of Mr. John Fraser, on the 20th inst., at the age of seventy-eight years, removes from horticultural circles a well-known figure. In the course of his life he had come into notice as a high-class cultivator and successful exhibitor, as judge, valuer, committeeman; and in other capacities he lived and moved among his contemporaries till the close of his life. He is almost the last of those who occupied a seat on the Floral Committee of the Royal Horticultural Society when it was first formed in 1859, and he died one of its Vice-Presidents.

Of his early years but little appears to be known. He and his brother James succeeded, when young men, to the management of the business in the Lea Bridge Road, founded by their father, and under their management the firm became widely known for the cultivation of hard-wooded plants, and as exhibitors of specimen stove and greenhouse plants. At all the great horticultural exhibitions held in London during the past half century they were exhibitors. Specimen Pelargoniums of all sections they grew well; Azaleas were successfully grown and exhibited; and their encounters with Mrs. Laurence

took great interest in local matters, and was for a considerable period chairman of the Local Board. A few years since the rapid growth of the neighbourhood necessitated the transference of the business to South Woodford, where an entirely new nursery was formed, and where Heaths, Vines, Ivies, &c., in addition to a general stock, are the leading features. The business will henceforth be carried on by his son, Mr. John Finlay Fraser.

During the past year, Mr. Fraser was able to put in an appearance at the meetings of the Royal Horticultural Society; but he, except on one or two occasions, no longer sat at the committee-table. Having been widely known, his death will create a feeling of regret in the hearts of many who in the course of his long and active life had come into contact with him.

JOHN NUNNS.—Many of our readers will learn with regret of the death of this once well-known gardener, on the 15th of this month, at the age of seventy-one. The deceased, who had retired from the gardening world for some years, was for twenty-six years head gardener to Sir John D. Llewellyn, at Penllergare, near Swansea.

MARKETS.

COVENT GARDEN, JANUARY 25.

(We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.)

CUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

and other leading exhibitors is a matter of history; as is also the incident of Mrs. Laurence purchasing from the Lea Bridge firm the whole of the collection of plants which defeated her's at one of the great Chiswick shows, and taking over May, the grower, also with the plants.

As one of the founders of the National Floricultural Society in 1851, Mr. Fraser remained connected with it as one of its leading censors until it was dissolved in 1859. His services were in great request as a judge, and as a valuer of horticultural stock he was, perhaps, almost without a rival; his high-minded integrity was acknowledged on every hand. The firm exhibited at all the Chiswick exhibitions up to the last in 1858; at the Regent's Park, at the Crystal Palace, and at some, at least, of the provincial shows of the Royal Horticultural Society. At the Great International Horticultural Exhibition held at Kensington in 1866, they were important exhibitors, staging, in addition to Pelargoniums, Azaleas, &c., twenty-four large specimen greenhouse plants, of which the names and dimensions were recorded at the time.

Some years ago the partnership between the brothers was dissolved, and the business was carried on by John Fraser. While at Leyton he

REMARKS.—A fair supply of English Apples still come in, some of which are very good. Parsley keeps low in price. Onions are easier in price, with good supply; the last consignment of Cap's Plums realised per box 5s. to 9s. Stachys, or Chinese Artichokes, are now coming in.

SEEDS.

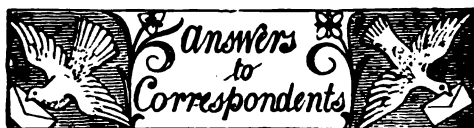

JANUARY 24, 1900.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Ford, Borough, London, S.E., report a thin attendance of buyers on to-day's market, with but few transactions passing. Meantime, there is an improving general inquiry for field seeds, and prices all round keep very firm. Alsyke, especially, exhibits increased animation. For Perennial Ryegrasses, the tendency of values is still upwards, whilst Imported Italian keeps steady. There is a rather better demand for Tares, and Rye is inquired for. Owing to the mild and unseasonable weather, the consumptive request for Blue Peas, Haricot Beans, and Spanish Lentils, is naturally restricted. Full prices are asked for Mustard and Rape-seed. The market for Bird Seeds calls for no remarks.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending January 20, and for the corresponding period of 1899, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1899.	1900.	Difference.
	s. d.	s. d.	s. d.
Wheat	37 0	36 0	- 1 0
Barley	27 11	25 8	- 2 3
Oats	17 1	16 2	- 0 11

(For remainder of Markets and Weather, see p. xii.)

ARALIA SIEBOLDI: Findlay Bros. The appearances are due to a check to growth, but of what this consisted we are unable to inform you with certainty. Perhaps root-disturbance after growth had begun.

ARUMS AND MARKET PRICES: H. B. These vary from day to day, and sometimes hourly. Much depends on the day and time of arrival, and the demand.

CAMPHER AS A PLANT STIMULANT: X. Y. Z., Sheffield. The substance finding a use in Japanese gardening; it has, doubtless, useful properties as a manure, and deterrent against insects infesting soils and plants. We know but little of its uses here.

"CONTINENTAL HORTICULTURAL JOURNALS:" N. B. Möller's *Gärtner's Zeitung*, Erfurt, has a large circulation. *Revue de Horticulture Belge*, published, 132, Rue de Bruxelles, Ghent. *Wiener Illustrirte Garten Zeitung*, published by Wm. Frick, K. und K. Hofbuchhandlung, Vienna, Austria.

CYPRIPEDIUM INSIGNE: C. B. Divide as soon as growth begins, spreading the roots out in the soil, which should consist of good fibrous peat two parts, live sphagnum-moss one part, a small quantity of charcoal, and silver-sand. Afford good drainage, press the soil firmly, and keep the crown of the root as high as the rim of the pot. Keep in a warm, shaded glasshouse till re-established, then inure them to a slightly cooler temperature. Afford water not too abundantly at the first, increasing the amount as the plants recover their health.

DAISIES IN BOWLING GREEN: D. W. Encourage a smothering growth of the grasses by using Watson's Lawn-sand, fish, or other manures. If but few Daisies exist, spudding them out might be advisable. If the turf is much infested, nothing short of digging the ground and re-sowing with the finer grasses will be of any use.

FURZE ON 5 ACRES OF LAND: H. W. C. You will find that seed sowing is more economical and satisfactory than planting. The land should be deeply ploughed and well harrowed, the seed being sown in drills and after covering, well rolled.

INSECTS IN MUSHROOM-BEDS ON ROOTS OF TOMATOES, &c.: E. P. The little glassy-white worms are not Tylenchii, but the larvae of a species of *Sciara*, and probably the *S. fucata*; but in the absence of the perfect insect, it is impossible to state definitely to which species they belong. Many of the larvae sent had pupated en route, which in due course will produce very small, swarthy, two-winged flies belonging to the order Diptera. The food of these larvae consists almost entirely of decayed vegetable matter. They often swarm in leaf-mould, dung, &c.; and *S. fucata* has been known to attack young Wheat plants. Those in your Mushroom-house were carried in with the manure; and those present at the roots of your Cucumbers and other plants, were probably introduced in the compost, which, judging from the sample submitted, contains a large percentage of decayed vegetable matter, such as these larvae would revel in. You may attract the larvae by inserting pieces of decayed Potato into the soil near the affected plants, and in the Mushroom-beds; and if the perfect flies are now appearing, fumigation would destroy them; but your safest course is to remove the affected soil and make a fresh start. R. N.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—May. 1, *Selaginella Wildenowii*; 2, *Polystichum angulare*; 3, *Nephrolepis tuberosa*; 4, *Asplenium lucidum*; 5, *Begonia maculata argyrea*; 6, *Begonia incarnata metallica*.—Lamb. 1, *Dieffenbachia nobilis*; 2, *Pittonia Pearcei*, *Codisium* (Croton), but which variety it is not possible to say by the poor specimen sent.—F. L. Stanhope Wardi aurea.

PARIS-GREEN FOR SPRAYING APPLE-TREES: *Viridis*. First application, before the buds start—important; second, just before the flowers open; third, soon after the latter fall; fourth, ten to fifteen days later; fifth, ten to fifteen days later if spot disease is severe; and for borar at end of June. Formula: Paris-green, 1 lb.; lime, 1 lb.; water, 200 gallons.

PEACHES FOR FORCING: *Old Subscriber*. Alexander, Early Rivers, Early Grosse Mignonne, Doctor Hogg, Grosse Mignonne, Noblesse, Bellegarde, Stirling Castle, and Albatross. These ripen in the order of their names.

POMEGRANATE NOT FLOWERING: C. B. In your latitude (Sheffield) the plant should not be placed out-of-doors in the summer, but be afforded a warm situation in the greenhouse or intermediate-house, not shading it at any time. Look to the roots, and afford new soil in March, and ample drainage. Pot firmly, in loam, peat, leaf-mould, and sand. The plant being deciduous, should be afforded a good long rest in a cold place, seldom affording water in the winter. Keep the shoots fairly thin, cutting out all those too weak to bear flowers, leaving short snags to form spurs. Keep it syringed well whilst growing. The sort of pruning afforded the Plum and Apricot suits the Pomegranate.

POND CLEARING: J. S. The stuff is almost valueless, excepting when dry, as a dressing for poor grass-land. Being destitute of all fibre, roots, &c., it sets together very closely when used alone, and is quite unsuited to the growth of the *Rhododendron*.

REDUCING THE HEIGHT OF PALMS: X. There is nothing to be done, if you cannot sink the receptacles in which they are growing into the floor of the house. They might live if you headed them back, but their beauty, even should they throw out growths, would never be recovered.

ROSES, H.P.'s, DOING WELL ON THEIR OWN ROOTS: B. F., *Vik and Vadsbro, Sweden*. A. K. Williams, Anna Alexieff, Baron Bonstetten, Baroness Rothschild, Baron Prevost, Beauty of Waltham, Black Prince, Boule de Neige, Dr. Andry, Duchesse de Vallambrosa, Duchess of Bedford, Duchess of Norfolk, Etienne Levet, Fisher Holmes, General Jacqueminot, Jules Margottin, Lady of the Lake, Louis van Houtte, and many other hardy varieties.

TOPPING AN ARAUCARIA EXCELSA: C. B. With a sharp knife partially sever the leader at any desired height, and let it hang down by a strip of wood and the bark. When in the course of time the wound makes a callus, it may be taken off; insert in a pot in sandy soil, and place in a warm case to make roots. If the callus becomes black, place the cutting in fresh soil.

VERMOREL'S SPRAYING SYRINGES: H. B. Scan our advertising columns, or make application to some horticultural sundriesmen, as Osman, Anderson, and Richards, whose addresses are often to be found in our columns.

WEBS ON THE BARK OF A TREE: P. Murray Thomson, Kilpunt, Broxburn. The conspicuous webs in the crevices of the bark of the Laburnum are not scales, but are the silken coverings made by female Psocids to protect their eggs. These insects are not injurious to the trees; they feed chiefly upon the Protococci on tree trunks. R. N.

THE LONDON BOTANIC GARDEN.

FOR more than two centuries Chelsea and its vicinity has been celebrated for its gardens—botanic, nursery, market, private, and tea-drinking. It is still one of the Meccas of floriculture, and its Apothecaries' Garden remains to remind one of a time when the city was far distant, and Chelsea itself a rural hamlet. The private gardens have long since degenerated into back-yards, where Mignonette and Geraniums lead a brief and sooty existence of a few weeks' duration; and the market-gardens have long since been elbowed some miles further out into the suburbs. The history of Chelsea and its various gardens would fill a fairly large volume, of which a very considerable portion would be taken up with Cremorne Gardens and its manifold frivolities.

Apart from the gardens of the Society of Apothecaries, no phase in the earlier history of Chelsea Gardens is more interesting than that of the London Botanic Garden, which William Salisbury successfully inaugurated in 1807, and which was in existence for about a quarter of a century. It is not easy to realise, in visiting Chelsea to-day, that men by no means very old remember the place when it was a pleasant retreat, with a distinctly countrified air about it. The penny 'bus and the underground railway have long since robbed it of its rural character. The rapid merging of Greater London into London proper has been the immediate cause of the obliterating of landmarks and historical spots without number, and among these the London Botanic Garden.

Of William Salisbury, the man who planned

and laid out this remarkable place, very little is known. In the *Gentleman's Magazine* of 1810, in an article describing his Botanic Garden, he tells us that he was in 1792 a pupil of Curtis, whom he joined as partner in 1798. His first publication, *Hortus Paddingtonensis*, was an exhaustive catalogue of plants cultivated in the garden of John Symmons, F.R.S., at Paddington House, to whom Salisbury was gardener, and to whom the book is addressed. The preface is dated September 25, 1797, and the writer speaks in very high terms of his employer's liberality and of his "generous bounty," so that the catalogue was doubtless published at Mr. Symmons' expense. The catalogue is an extraordinary one, and the garden probably could have claimed to contain a greater variety of plants than any other private establishment in the kingdom. Close upon 4800 species and varieties of plants and trees, English and foreign, are alphabetically enumerated, first by the Latin and then by the English name, followed by an initial to indicate whether the particular plant is hardy, or stove, or greenhouse, and then the signs of the plant's duration. Curiously enough, my copy of this striking memento of a Paddington garden of a century ago is bound up with the second edition of James Donn's *Hortus Cantabrigiensis*, 1800, from which it would seem that the Botanic Garden, Cambridge, claimed to possess only about 5400 different species and varieties.

Salisbury left Mr. Symmons soon after his elaborate catalogue was finished, and became a partner with William Curtis (the well-known nurseryman, and founder of the *Botanical Magazine*), at Queen's Elm, Brompton. Curtis died in July, 1799, and Salisbury (owing to the lease of the Brompton Garden being on the point of expiring) removed soon after to Cadogan Place, Sloane Street; and it was here that he formulated and carried out the London Botanic Garden. The idea itself was not original, for Curtis had started a similar institution at his nursery garden near the Queen's Elm Turnpike, the subscription being one guinea per annum, or two guineas, which entitled the subscriber to seeds, roots, and so on, up to a certain value. Salisbury doubtless succeeded to Curtis's library of botanical books and extensive collection of drawings, and these, with the great variety of plants, formed the nucleus of the new gardens.

The London Botanic Garden consisted of about six acres of ground, so arranged that a person could walk nearly two miles without entering the same path twice; the whole forming, apart from its scientific arrangement, a "delightful promenade," as Faulkner states in his *History of Chelsea* (1829). The scope or aim of the garden is fully explained in the preface to Salisbury's *Botanists' Companion*, which the author describes as an introduction to the knowledge of practical botany and the uses of plants either growing wild in Great Britain, or cultivated for the purposes of agriculture, medicine, rural economy, or the arts. The book was published in two volumes by Longmans in 1816. The admission to the garden and library was one guinea for twelve months. During summer there were, on Mondays and Thursdays, lectures written by Salisbury himself, on botanical topics; and about twelve excursions were made within three months to such places near London "as are known to produce the greatest number of plants." To attract those who cared for neither lectures nor excursions, the proprietor

arranged for concerts on Tuesdays and Saturdays, from May to September.

The *Botanists' Companion* is, for the time, a really noteworthy compilation, and the arrangement is on a similar plan to that of Graeber's *Catalogue* (1789), and Galpine's *Compendium* (1806), and is one of the most comprehensive works of its kind which had appeared in England up to 1816.

A very considerable part of Sloane Street, between the Square and Cadogan Place, was taken up by Salisbury's Botanic Garden, and for some years it was a very fashionable promenade. In 1820 the property changed hands, the new owner being a Mr. Tate, who altered the place considerably, and converted it into a nursery. The London Botanic Garden, however, during its existence, absorbed a number of interesting collections of both living and dried plants. G. Ackerman presented a number of new and undescribed plants from South America, including *Echeveria grandifolia*; Capt. Paterson, of the East India Company, gave a choice collection of Chinese plants; a Mrs. Brown, of Cadogan Place, sent some Ceylon plants. It also absorbed Bullock's extensive collection of plants formed in Mexico; and many rarities came from Mr. R. P. Staples, whose collection of Cacti is described in the *Philosophical Transactions* by Mr. A. H. Haworth. Other benefactors included the Hon. and Rev. W. Herbert of Spofforth, and the Right Hon. Lady Amherst. When the London Botanic Garden was in its prime, a plan was drawn up and engraved for the *Gentleman's Magazine* (to which Salisbury was an occasional contributor), and published in the issue for August, 1810. This plan was republished as a frontispiece to the first volume of Salisbury's *Botanists' Companion* six years afterwards.

It is not known for certain—or, at all events, I have been unable to ascertain—when the London Botanic Garden ceased to exist. Probably, as is generally the case, it was encroached upon bit by bit. It was described by Faulkner in his *History of Chelsea* in 1829, but it is not alluded to in any way by J. C. Loudon in the edition of his *Encyclopedia of Gardening*, which appeared in 1835. As Loudon had lived at Bayswater for many years when Faulkner wrote his book, the London Botanic Garden must have been known to him, and if it then existed, would have received due notice in the *Encyclopedia*. It is, however, rather a curious fact, that Salisbury's publications are not mentioned in either the *Encyclopedia* or in the *Hortus Britannicus*. Salisbury died in 1823.

Early in 1816, Salisbury published, in addition to the elaborate *Botanists' Companion*, already mentioned, a small book of about 200 pages (through Longmans), entitled, *Hints addressed to the Proprietors of Orchards, and to Growers of Fruit in General*. It consists largely of observations made during the previous summer in a tour through the cider counties of England. The author urges certain improvements in the methods of culture, and insists that no more fruit-trees should be grown on any farm than "can be allowed the proper management necessary to promote the ends for which they are intended." Two interesting points are revealed in the course of this little book: first, that several farmers near Petworth "have this season paid their rents by the produce of their orchards;" and secondly, that the author had just recently purchased, for the sake of propagation, the stock of new fruit-trees raised by Mr. Knight at Elton, near Ludlow.

After leaving the London Botanic Garden, Salisbury wrote one pamphlet, *The Cottagers' Agricultural Companion*, 1822, which ran into a second edition in the same year. This little book reveals the fact that the author was still in business at his "nursery ground" at Brompton, Middlesex. In his pamphlet, Salisbury, in an address to the proprietors of landed estates in Great Britain, enlarges upon the necessity of improvement in the education of the labourer and his wife. This, he maintains, may be effected by inducing them to cultivate plots of land on what is now known as the allotment system. Salisbury especially commends the system, "adopted with the best effect" at Newnham under the Countess of Harcourt. His *Cottagers' Agricultural Companion* had an extensive circulation, and it probably did much good; he contemplated, in furtherance of this amelioration of the farm labourer's lot, a pamphlet on the culture and management of bees, but he apparently did not live to finish the work. Although his name is not perpetuated in the usual manner, he undoubtedly rendered botany and horticulture very considerable services, and worthily sustained, as a practical gardener, the good fame of his tutor and partner, William Curtis. *W. Roberts.*

SOPHRO-LÆLIA × MARRIOTTIANA.

On several occasions Sir Wm. Marriott, The Down House, Blandford (gr., Mr. Denny), has exhibited examples of his pretty hybrid *Sophro-lælia*, obtained by crossing *Lælia flava* and *Sophranitis grandiflora*, and some variation in the dark yellow colouring of the flowers has been remarked. At the Royal Horticultural Society's meeting on January 9 last, a plant of it showing a still more remarkable variation was staged, and from it our illustration (fig. 20) was prepared. The sepals and petals were yellow, with a flame-like series of orange-scarlet flakes, extending from the base of each segment to the well-defined, clear, yellow margin. The lip was yellow, with dark reddish-orange markings, having some yellow lines extending from the base. The whole flower, in colour, presented the appearance of one of those yellow and orange flowering *Cannas*, now so popular in gardens.

NURSERY NOTES.

CHINESE PRIMROSES, ETC., AT READING.

A LARGE exhibit at the Drill Hall, on January 9, afforded a foretaste of the display of Chinese *Primulas* Messrs. Sutton & Sons have now in bloom at Reading. It was a most interesting collection of plants, and in one or two instances particularly, varieties possessing flowers of new shades of colour attracted much attention. Since then, however, we have had the opportunity to inspect the entire collection "at home," and it would be very difficult indeed to adequately describe the lovely effect of the thousands of plants grouped in colours, in the many span-roofed houses at the Portland Road Nursery. And in passing, a remark may be made upon the excellence of the houses just mentioned. How admirable they are for the cultivation of *Primulas*, *Cyclamens*, or other dwarf-growing, partially delicate plants, that, blooming at a season of the year when the days are short, and the weather variable, require all the light and sunshine that may be obtainable; and fresh air occasionally, without the injurious accompaniment of cold draughts! The task of many a gardener, who tries his utmost to successfully grow and flower batches of these plants, and winter-blooming *Pelargoniums*, would be materially assisted did means permit of his acquiring these first essentials. The Reading plants are grown for the purpose of producing seeds, and it has been found that small

plants in 5-inch pots, or even less, are best suited to this purpose. Accordingly, the seeds are not sown, we believe, until midsummer has been passed, and if there are no "specimen" plants, with numbers of flower-spikes, and large foliage, they are little missed, for in proportion the younger and smaller ones flower just as freely and strongly, and are each as perfect as the imagination could desire.

In the work of developing such flowers as the *Primula*, the processes of selection, cultivation, and cross-fertilisation are all great factors. Which is the most important matters little; certain is it, that once cross-fertilisation is practised, selection becomes essential. Both these processes may be observed in operation at Reading: here a flower has been fertilised with pollen from a flower of a distinct character, but possibly only in the matter of colour; there, are a few plants withdrawn from a well-known strain. They have shown an improvement over the rest of the same strain,

preserved for years, it was noticeable that varieties are kept so true from seed that little difference in shade of colour even could be detected in the large batches of plants.

CHOICE FIXED VARIETIES.

Speaking now of single-flowered varieties, there are *Snowdrift*, *Pearl*, *Purity*, and *Royal White*; the first-named is the earliest to bloom, and has many good qualities, its pure white flowers and fern-like foliage being very pretty. *Pearl* is rather later, but is one of the best of growers, and has been a favourite for nearly twenty years. *Royal White* has dark foliage, and is therefore distinct from the others of this colour; its flowers are large and beautifully fringed. Of varieties producing flowers other than white there is an ever increasing number, and in the known sorts the strains have been improved by intensifying the colours. *Brilliant Rose* was very noticeable as

FIG. 20.—SOPHRO-LÆLIA × MARRIOTTIANA:
COLOUR YELLOW AND ORANGE-SCARLET.

and it is from such that seeds may be obtained to maintain the strain at its present standard of quality, or possibly raise it in a little degree above any previous condition.

Cultivation, the other factor in development, is often helpful, but sometimes a little troublesome. To cultivation is due, to a very large extent, the evolution of the semi-double type from single-flowered varieties, and the gain has been an immense one; but its influence in some directions, for instance upon the "star" or "stellate" section, is to bring these free-flowering, graceful-habited plants, that recently have been accorded considerable popular favour, more and more into likeness to the florists' type, and in order to preserve the simple form it is necessary to resist or neutralise the influence cultivation would naturally exert upon it. Thus is the work of maintaining and developing a collection of *Primulas* pursued. In one section or "strain," a certain characteristic is encouraged; in another lot of plants the same characteristic is rigidly excluded. There are thus endless balancing of influences, directing of tendencies, and shaking up of possible latent forces.

As we looked over the strains that have been

being true, and in every respect desirable. *Crimson King* also is excellent; its fine flowers are unusually fimbriated, and there is a dark, narrow circle round the centre. A fern-leaved form of this variety has just been prepared for distribution. *Brilliant Ruby*, which superseded the old *Ruby King*, is a first-rate red-flowered *Primula* of dwarf habit, but needs some little encouragement in order to get the blooms thrown well above the foliage. Then there are *Reading Pink*, which flowers moderately early; *Gipsy Queen*, one with bizarre-like flowers, white, splashed with rose; *Rosy Queen*, a pretty variety, with fern foliage; *Reading Scarlet*, and others in the single-flowered section, of which we will only further allude to those known as "blue." The best of these is *Reading Blue*, having plain foliage, and very fine flowers. One known as *Sutton's Blue* has fern foliage, but is otherwise hardly so good; and a new one obtained from crossing the *Reading Blue* upon a white variety, is the *Cambridge Blue*—this is of an exceedingly delicate tint, and with the very light green foliage has a somewhat æsthetic appearance.

The semi-double varieties appeared beautiful.

They flower freely, are capable of reproduction by seed, and though the flowers are not of the same quality as the old double White, they are nevertheless useful for button-holes and spray-making. There are varieties all true to colour in pink, scarlet, carmine, white, crimson, blue, salmon, and carnation flaked. The Carnation flaked semi-double is a very popular variety, one of the strongest growers, and an abundant bloomer. A new stock of this has been obtained by crossing again with Crimson King. The flowers are spotted rather than flaked, and the spotting is very free. It is only recently that a salmon tint has been produced by the doubles, and we are not sure that it is ready for distribution. But it will be very highly appreciated when generally known, as the shade is perfect.

habit of the pyramidalis strain to acquire only part of the excellence in flower possessed by the florists' type.

THE MOST RECENT NOVELTIES.

As typical of the best of the novelties, our artist has reproduced in fig. 21 flowers and foliage of "The Duchess," shown at the meeting at the Drill Hall above referred to, when an Award of Merit was recommended to the strain. The cross was one of Crimson King and Pearl, and this blending has resulted in the charming seedling variety. Its flower-stem is strong and erect, flowers large and of much substance, having a yellowish centre, and white, profusely fimbriated petals, but around the eye is a starred ring of intense rose, which to some degree suffuses the white. We saw other novelties from this and similar crosses that will be certain to

THE CYCLAMENS

were not at their best at the time of our visit, but though their freshness had been partly lost, there were hundreds of plants with a crop of flowers. Most of the varieties are well known. Of Whites, for instance, Butterfly we have seen again and again acquitting itself with credit; its flowers are very showy. The "Giant" White is of another character, its flowers are more regular, prim, and proper, but equally good. Then there are strains to colour, such as Rose, Cherry Red, Crimson, Purple, Pink, &c. But surpassing all of these latter in distinctness are the varieties Vulcan, an exceedingly rich crimson; and Salmon Queen, a Cyclamen that may be identified in any collection possessing the variety. We have not seen another so distinct a Cyclamen of this colour. Messrs. Sutton & Sons are very satisfied that they have just acquired giant forms of these two varieties, but we suppose they will not be ready for distribution at present. Each of them, though excellent in colour, has needed rather a stronger habit, larger flowers, and stems that would carry them well above the foliage.

We can hardly conclude such a note as this without mentioning the enthusiasm of the late James Martin, under whose care these plants were for so long. Fortunately, Mr. McDonald, who has succeeded to the charge, had worked side by side with Martin for a great number of years.

ORCHID NOTES AND GLEANINGS.

LÆLIA ANCEPS AT ROSEFIELD.

IN Mr. De B. Crawshaw's gardens at Sevenoaks, so ably managed by his gardener, Mr. Sidney Cook, Odontoglossums have been the leading feature for some years, and the collection is rich in many specially-named varieties of *O. crispum* and other species. The whole of the plants in the four houses devoted to them are in very fine condition, and a large proportion of them are producing very strong flower-spikes, though but a few are yet in bloom. Some of the plants have been acquiring increased vigour for many years, one example of *Odontoglossum crispum*, for instance, since the year 1880. A noticeable feature about both the houses and the plants, and one which gives a clue to their successful culture, no doubt, is that all are kept scrupulously clean.

The second specialty at Rosefield, and the one which is making the best show of flowers at the present time, is *Lælia anceps*, and of that species there is a very interesting collection of named varieties. Some of the best of them form a pretty group at one end of a curved span-roofed house, which seems to suit the plants perfectly, though the greater part of the plants were still in bud at the time of writing.

For general garden purposes, no doubt the easily-procurable good ordinary type of coloured *Lælia anceps*, with the now plentiful white *L. anceps Stella* and *L. anceps Sanderiana*, are sufficient; they are free-flowering and showy, and answer most purposes. But to form a collection of many-named varieties is not an easy matter, as such forms often have to be increased by divisions from the original plant, and the difficulty of this is only known to those who have undertaken it.

The plants in Mr. Crawshaw's collection are in admirable condition, and well furnished with flower-spikes, but even in his skillful hands, not all the plants can be made to bloom. Several plants of one of the earliest of the importations of white *Lælia anceps* have never yet bloomed in this country, although those of other importations gave no trouble in that respect. The form alluded to, with its long, thin, Schomburgkia-like pseudo-bulbs, will no doubt be recognised by many growers who have had similar experience of it. In the centre of the group, side by side, are two very finely-coloured and related forms, viz., *L. anceps Chamberlainiana*, and *L. a. Crawshayana*. A

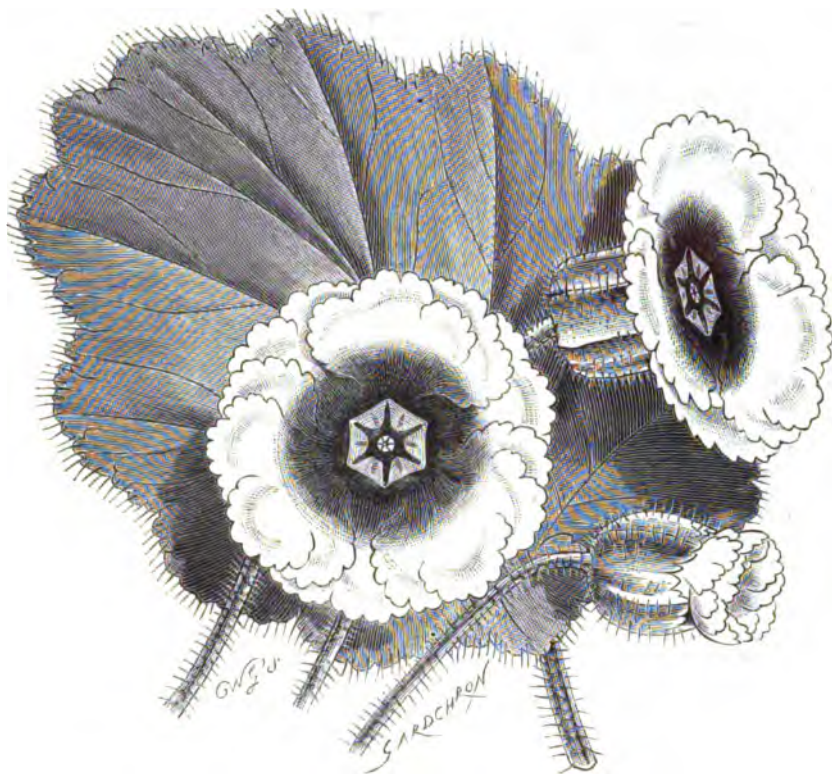

FIG. 21.—NEW PRIMULA, "THE DUCHESS": COLOUR WHITE, WITH DEEP ROSE CIRCLE AROUND YELLOW EYE.

The giant strains were not yet fully in flower, but there are giants in most of the colours, that is, varieties that are grosser in all their parts, but produce in consequence fewer leaves and fewer flowers than ordinary strains.

The "star" or "stellate" Primulas quite deserve recommendation. They are so free-blooming, and their graceful, branching, pyramidal habit gives to them much effect as winter-flowering plants for decoration. The flowers are only small, have no fimbriation, but merely a wedge-like notch in the centre of each petal, yet are the plants so bedecked with them, that they are exquisite to behold. There is the white form and a pink variety, and a recent lilac-tinted one. An improved white on very dark foliage was admired. In addition, there are varieties with new shades of colour, and others more or less intermediate between the type and the florists' varieties. The latter are the least satisfactory, because they forfeit the charming

command admiration. Several of these resembled greatly the Duchess itself, but were even more delicate, the colour being softer. There were flowers of magenta colour, red, vermillion, and a purple or plum-blue, and generally the eye is yellow. The process of "selection" and "fixing" has to be applied to these, and the results should be most gratifying to lovers of the Primula. Among the novelties we should perhaps include General French, a semi-double variety, also given an Award of Merit by the Royal Horticultural Society on January 9; it represents the best crimson semi-double up to date, and is most vivid.

Contemporary with all the newer varieties, we noticed a fine batch of the old white single-flowered alba magnifica, very true in strain, and flowering with abundant freedom. The most useful, but rather dangerous, *P. obconica*, made another house very gay with its flowers of quite a different type.

glance reveals the main difference, for the former has a broader front lobe to the lip, while the hue of the latter is a slightly darker purple-crimson. Perhaps the best and most distinct is *L. a. Amesiana*, "Crawshaw's variety," illustrated in the *Gardeners' Chronicle*, January 22, 1898, p. 59, and which has always been much admired when shown. *L. a. Mrs. De B. Crawshaw* is a very handsome dark-coloured variety, characterised by its rich and almost entirely claret-crimson lip, in which but little yellow is visible at the base.

Among the white varieties in flower, two plants of the original *L. anceps alba*, one of the earliest albinos of typical *L. anceps*, appears to advantage, its white flowers with a yellow disc, and minus the dark markings on the side-lobes of the lip seen in other white forms rendering it quite distinct, and easily recognisable. Among others, *L. a. Stella* and *L. a. Sanderiana* are very effective; while of the rare things not in bloom were noted a plant of the true *L. a. blanda*, the best variety of *L. a. Hilliana*, with four spikes; *L. a. Rosefieldiense*, *L. a. Williamsiana*, a plant of *L. a. Dawsoni* from the original stock, and many other good forms. Arranged beside them were *Lælia albida*, with a pale yellow tint, and a very handsomely-coloured form of it near to *L. a. Stobartiana*, and some plants of *L. Jongheana* in bud. In the same house are a number of plants of *Cattleya Warscewiczii*, imported a good many years ago, and as yet unflowered, like the unproductive form of white *Lælia anceps* alluded to above.

Suspended on one side of the house are a number of hybrids, the result of interesting crosses with *Lælia anceps*, and representatives of other genera (in one case *Sophranitis grandiflora*). All of these somewhat closely resemble in growth *L. anceps*, as they have done in former crosses. Among other species in flower were some very pretty varieties of *Odontoglossum Rosii majus*, one with the inner halves of the petals densely spotted with dark rose spots, being specially distinct.

All the plants are in excellent health, and the rare varieties are equal in vigour to the ordinary and as yet unflowered forms.

MARKET GARDENING.

CODIÆUMS (CROTONS).

THESE are now largely grown for market-sale. In establishments where *Codiæums* are made a specialty of, their brightest colours are fully developed, and it is found that most varieties will withstand exposure, provided that they are not taken from a high temperature whilst the leaves are young and tender. We have seen *Codiæums* used with good effect in groups of *Chrysanthemums*, and although the association perhaps is not a perfect one, it is difficult to obtain bright foliage from greenhouse plants; and when the effect is desired for a short time only, it is not necessary to confine oneself to plants which would naturally grow in the same climate. *Codiæum* leaves are also very effective for use with cut flowers, and for a variety of such purposes. Those varieties that become a bright red colour are most valuable, but others that are bright yellow when highly coloured are much appreciated.

Culture.—The most important point in their cultivation is to secure strong, well coloured tops as cuttings. This can only be done by growing the stock plants under the most favourable conditions. They must be kept free from red-spider and thrips, and other insect pests. Frequent examination is necessary to prevent the plants from becoming infested before it is noticed. The bulk of the propagating may be done during the winter months, but it should not be confined to this period. The system of "mossing" is recommended, as much larger plants may be thus established. Cut the stem half through and split it a little way up, putting in a wedge to keep the halves apart; or, instead of cutting the stem, pierce it through with the point

of a sharp knife, and insert the wedge. Then bind it up with sphagnum-moss and sand, and keep it moist. Roots will be produced before very long, and the tops should then be removed and potted-up into a light sandy compost. Place them for a time in a close propagating-pit to become established. If such tops are taken at different intervals it will not weaken the stock-plants so much as taking them at one time. In the case of plants having a single stem, the tops should not be taken until a good length of hard stem can be left.

In taking cuttings, it is necessary to keep them fresh. They should be taken off and put into a close-pit, having a good bottom heat, with as little delay as possible. Young plants may be grown on in a high temperature, and afforded plenty of atmospheric moisture and exposure to the sun's rays, but after they have grown well a more moderate temperature and less moisture will enable the plants to finish off well. Although *Codiæums* in active growth delight in a high temperature, they will withstand cold much better than is generally supposed. During the autumn and early part of the winter, specimens may be kept tolerably cool. They will then start into growth much better in early spring.

Varieties.—It is hardly necessary to enumerate these. The older sorts, such as *Queen Victoria*, *Majesticum*, and *Evansianum*, are still among the best. *Mortfontainensis* and *Thomsonianum* are worth growing in large quantities, as they always colour well, and make good plants; the same may be said of *Countess*, *Lady Zetland*, and *Prince of Wales*. *Reidii* and *Emperor Alexander III.* are fine varieties for autumn use. For market work it is better to start with a limited number of reliable sorts, and those who take up their culture generally find opportunities for acquiring sorts most suited for their purposes. *A. H.*

MELONS.

Good Melons always command a ready sale in large towns during the summer and early autumn months, and especially so in London during the time Parliament is sitting. Sow the seed singly in 3-inch pots three-parts filled with fine loamy soil and short manure (free from worms), at the rate of three-parts of the former to one of the latter, covering the seed with a little of the same mixture. Stand the pots on a board placed on the hot-water pipes, and cover them with a few squares of glass, afterwards giving sufficient tepid water to keep the soil uniformly moist. This is necessary throughout the whole period of the plant's growth. When the plants appear through the soil, remove the glass and transfer them to a position near to the roof-glass, and a few days later top-dress with some of the same kind of warm compost as that in which the plants are growing, pressing this gently together, and being careful not to touch the stems. Good free-growing varieties which are noted for the size, handsome appearance, and fine quality of the fruit which they produce with perfect freedom under ordinary treatment, should be grown. *Carter's Earl's Favourite* and *Blenheim Orange* possess the above-mentioned qualities in a marked degree. This I say from a long experience in the culture of both varieties.

For the production of early Melons a lean-to house, facing due south or south-west, and efficiently ventilated, is undoubtedly the best, seeing that not any of the glass area is exposed to the biting north winds. However, I shall confine my remarks to low, span-roofed houses, this being the description of house generally erected by market gardeners. The glass and wood-work having been washed with soapy water, and the brick-work with hot lime-wash, proceed with the formation of the hillocks. These may be made at intervals of 2 feet and at 1 foot from the wall for the entire length of the house on either side of the central pathway. The mounds, or hillocks, should be about 15 inches deep and 2 feet wide at the base. The best soil at command should be employed as a rooting medium, and one-third or

more, of horse-droppings or peat-manure, according to the natural fertility of the soil. Lime-rubble may with advantage be added to the above-mentioned ingredients in the proportion of one-fifth of the whole, if easily obtainable. The compost should be warmed by putting it into the house or houses at least three days before being brought into contact with roots of the plants. When the little plants have made two or three rough leaves, they should be transferred one to each hillock, making the soil quite firm about them in planting, and afterwards affording tepid water to settle the soil. Put a small stick to each plant for support, and secure it to the first wire of the trellis. Do not stop the leading shoots until they have nearly reached the top wire of the trellis, the object being to obtain an equal set of fruit, and an even distribution of it over the plants. This may be achieved by pinching out the first flowers that show on the laterals proceeding from the base of the individual plants, and afterwards trained to the first set of wires. Thus treated, they will produce side shoots from the base of each leaf-stalk along the entire length of the stem, and in their production the latter will thicken considerably. Superfluous growths should, however, be pinched off at one joint from the main stem. Train the shoots forming the plants at about 15 inches from one another on either side anglewise, and when they have made two or three joints of growth, stop them. When the flowers are open, fertilise them in the ordinary way with the small (male) flowers about mid-day, when the pollen is dry. Stop the fruit-bearing shoots at one joint beyond the fruit, and when it can be seen beyond doubt which fruits are going to swell, remove all of the superfluous ones—leaving from five to seven of the best and most even-sized fruits upon each plant.

Seven fruits will be none too many for ordinarily strong-growing plants to ripen. All superfluous growths and flowers appearing after the fruits have begun to swell should be kept persistently pinched out, so as to avoid anything approaching crowding of the shoots, and needless exhaustion of the plants. Damp the plants over-head and the house generally with tepid water, morning and afternoon on bright days. Ventilate somewhat freely during favourable weather to secure short-jointed growth. As soon as the roots push through the sides of the hillocks, add a layer of the same kind of compost as that in which the plants are growing, a couple of inches thick, and continue to make such additions until the intervening spaces are filled to within an inch or so of the top of individual hillocks, thereby preventing the possibility of the stems of the plants and the soil immediately about them becoming too damp by the lodgment of water.

Very little moisture should be distributed in the house when the plants are in flower, or when the fruits are approaching maturity. A minimum night temperature of 65° to 70° should be aimed at, and 5° higher by day, with fire-heat, running the temperature up to 85° with sun-heat, air being given at this point when the fruits are swelling, running the temperature up to 90° or 95° when closing the house, and distributing plenty of tepid water over the plants, walls, and pathways, same time. Should aphid effect a lodgment on the plants, fumigate in the evening with XL-All vaporising compound. When the Melons have become nearly full-grown, they should be supported by two cross-bands of matting secured to the trellis. When the Melon crop has been taken, the house can be prepared for, and planted with, Tomatoes for a late crop. *H. W. Ward.*

THE ROSARY.

THE present is a good time to examine the Rose-bushes, and note any blanks caused by frost, old age, and so on. On looking over our own, I do not find so much harm from frost as was feared after the spell of very sharp weather experienced in December. The majority of the plants have well-matured wood,

and in many instances, especially among the Hybrid Chinas and Bourbons, the buds are pushing into growth. No time should be lost in completing the

of temperature so common at this season. Under glass there are insect pests to contend with as soon as the days commence to lengthen. Early measures

upon fine days, but let it be early, that the foliage may become fairly dry by night.

Very many growers afford too much ventilation to Roses when in early growth. Far better is it to regulate the temperature without this and so avoid draughts, which are certain to cause mildew, and more or less to check the growth at a most critical time.

Soils for Roses.—All lovers of the Rose would do well to get the little treatise upon *Soils for Roses*, issued by the National Rose Society; although this does not tell us just what is the best soil, it gives most valuable hints.

It may interest readers of the *Gardeners' Chronicle* to know that upon Christmas Day, quite a nice bunch of flowers of Reine Marie Henriette was cut from the open here. This is a grand old climber Rose, and when allowed to grow at will it is seldom out of flower from the end of May until sharp frosts arrive. The hips upon the hybrid seedling Briars are still most showy. In one warm corner, and where a few plants are used to hide a low building containing a steam-boiler, the Sweet Briar is bursting into leaf sufficiently to draw attention by its perfume. Seldom have the buds worked during the previous summer looked more promising than those in this neighbourhood at the present time. Whether upon the many varieties of dwarf stocks or standard Briars, it is the same. *A. Piper, Uckfield.*

THE ABYSSINIAN BANANA, MUSA ENSETE.

WE are indebted to the Director of Kew for the photograph of a bunch of fruits of *Musa Ensete*, reproduced in fig. 22. The plant has been represented in the pages of the *Gardeners' Chronicle* on several occasions, notably in 1881, vol. xv., p. 435; where two very fine specimens are shown in a view of Jamaica scenery; and in a supplement to the issue for December 8, 1894, where it is shown growing in the open air in the garden of Mr. Howard Fox, at Rose Hill, Falmouth. Flowering examples may now and then be seen in the houses at Kew. The bunch of fruits now figured was forwarded to Kew by a Covent Garden agent, who had received it from the Azores as a "peculiar Palm fruit, which might be obtained in quantity from that island." The diameter of the bunch was 12 inches. The fruits were not mature, consequently they did not contain the large seeds which this species generally produces abundantly. In this respect, and also in the fruit being coriaceous, dry, and inedible, *M. Ensete* differs from the Banana proper, *M. sapientum*. The soft inside of the "stem" (really the folding bases of the leaves), is, according to the traveller Bruce, the best of all vegetables. When boiled, it has the taste of the best new Wheat-bread not fully baked. Only the white "heart" of the stem is eaten; this is well boiled, eaten with milk or butter, and it is wholesome, nourishing, and easily digested. *M. Ensete* is a native of Abyssinia and equatorial Africa, but it is now widely distributed in the tropics. Young plants of it are used for summer effect in the London parks. According to the *Kew Bulletin*, the total weight of a single plant grown in the tropics is about a quarter of a ton.

SWEET PEAS.

THE first week in February is a suitable time to make sowings of Sweet Peas. The seeds may be sown to the number of five in a 3½-inch pot in sandy soil, placing the seed-pots in a cold glass-house. In some light soils and warm districts the seed may be sown in the month of November, but the gain by this early sowing is doubtful. The plant does not make much headway before April, and I fail to see the advantage of autumn sowing over that of sowing in pots in cold houses and frames.

The aim of the gardener should be to obtain plants 8 feet in height early in August. Some persons may think this an extraordinary height to

FIG. 22.—BUNCH OF FRUITS OF MUSA ENSETE.

planting in places where this has not yet been done.

Pot Roses should be pruned and brought under cover, not for forcing, but in order to preserve them from excessive wet and the extreme changes

against these are not only much easier, safer, and more effectual, but the necessity for using strong solutions of insecticides is avoided. Too often it happens that the remedies applied do almost as much harm as the insects. Use the syringe freely

wish Sweet Peas to grow to, but from experience I can say the higher they grow the better they flower, and we cannot have too much bloom from Sweet Peas. Now that varieties are so numerous, the correct method would appear to be to set out or sow in clumps, and by that means keep the varieties distinct from each other, not only for the sake of seed saving, but for a display also. When growing side by side, there is no fear of the varieties becoming mixed from inoculation by insects, as it is not possible for any insect to cross-fertilise varieties as in the case of many plants, owing to the development of the sexual organs prior to the expansion of the blooms.

There is no flower in the garden which is capable of affording such large returns for the amount of labour expended on it as the Sweet Pea, commencing, as it does, to unfold its blossoms in June, and given the right kind of treatment, continuing till checked by frost. A long season of steady uninterrupted growth is the chief point to aim at. In growing Sweet Peas there are three common mistakes which are made. First, the seed is sown much too thickly, in consequence of which the plants are so much crowded that continued vigorous growth is impossible. I like to see side shoots that extend to a length of 6 feet, then I am sure the plant is not lacking in vigour, and there will be a corresponding quantity of blossoms. The blooms should be furnished with 10 inches, or more, of stalk, and most of these carrying four blossoms. Another mistake, and a common one, is not to gather the blossoms. The harder the flowers are cut the more numerous they become, the flowering season being thereby extended; whereas, if few blossoms are cut, a full crop of seed-pods is the result, which, whilst they are maturing, rob the plant and bring flower-production to a standstill. Let the blossoms be removed frequently, and thus obtain a succession. The third mistake is to withhold water during spells of dry weather, when the plants should be in active growth. Some persons are apt to put the blame on an attack of mildew, but they forget how little they do to prevent such an attack. Drought at the roots is the common, and I might say, the only cause of mildew on Sweet Peas. Affording a mulch of half-rotten manure long before the mildew is discernible would be a step in the right direction, but too little attention is paid to the matter of mulching. Abundance of water at the roots, and occasional heavy applications of liquid manure are important matters.

By sowing the seeds in pots in cold frames at the time named, an early growth is obtained without incurring any trouble from slugs. When the pots are filled with roots let the plants be re-potted into small 32's, employing a compost consisting of two parts turfy loam, and one of half-decayed horse-manure; whenever the weather is suitable draw the lights off from the frame, so as to ensure stocky growth.

Early in the month of April strong plants 1 foot high will be provided, which, when set out in the open ground, will start into kindly growth forthwith. As a means of support nothing is better than untrimmed Pea-stakes, fixed perpendicularly alongside the plants soon after planting, in order that the tendrils may cling directly they are long enough. It is at this time that mulching is best carried out.

My note would not be complete without a selection of varieties. Like many other popular flowers, the varieties of Sweet Peas have increased so fast that a selection of the best is not easy, there being no fewer than 200 varieties in commerce. The following four dozen will give a good display if the cultural conditions are of the right kind, as they embrace the best of both old and new varieties.

In white-flowered varieties we have Sadie Burpee, Blanche Burpee, and Emily Henderson, all very fine sorts, possessing the points most desirable in a Sweet Pea. In blue, we have Countess of Cadogan and Navy Blue. In bluish, Mrs. Fitzgerald, Duchess of Sutherland, and Countess of Aberdeen. Claret-coloured sorts are well represented by Duke

of Westminster and Duke of Clarence. Creamy-white varieties are pleasing, and the best are Lemon Queen, Lady Beaconsfield, and Venus. Crimson is well represented by Salopian, Mars, and Firefly. Duke of Sutherland and Shazada afford desirable indigo tints. Telling varieties of lavender are found in Lady Grisell Hamilton, Lady Nina Balfour, and Countess of Radnor. Lady Skelmerdale and Colonist are representative of lilac tints. Of distinct magenta, Calypso, Othello, and Black Knight are recognised as being the best. The mauve-coloured Fascination is a desirable variety. The orange-coloured section has now become a large one, and Lady Mary Currie, Gorgeous, Countess of Powis, Chancellor, and Triumph are nice examples. In pink, we have Duchess of Westminster, Countess of Lathom, Hon. F. Bouverie, and Lovely, which are the cream of this tint. Monarch is a desirable purple-coloured variety. Varieties of rose colour are numerous. Lord Kenyon, Mrs. Dugdale, Prince of Wales, Splendour, and Apple Blossom are all first class. In scarlet, Prince Edward of York deserves extended cultivation. Striped varieties are numerous, but not so popular as some other types. Admirers of this class may choose with the surety of having something nice from Aurora, Mrs. Joseph Chamberlain, Duchess of York, Princess of Wales, and Senator. Yellow is a colour that has many admirers, especially if it be pure in tone. Queen Victoria gives blossoms large and in every way desirable; in fact it would be difficult to select a variety more pleasing in any colour. Cream of Brockhampton is an improvement upon Mrs. Eckford, itself desirable where numbers are required. E. M.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Peaches and Nectarines.—The advancement of the early house from the flowering to the growing stage will necessitate close attention to disbudding. But the young growths are the principal promoters of root action, and if these are removed in too great quantities a check may be given to the regular supply of sap to the young fruit. At the same time, a too large crop of growths has a tendency to rob the fruit of the necessary nourishment. Remove first a few of the strongest and worst-placed buds at the base of the shoots, allowing one on the upper side to remain to form a shoot for future bearing. The thinning out of young growths must be done at intervals of a few days. A few of these if growing in connection with well-placed fruits in the middle of the shoots, may be left till last, and then be shortened to two or three leaves with the thumb-nail. The strong tendency of the shortened shoots to draw sap will benefit the young fruit. In order that the trees may start cleanly, give them a thorough syringing, and fumigate with XL-All. A night temperature of 55°, with a rise of 5° by day, is quite sufficient at present. Succession-houses may be started as required to meet the demand, or retarded, if needs be, to meet any special occasion. Where new houses are ready for planting, the best tree, whether standard or dwarf, is one that has been lifted annually for three seasons before being taken under glass. This ensures a mass of fibrous roots, and subsequent fruitful growth. Reliable varieties for early forcing are:—Peaches: Amsden June, Alfred, and Hale's Early. Nectarines: Early Rivers, Précoce du Croncels, and Lord Napier. Mid-season Peaches: Crimson Gaiety, Grosse Mignonne, Royal George, Violette Hâtive, Dymond, and Bellegarde. Nectarines: Dryden, Violette Hâtive, Pine-apple, Humboldt, and Spenser. Late Peaches: Barrington, Nectarine Peach, Princess of Wales, Sea Eagle, Gladstone, and Lady Palmerston. Victoria is the best late Nectarine.

Strawberries.—The earliest plants will soon be in flower, and this is the only critical stage in forcing Strawberries. If the flower trusses are strong, and thrown well up above the crown of leaves, the prospect of a good set will be favourable. The Strawberry-blossom contains many stigmas, and these are not ready for pollination at one time, but

usually develop from the top of the fruit downwards. The failure to set one or more of these stigmas produces irregularity in the shape of the fruits. Remembering, also, that the flowers open in succession, it will be seen that much patience is required during the flowering period. The conditions most favourable to a perfect set are an elevated position on shelves near the glass, a moderately dry state at the roots, a liberal supply of fresh air free from cold currents, and a rather dry atmosphere. Advantage must be taken of fine days to distribute the pollen over the principal blossoms. This may be done with a very soft brush, and a wooden fan about a foot square with a strong handle is also useful to assist in the pollination of Strawberries. It is used as a whisk for creating a sharp movement of the air, and thus setting free the pollen. Temperatures of 50° to 55° by night, and 65° on sunny days, is sufficient for the trees whilst in flower. Introduce succession plants into warmth every fortnight.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

Stove Plants.—If the cleaning of plants (as previously advised) is finished, the potting of the various species of stove-plants should now be pushed on, a commencement being made with Marantas, Anthuriums, Alocasias, and other ornamental foliage plants. Specimens which have grown beyond a convenient size may be divided with more safety at this season than if the operation be deferred, as then the danger of the leaves being scorched and disfigured is very great. Each plant should be examined, and re-potted where this is found necessary, and top-dressed in others, removing as much of the old spent ball as possible without injury to the roots. Alocasias and Anthuriums succeed in a compost consisting of fibrous-peat one half, and hand-picked loam, with the dust shaken out one quarter; the remainder being made up with sphagnum-moss, silver-sand, and bone-meal. Marantas should be potted lightly in peat, leaf-mould, and a small quantity of loam, plenty of sand being incorporated with the whole. It is advisable to make warm all composts intended for use with stove-plants before use. Nepenthes do not require much rooting-space, success depending chiefly on atmospheric moisture. Remove with a pointed stick as much of the old material as possible, and replace it with Orchid-peat, live sphagnum-moss, and clean crocks. If any of the plants are getting leggy, let them be cut down to two or three leaves. Cuttings of Nepenthes strike freely if placed through the hole of an inverted 60-pot in a propagating frame, stood on cocoa-fibre refuse dust, or on sphagnum-moss, and frequently syringed. Whilst in this stage they should be syringed occasionally, and as soon as the roots are visible, the tops should be potted into 60's, the same kind of treatment being continued till they become established. Afterwards hang them near the roof.

Humeas seem to be coming into fashion again. The final potting of these plants may soon be carried out, using pots from 9 to 10 inches in diameter. A compost consisting of light fibrous loam, flaky leaf-mould, and sand suits the needs of the plants admirably. Keep the plants in a cool greenhouse, avoiding sudden changes of temperature.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucestershire.

Early Peas.—These may be easily grown under glass in hot-water pits or frames, if sufficient light is afforded to induce sturdy haulm. If sown in pots choose 8-inch ones, place a few crocks at the bottom, fill the pots for three-quarters of their depth with a mixture of fibrous loam, leaf-mould, and a small quantity of half-inch bones. The seeds may then be sown moderately thickly. The plants when 3 inches high may be left eight in a pot; the temperature by day at the commencement should be 55° and not exceed 60°, air being admitted in favourable weather. When the roots of the plants fill the soil, a top-dressing of the same materials should be afforded, and small, well sprayed Pea-sticks placed around the rim of the pot. When the pods are formed, occasional applications of liquid-manure will help them considerably. The varieties William Hurst, Chelsea Gem, and Early Sunrise, are of dwarf growth, succeeding admirably under pot culture.

Peas Out-of-doors.—For the earliest crops out-of-doors, Exonian, American Wonder, and Earliest-of-All, may now be sown to the number of twelve seeds in each 5-inch pot, and the latter placed in gentle heat till germination takes place, and then be shifted to a cool frame close to the glass. Ventilate the plants by degrees, admitting more and more air till the plants are 4 inches high, when planting-out may take place. The early crop of Peas should be taken from a border in the front of a south or west wall, which should be prepared by deep trenching and ridging, in order that it may be dried and pulverised by the sun and wind.

Cauliflowers.—Plants of Walcheren raised in September and pricked out into cold frames must be afforded free ventilation, or a check will follow the planting-out. In order to be prepared for a possible deficiency of plants, seeds of the varieties Extra Early Forcing and Early London may be sown forthwith in pans or seed-boxes, placing these in a gentle heat and near the glass. When the seedlings show the second leaf, prick them out into beds in pits and frames, in order to gain size and strength before planting them out-of-doors. These plants will then form heads of a moderate size by the end of the month of May.

Cabbages.—Beds planted in the autumn should have every vacancy in the lines planted up from the reserve or the seed-beds; and if the demand for Cabbages is large, seed of All Heart and Veitch's Earliest-of-All may now be sown, and the seedlings treated in the same manner as advised for Cauliflowers.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Rochester, Abbotbury Castle, Dorset.

The Dahlia.—Tubers of varieties selected for propagating may forthwith be placed in a warm-house, or on a hot-bed, being set fairly close together with cocoanut-fibre refuse or coarse leaf-soil packed round and over them, to a depth of from 3 inches. In whatever manner heat is afforded to start the tubers into growth, they should be afforded plenty of light from the moment they commence to put forth shoots. When a shoot has reached a length of 4 inches it is fit for making a cutting (a heel). Such cuttings may be inserted singly in pots filled with sandy soil, which may be plunged to the rim in a hot-bed frame having a warmth of 70° to 75°.

Cannas.—These useful plants should be got into growth early this month, potting them into rich soil, and affording good drainage. Plunge in mild bottom-heat, and on signs of root activity being noticed, afford tepid rain-water, increasing the quantity as the roots fill the soil. A suitable temperature is one of from 60° to 65°. Choice or new varieties may be now increased by division of the root, taking care that each piece is furnished with a bud. Choose pots to suit the size of the divisions. Plunge these in a hot-bed such as I have recommended for striking Dahlias. Afford water sparingly until a move is noticeable in the growth, when a little more may be applied; but much caution is needed at this stage, or decay will be set up in the rhizome.

Potting-plants.—Various kinds of soil may now be got in readiness for potting purposes; sifting light loam, leaf-mould, grit, &c., and mixing, and otherwise preparing the different composts, so as to suit the plants to be potted. Let pots of all the suitable sizes be washed or bought in, and let them be kept under cover. Pelargoniums which have been rooted in the usual sort of box must be potted before overcrowding weakens them; and in potting, the soil should be dry enough to allow of the soil being made firm without it sticking to the gardener's hands. The best soil is one of which two-year-old pasture-loam forms three-quarters of the whole. Not much hard drainage is required in the pots; one or two concave pieces, hollow side downwards, and a big pinch of roughish loam or dried horse-dung being enough. Rooted cuttings of Lobelia erinus in variety may in turn be potted, and replaced on shelves where they were rooted. These potted plants will in turn afford cuttings, which are very useful where large numbers are needed.

Echeveria secunda glauca, Mentha Pulegium, and Sedums which are pricked out thickly in slightly-warmed frames should have the lights drawn off the frames on bright days.

Seeds.—Weather permitting, a sowing may be

made of Sweet Peas, sowing thinly in lines. Seed^s of alpine plants may be sown in small plots, making the soil firm by patting it with the back of a spade. Cover with fish-netting raised above the soil, and set traps for mice.

Bedding Plants.—After foggy and wet weather let all kinds of plants be cleared of decaying leaves, affording plenty of air when the weather is not frosty. If the coal-ashes on which the plants are standing is very moist, replace it with fresh materials, and make use of the hot-water pipes during the day in conjunction with ventilation to drive out damp. Calceolarias, after clearing away decayed leaves, should have charcoal-dust strewn between the cuttings, in order to arrest decay. Verbenas, being subject to attacks of mildew, should be kept in a dry, warm house, near to the roof-glass, and if a dusting with sulphur be afforded in early morning the spread of mildew will be arrested.

General Remarks.—During mild weather coverings which were placed at the base of half-hardy plants may be partially removed in the warmer parts of the country, but in the colder parts there should be no hurry to remove anything yet.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Bush Plums.—The pruning of Plums is similar to that of the Apple and Pear, excepting that the young breast shoots and others left for forming fruit-spurs need less severe cutting back; at the same time they should not be left of any great length, or the bushes will become very dense with growths. Some gardeners leave a greater number of branches in the Plum than in the Apple, but this I consider to be mistaken practice, quite as heavy a crop of fruit, if not heavier, being obtained from bushes the branches of which are kept thin and the centres open. Bush Plums are more economical than standard trees, as the bushes may be planted at 9 feet apart each way. It is probable that to keep bushes fruitful root-pruning and lifting will have to be performed once or twice; but afterwards they bear well.

Pyramidal Apples, Pears, and Plums.—These require exactly the same treatment as bushes, with the proviso that the leading shoot must be retained for the extension in height in the case of young trees that have not reached their limit. These shoots should have the tips removed.

Maiden Trees.—Such of these as consist of a single shoot should be cut back to a point where there are five prominent buds, if they are to be trained as pyramids; whereas for forming bushes four buds will suffice, a leading shoot not being required.

Bush Cherries.—Culinary varieties, such as the Morello, Belle Magnifique, and Kentish, will simply need the shoots to be thinned out where crowded, the weakest wood being that first removed, afterwards taking out the remainder if the crown is still too dense. The use of nets in protecting the fruit of the Cherry is apt to cause the trees to assume a drooping habit of growth, and is a check on upward growth. Those who have but a small wall area at command should always adopt this method of growing the Morello and kindred varieties, for the trees may be planted at 6 feet apart, and will in a few years form a very fruitful hedge. Dessert varieties of the Cherry, if they were summer-pruned, will require only a shortening of such leading shoots and spurs as may have grown to too great a length. Dessert Cherries in bushes, in order to keep them healthy and vigorous, are better cultivated on the extension than the restrictive method.

Cleansing Trees and Bushes.—Pruning finished, spray the trees, &c., with the caustic soda in solution as previously recommended, before the borders are pointed over. Trees infested with American-blight should be well brushed on stems and branches with petroleum emulsion, and the roots laid bare for a yard or two; and if any of the insects are found, sprinkle with water to which petroleum has been added, at the rate of two fluid ounces to each gallon of water, or use strong soap suds instead. Remove the soil which has covered the roots and char it, replacing it with soil from the vegetable quarters, or with fresh loam. Trees covered with moss and lichen may be washed with caustic soda.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Masdevallias.—Orchids at this season begin to make slow growth, generally necessitating an examination of the roots and rooting material. Amongst the first to need attention are Masdevallias. To enumerate the varieties would occupy too much space here, and it will suffice to say that with few exceptions, viz., *M. tovarensis*, and those of the Chimara section, Masdevallias may now be resurfaced with fresh material, or repotted as the case may require. This, however, only applies to plants that need not be pulled apart when repotting them, for where such an operation is necessary, better results will be obtained if it be carried out later in the year. Small plants and others which require larger pots and pans to hold them in an unseparated state, may be safely repotted forthwith. The strong varieties as *M. Harryana*, *M. ignea*, *M. Veitchi*, &c., are suitably accommodated in pots; but *M. Shuttleworthi*, *M. muscosa*, *M. Wageri*, *M. tridactylites*, and others of a similar nature, thrive better when grown in suspended pans. Pots and pans should be three parts filled with clean crocks, and afterwards a compost consisting of one half of fine textured peat, and one half of clean living sphagnum, well incorporated with each other. Plants about to be repotted should have no water afforded them for a few days previously, in order that the stale materials may be picked out readily; and when the new is placed about their roots, the condition of the plant can be easily ascertained, and water afforded accordingly. For some considerable time a moist condition should be maintained, but prolonged saturation at this season causes the leaves to drop. It is seldom necessary to break the pots in order to detach the old compost from the roots, and the clean pots used should be proportionate in size to the plants. The material should be worked in evenly and made firm about the roots, but not pressed very hard, or elevated above the rim. Sand is often used with the compost, but excepting river-sand from unpolluted streams, it is of little value, and finely-broken crocks are better for securing porosity. For some time after repotting, a slight sprinkling of the surface will supply the plants with all the moisture they require.

Phalenopsis of all species, more especially those that have just flowered, should be given a short season of rest, by restricting the amount of water afforded, allowing a moderately low temperature, and a drier air. Soon after blooming, the oldest leaves turn yellow and fall away, and attempts are sometimes made to avert this by affording much moisture, and thereby, in my opinion, render them more susceptible to decay, rather than preventing it. As the sphagnum-moss will be replaced in a month or two, no attempt at keeping it alive should be made.

ALPINE GARDEN.

SAXIFRAGA APICULATA.

SOME large tufts have been covered with flowering spikes for some weeks. In southern gardens this is a somewhat unfortunate fact. Plants that are full of promise some weeks prior to Christmas do not always fulfil that promise. Many flowers were expanding early in December, but the severe frost was too much for the rather tender footstalks. Fortunately, *S. apiculata* is very free, and the more or less backward rosettes soon fill gaps made by the frost. To some extent, the tendency to flower early may be modified by giving the plants a shady position, whether planted in the rockery or in pots. The plants are very successful in such positions in summer, growing much more freely than in sunshine. This is better practice than giving any kind of protection to the advancing flowers, and much as the earliest flowers are appreciated, it is better to have them quite natural, if possible. The pale yellow blossoms of this kind make a good display, and in the open I have known them continue attractive for several weeks. The plant requires but a good ordinary soil, with plenty of grit in it, and succeeds in smoky London as well as elsewhere. *E. Jenkins.*

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR FEBRUARY.

MONDAY,	FEB. 5	{ National Chrysanthemum Society, Annual Meeting.
TUESDAY,	FEB. 13	{ Royal Horticultural Society's Committees Meet.
THURSDAY,	FEB. 15	{ Linnean Society Meeting.
THURSDAY,	FEB. 22	{ Annual Meeting of the Kew Guild: Manchester and North of England Orchid Society's Meeting.
TUESDAY,	FEB. 27	{ Royal Horticultural Society's Committees Meet.

SALES.

MONDAY, FEB. 5.—Hardy Perennials, Roses, Fruit-trees, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, FEB. 7.—Japanese Lilies, Palms, Greenhouse Plants, Azaleas, Roses, Hardy Border Plants &c., at Protheroe & Morris' Rooms.—Clearance Sale of Stove and Greenhouse Plants, Orchids, Garden-frames, &c., at Braddon Tor, Braddon Hill Road West, Torquay, by order of Captain W. Fane Tucker, by Protheroe & Morris, at 12.30 o'clock.

FRIDAY, FEB. 9.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39° F.

ACTUAL TEMPERATURES:—

LONDON.—January 31 (6 P.M.): Max. 41°; Min. 35°.

PROVINCES.—January 31 (6 P.M.): Max. 41°, Coast of Mayo; Min. 35°, Peterhead.

A German Exhibition of the Florists' Art. WE are informed by the President of the Committee, Dr. M. SCHMIDT-METZLER, that it is intended to hold a general exhibition of objects of the florists' art—cut blooms and articles used in the work of a florist—in the Palm Garden, Frankfort-on-the-Maine, on June 23, 24, and 25, 1900. The exhibition is the outcome of a desire on the part of professional and amateur patrons of the business, which has greatly increased as an industry in Germany as elsewhere, to afford the general public a collective idea of the florists' art of the present day, and of its capabilities. The exhibition will cover the entire area of the florists' industry, such as the decoration of saloons and apartments; the flowers and greenery necessary in carrying out different descriptions of decoration, baskets, china, glass, and other objects used in the work, being of German origin. Frankfort has long possessed a reputation for excellence in the florists' art, and it is hoped that an exhibition in that town will lead to an improved taste being displayed in other parts of the country. A large number of prizes in money, as well as gold and silver medals, will be awarded to competitors.

Horticulture and the Study of Nature. LAST week we touched upon the subject of rural education in this country, and on the day our article was printed, an influential deputation from the Agricultural Education Committee was received by the Duke of Devonshire in his capacity of Lord President of Council. The object of the deputation was nothing more nor less than to urge the taking over of the teaching work of the Board of Agriculture by the new Board of Education, which begins work next April.

The suggestion was made with a view to the introduction of such teaching as we dealt with last week into the village schools of this country. The necessity of appointing a number of specially-qualified inspectors to see that the instruction is properly carried out was emphatically brought forward at the same time.

The Duke of DEVONSHIRE, who expressed his agreement with the improvements desired, seemed to think that the success of their introduction depended altogether upon the manner in which the local bodies who deal with education took up the matter. When once the interest in the kind of teaching advocated became general, this might easily be carried out.

There can be no doubt as to the truth of what the Duke of DEVONSHIRE said, but there are a number of other things to be reckoned with. We have already pointed out how much depends upon the teachers themselves, who have to guide the children in the study of Nature, and upon their own training. One of the first pieces of work to be done, if rural subjects are to be efficiently taught, is to arrange for an organised system of normal classes at suitable centres for the instruction of our village schoolmasters and mistresses. There will, of course, be some little difficulty in finding a sufficient number of instructors of the right kind, and probably the only useful plan to adopt will be to give to a trained biologist the help of a practical man.

The selection of inspectors will also be by no means easy, for the proper men for the post should not only be field naturalists, but should combine a knowledge of modern methods of science teaching with the applications of biology to the cultivation of plants and the rearing of animals. With reference to the Duke of DEVONSHIRE's remarks as to the co-operation of the schools, it might not be amiss to see what evidence on the subject can be gleaned from the English Education Exhibition which has just been held. The fact may not have forced itself upon the ordinary visitor's mind, but a careful examination of the exhibits soon made manifest what a surprising number of teaching establishments in this country include some branch of Nature-study in their curricula. It would be out of place here to criticise academic teaching, except so far as the training of teachers is concerned. We need not say anything further about natural history in ordinary secondary schools than that it is usually scrappy, often only theoretical, and, to judge by the specimens exhibited, by no means taken seriously. The work that is of particular interest to us is the instruction in horticulture and botany in elementary schools and under County Councils.

By the Church of England Schools, under the heading of "Manual Instruction," photographs of school gardens at Freshwater and Stratton were exhibited. In the first case these were accompanied by note-books, and in the second by vegetables grown by the boys. The work of the British and Foreign Schools Society was represented by similar pictures of the school gardens at Boscombe. Note-books again were in evidence, with plans of the whole garden and a single plot; while a report dealt with gardening as a part of General as well as of Technical Instruction.

Granting that these schools are the only ones in the two series where horticultural instruction is given, the fact remains that work of the kind has already been begun in our country schools. Botany is a subject taught both in "British" and Wesleyan Schools, and seeing that the Board Schools in cities and big towns like

London, Leeds, Sheffield, and Brighton teach the same subject under difficulties, it should not be a hard matter to adopt a course of Nature-study in country establishments of a like constitution. Although it does not bear directly upon rural education, it would be a pity not to mention the fine exhibit of botanical material which, through the action of the authorities of the London parks, is now supplied to one hundred and forty London Board Schools. The metal cases, containing a fortnight's supply, were also to be seen, and seventy of these are despatched each week.

Very interesting were the note-books of the students in the day training-classes for elementary teachers at Owen's College. In these, a series of lessons had been drawn up for children of seven years old, dealing with a flower such as the Rose, or the Violet. The legendary, poetic, and artistic aspects were grouped together as "humanistic," while quite a number of others were rather broadly termed "scientific." With some slight modifications, such a series of lessons might well be arranged for country children.

We mentioned last week the training of school-masters and mistresses to teach rural science, under the auspices of county councils. The only evidences of the work of teachers so trained were included in the exhibit from Essex. The carefully-written and illustrated monographs prepared by the normal students each dealt with the minute structure, growth, and general life history of some one plant, and showed that in addition to theoretical knowledge, methods of manipulation, and of observing and recording facts, had been thoroughly mastered. When such original work is part of the test to be passed before a teaching certificate is gained, it is not likely that school lessons will be snatched from a text book, instead of being taken straight from Nature.

From the foregoing it will be seen that those who will be responsible for the success of rural education have some work already accomplished in this country to guide them. It is more than likely that a great deal more has been quietly going on than was to be judged from the Education Exhibition, for many branches of instruction were very badly represented.

Let us leave elementary education, and look how far those interested in horticulture took the trouble to show what systematic teaching of this subject is being carried on in England. The distribution of practical gardening schools, and the places where lectures and demonstrations had been given in Somersetshire, were shown on a map of the county by its Council. That of Essex exhibited both the "Science" and "Practice" note-books of first and second year's students in their horticultural school, as well as the year's prospectus of the latter. The position of Swanley College (aided by the Kent County Council) was shown on a map on the scale of four miles to the inch. Cheshire not being represented by any exhibit, no allusion was made to the horticultural side of Holmes Chapel College. In a portfolio were the "school garden schemes" of the Surrey County Council, but no evidence of the existence of the Practical School at the Botanic Gardens, Regent's Park (which is helped by the London County Council), could be found. Here again the only important exhibit came from Essex.

The chief Agricultural Schools were represented but very poorly as regards the results of their teaching work. The natural history specimens shown were in many cases poor, dirty, or devoid of any trace of the curator's skill.

THE HALL AT DEEPEDENE, NEAR DORKING.

VIEW OF THE ENTRANCE-HALL AT DEEPDENE (see Supplement).—In our issue for January 20 we referred at some length to the beautiful gardens attached to the Deepdene, Dorking, the residence of LILY, Duchess of Marlborough, and Lord WILLIAM BRESFORD. Our supplementary illustration this week is of a different character to the views then given, as it shows the interior of the entrance-hall of the residence. There are some very fine specimens of Palms at Deepdene, and in our illustration is shown what a beautiful effect may be obtained in dwelling-rooms by a skilful use of these graceful plants. There are few species of plants that lend themselves more fully than Palms for purposes of indoor decoration generally.

THE LATE DUKE OF TECK.—The death of H.H. the Duke of TECK creates a vacancy in the Presidency of the Royal Botanic Society.

R. D. BLACKMORE was a good cultivator and a practical man; we have seen him pruning his own Vines and fruit-trees. When fruit-growers were being lectured upon the necessity of selecting the best fruits only, of taking great pains with packing and other details of marketing, BLACKMORE once drew us aside with a curious smile to show us that what was being recommended was just what he had been doing for years. In these particulars he was like THOMAS RIVERS, who, however, was not so lenient to those who were presumptuous enough to think they could teach him how to grow fruit-trees. There is one trait in our friend's character that has not been alluded to, though the reader has but to look at the genial portrait we gave last week to see that a keen sense of humour was one of his most prominent characteristics. Those who were present at a certain conference on Vine diseases held at Chiswick some years ago, will remember the rich, rollicking humour with which he described a certain disease whose nature at that time was unknown. The way in which he criticised the plant-doctors with an imperturbable countenance, was one of the richest bits of fun we ever remember. Unfortunately the critic was no better but rather worse informed, but everyone enjoyed the fun nevertheless. Another characteristic of our lamented friend was his generosity. Several instances of this came under our notice. He could not say "No" when pain, or poverty, or distress appealed to him. It is possible his want of success as a business man may in a measure be attributed to this. Twice within our recollection the waggons in his yard were loaded and about to start for market, when a poor broken-hearted man, whose wife was dying of consumption, came and pleaded for some Strawberries, which were then at a high price. The man went off with the Strawberries, telling the writer of these lines that he felt ashamed to ask such a favour from Mr. BLACKMORE, as he had so often received similar kindness.

LINNEAN SOCIETY.—On the occasion of the meeting of January 18, 1900, Dr. A. GUNTHER, F.R.S., President, in the chair, Mr. GEO. MASSEE, F.L.S., read a paper on the origin of the Basidiomycetes. He remarked that Juel, a Danish mycologist, had recently demonstrated that *Stilbum vulgare*, hitherto regarded as a typical Hyphomycete, is a true Protobasidiomycete. Following up this hint, the majority of the species of *Stilbum*, some of which are the known conidial phase of species of *Sphaerostilbe*, and others existing without any known higher form, were examined, with the result that the conidial condition of *Sphaerostilbe microspora* and *S. gracilipes* proved to be identical in structure with *Stilbum vulgare*, in other words, true Protobasidiomycetes. This discovery reveals the fact that the conidial condition of an ascerigerous fungus may be a true Protobasidiomycete. Similar discoveries have been made with forms of *Tubercularia* and *Isaria* known to be the conidial stages of ascerigerous fungi. An exhibition of lantern-slides in illustration of Mr. MASSEE's remarks was deferred.

PERMANENCE OF HYBRIDS, CROSSES, AND GARDEN RACES GENERALLY.—Mr. IRWIN LYNCH, of Botanic Gardens, Cambridge, writes, "Having undertaken a lecture at a meeting of the Royal Horticultural Society, I should be very grateful to anyone who would kindly provide me with evidence and opinion, derived from their own experience, concerning the above. I am particularly interested in the reversion of hybrids to one of the parents. Does the garden *Viola* ever, in this way, lose its character when raised from seed? What good hybrids come true from seed (as is understood, for instance, of *Hippeastrum*), so far that identity, at least, is indefinitely preserved? My appeal is justified, I hope, by the possibility of receiving evidence which may support or weaken one side or other of present opinion, and so provide interest for the meeting. I may further be justified by the fact that, from different points of view, further evidence with regard to the behaviour of hybrids is much wanted."

COLOURING MATTERS IN FOOD.—The evidence given before the Departmental Committee inquiring into the use of preservatives and colouring matters in food, affords many indications of the prevalence of opinions based upon crochets and fads, as might have been expected; but it is more remarkable to find one of the learned members of the committee reported as betraying such want of acquaintance with the subject matter of his questions in regard to the preservation of the green colours of Peas, as to state, as a leading question, that "the object of the copper is, of course, to restore the colour of a faded Pea?" That was too much even for the witness—by the way, the President of the Society of Public Analysts—who discreetly replied, "No doubt it is to make it a good colour." But this answer was not sufficient for the examiner, who again asked, "But is it not a fact that the use of copper in Peas allows the substitution of a Pea which has gone 'off colour,' and which competes with a Pea that has been preserved by a somewhat better process, and which has retained its colour?" To which the witness, perhaps, with less discretion than before, replied, "I think it very probable; but I really do not know!" *Pharmaceutical Journal*.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.—The eleventh annual general meeting of the Cardiff and County Horticultural Society was held under the presidency of Mr. A. W. P. PIKE, on the 25th ult., when a goodly number of friends attended. Arrangements were made for the annual show to be held on July 18 and 19, subject to the usual permission for the use of the grounds from the Marquis of BUTE. The accounts for the past year's work were read and adopted. The officers for the current year are: President, The MAYOR; Chairman of Committee, Mr. S. MEDHURST; Vice-chairman, Mr. JOHN GRIMES; and Secretary, Mr. H. GILLET.

THE CARDIFF AND DISTRICT CHRYSANTHEMUM SOCIETY held their thirteenth annual general meeting on Friday, 26th ult., when between forty and fifty members attended. Mr. F. G. TRESEDER, who has occupied the position of Chairman of the committee for the past three years, resigned in consequence of press of business, and he was cordially thanked by the Society for the good work which he has done. Mr. JOHN HOWE was appointed in his place. Mr. GEORGE SHEWRING, Vice-chairman; and Mr. H. GILLET, Secretary. The date of the annual show was fixed for November 7 and 8.

FLOWERS IN SEASON.—We have been shown a collection of flowers representing strains of *Primula sinensis*, or Chinese Primrose, by Mr. W. BULL, New and Rare Plant Establishment, King's Road, Chelsea. The varieties are numerous, and include many charming and distinct colours. The flowers are of very satisfactory form, and most of them are beautifully fimbriated. Of so-called blues, much better than the old *cœrulea*, is one bearing the

name Imperial. A very fascinating pink variety is *Pink Countess*; it is fuller, larger, and more fimbriated than *Pink Beauty*, which is also pretty. Of crimsons, there are fulgens, and the newer *Comet*; the latter especially being very deep in colour and effective. The best carmine is one called *Mars*, and there are pretty white varieties with yellow centres in *alba* and *Avalanche*. *Albomaculata lutea* is the nearest approach to yellow; the centre is surrounded by rich Buttercup-yellow, which colours more than half of the length of the petals, the extreme outer margin being pale primrose. *Lilacina marmorata* and *carmines marmorata* present shades of lilac and carmine respectively. A reddish-purple is provided by *rubra* and *Sunshine*, each of which is very bright and pleasing in tint. There are semi-double varieties in white, pink, carmine, purple, and crimson.

THE NATIONAL CHRYSANTHEMUM SOCIETY.—The annual general meeting will take place at Carr's Restaurant, 265, Strand, W.C., on Monday next, February 5, at seven o'clock in the evening. In addition to the election of officers, and other routine business, certain alterations and amendments to the Rules will be considered. The following notice of motion has been given by Mr. THOMAS BEVAN: "That the election of the present General Secretary be postponed; and that an advertisement be inserted in the gardening papers for a properly qualified person to fill the post at a salary of £100 per annum."

PRESENTATION.—On Thursday night, Jan. 25, at Mr. J. CYPHER's nurseries, Mr. G. E. YEATMAN, one of the Service Company about to leave for South Africa, was presented with a silver-mounted meerschau-pipe, in case, and a pound tin of tobacco, subscribed for by his fellow-workmen (indoor department), with whom he has been connected for the last five years. The presentation was made by Mr. J. SKINNER, of the Orchid department, to which the recipient belonged.

TEA STATISTICS show a very marked increase in the Tea shipped from Calcutta during the present season, of which Australia and America took a proportionately larger quantity, more than setting off a decline in the Bombay requirements. From April 1 to date, shipments to Great Britain were 12½ per cent. in excess of 1898-99; 59 per cent. more was shipped to Australia; 10½ per cent. more to America. Bombay shows a decrease of 32 per cent., and sundry ports 1 per cent.

THE RAINFALL OF 1899.—The aggregate rainfall during the year just closed was deficient over the whole of England, the deficiency amounting to 6 inches in the Channel Islands, 5 inches in the south of England, and 4 inches in the east and south-west of England. There was a slight excess in most parts of Scotland and Ireland. The mean temperature for the year was in excess of the average over the whole area of the British Islands, the excess being greatest over the southern portion of the kingdom, although it was also very large in the north of Scotland. There was an excess of sunshine over the entire country, amounting to about 350 hours in the south of England, and exceeding 200 hours over the whole of England, except in the north-eastern district. In Ireland the excess was about 150 hours; but in parts of Scotland it was not so large.

FLAX CULTIVATION.—The annual returns relative to the cultivation of Flax in Ireland show a slightly increased quantity over previous years, although the additional area does not reach a thousand acres, the actual acreage this year has been 34,986, whilst the area of the previous year was 34,469; and bracketed in the same report are figures that reveal the enormous quantities of Flax which is imported, and of which the total cost to the country was three millions sterling, a fact which tells immensely against our merchants, and shows the want of sound scientific education combined with a practical training. It certainly is an opportunity the Irish Agricultural Board have to foster

and stimulate this almost languishing industry; whilst the commercial advantages which would necessarily accrue if its development was assured ought to be kept prominently in view. The annual loss of about three millions every year ought in itself to be a guarantee, even though it may be subjected to criticism from several standpoints, that the outlook is reassuring to the promoters whose aim is to engender a healthful activity amongst the agriculturists of the country.

THE ROYAL GARDENERS' ORPHAN FUND.—The usual monthly meeting of the committee was held on the 26th ult. A donation of £12 5s. was received from Mr. H. J. JONES, the receipts of a box placed in his Chrysanthemum-house at Lewis-ham. It was announced that the annual dinner would take place on Tuesday, May 8, at the Cafe Monico, Lord BATTESEA having kindly consented to preside; also, that the Richmond Horticultural Society would at their next summer exhibition set apart a tent for the sale of flowers on behalf of the Fund. Messrs. P. E. KAY and T. G. SWALES were nominated as members of the committee in the places of Mr. A. OUTRAM, deceased, and Mr. THOS. PEED, resigned. A draft report and financial statement was read, the latter showing an increase of £73 1s. 6d. over the receipts for 1898, and both were adopted for presentation at the annual general meeting on Friday, February 16.

EXHIBITION SCHEDULES TO HAND.—We have received from the following Societies copies of their schedules of prizes to be offered at forthcoming exhibitions:—

RICHMOND HORTICULTURAL SOCIETY.—The annual show to be held in the Old Deer Park, in the pretty suburb of Richmond, on June 27 and 28, will be a more important event than usual, owing to the visit there of the committees of the Royal Horticultural Society. In the schedule issued by the local committee, containing the regulations to be observed by exhibitors, and lists of prizes offered for competition, information is given respecting the arrangements made for the exhibits that will be entered under the auspices of the parent society. These instructions plainly indicate that there will be a meeting very similar in character to those held from time to time in the Drill Hall, Westminster. New or rare plants, flowers, fruits, or vegetables, may be shown for Certificates, and groups of the same will be rewarded by Medals, exactly as at Westminster. The Fruit, Floral, and Orchid Committees will meet at 11.30 A.M. on June 27, and there will be a meeting of the Council at 12.30 P.M. Exhibitors intending to stage groups would greatly assist the local committee by giving notice to the Secretary, R.H.S., as early as March 1, with an idea of the space that will be required. Groups may be entered as late as June 16, but their acceptance will be subject to there being space unapplied for previously. The plants must be on the ground by 9.30 A.M., and the staging must be completed by 10.30 A.M. All groups must be left for the second day of the show, and may not be removed till 7 P.M. on Thursday, 28th. At 10 A.M. Fellows of the R.H.S. will be admitted to the show; and at 1.30 P.M. there will be a luncheon, to which the Council of the R.H.S., and the members of the Fruit, Floral, and Orchid Committees, together with the local committee and judges, will be invited. The schedule of prizes offered by the local Society is a liberal one, and the numerous special prizes include a Challenge Cup, value 15 guineas, the gift of Mr. and Mrs. CHANCELLOR, for the best collection of forty-eight cut Roses. Richmond may be easily reached from any part of London, and there will doubtless be a good show, and a large number of visitors there in June. Any further information required may be obtained from the Hon. Sec., Mr. C. R. KING, 61 and 62, George Street, Richmond.

COUNTY BOROUGH OF HANLEY HORTICULTURAL FÊTE.—Following the example of Shrewsbury, Wolverhampton, and some other large towns, Hanley has held a horticultural fete in the Park belonging to the borough for several years past. Situated

almost in the centre of the Staffordshire potteries and a large population, it is not surprising that the show each year has increased in importance and extent. The forthcoming exhibition will be held on July 4 and 5, and the advance proof of schedule contains as many as 103 classes, for some of which very handsome prizes are offered. We can only mention very few of these. For a group of plants arranged for effect, a sum of £70 is offered in four prizes, the 1st and 2nd prize-winners to be awarded special prizes to the value of £5 and £2 2s. in addition. For a group of Orchids in bloom, £30 and special prizes are set apart; and for a group of Malmaison Carnations, £11. Upwards of £25 is offered in a class for a dinner-table decorated with flowers, foliage, and fruit; and numerous classes have been arranged for plants, cut flowers, fruits, and vegetables. There are sections for amateurs, and for cottagers. The nearest railway-station is Stoke-upon-Trent, and the horticultural Secretary is Mr. J. KENT, Hanley Park, Staffordshire.

ROYAL HORTICULTURAL SOCIETY OF SOUTHAMPTON.—The report for the past year, to be presented at the annual general meeting on February 22, is a satisfactory one. The summer show has been arranged for June 27 and 28, 1900; and the autumn show of Chrysanthemums, &c., for November 6 and 7. A satisfactory list of classes for each of these events is given in the schedule. The Hon. Sec. is Mr. C. S. FUDGE, Heckfield, New Alma Road, Southampton.

BURY AND WEST SUFFOLK HORTICULTURAL SOCIETY.—This Society holds one exhibition each year, for Chrysanthemums, fruit, vegetables, &c. The one for 1900 will take place in the Corn Exchange, Bury, on November 8 and 9, when a sum of £130 will be offered in prizes. The Hon. Sec. is Mr. W. NORTON, 7, Guildhall Street, Bury St. Edmund's.

THE QUINCE STOCK AND PEARS.—We read in *American Gardening* an account by a correspondent of that journal, of the behaviour of the Kieffer Pear when budded on the Quince stock. Ten years ago he budded this variety on the Quince and was surprised after getting two or three small crops to find the trees in a dying state. The stocks were found on examination to be quite thin, and the Pear stem quite thick; in fact, the stock was strangling the Pear. The writer replanted the trees deeply so as to get the point of union below the soil, and by that means obtained Pear-roots; he then cut away the original Quince stock and thus obtained trees on the Pear, which have done well ever since.

THYMO-CRESOL.—What do our readers know of this new and powerful disinfectant, germicide and fungicide? the use of which in the garden is strongly recommended by competent authorities for the destruction and extermination of plant-pests. It is said to be used by planters in India against red-spider, blight, &c.

BOOKS AND PUBLICATIONS RECEIVED.—*Moor und Alpenpflanzen und ihre Cultur im National Arboretum, und Alpengarten, Zoeschen bei Meran*: printed and published by E. Karras, at Halle, A. S. A useful and extensive list of heath and alpine plants grown for sale in the National Arboretum and Alpine Garden at Zoeschen. The list is furnished with columns for information, namely, native country, region or district; chief habitat, kind of soil best suited to the needs of the plant; aspect; growth; commercial value; and lastly, a marginal space for remarks in pen or pencil. —*List of Seeds offered by M. H. Corveon, of the Garden Alpin d'Acclimatation, Geneva*.—*Century Book of Gardening*, part 22.—*British Inventions*, vol. i., No. 1: A well and profusely illustrated journal, appearing weekly, appealing to those who are mechanics by trade, or have a taste for mechanical occupations.—*Queensland Agricultural Journal* for October, 1899, with descriptive notes on thirty-one native species of plants. Also papers on Viticulture, the Kei Apple, and Plants Poisonous to Stock: By F. Manson Bailey, F.L.S., Colonial Botanist.—*Annales Agronomiques*, tome xxvi., No. 1, January 25, 1900.—*Journal of the Society of Arts*, January 26, No. 2462, vol. xlviii.—*The Agricultural Journal*, Cape of Good Hope, No. 13, vol. xv.—*Bulletin of the Botanical Department, Jamaica*: Edited by W. Fawcett, F.L.S. Articles on Camphor, Mexican Sunflower, Mexican Tobacco, International Conference on Hybridisation, Drying-house, &c.—

Publications issued by Messrs. Sutton & Sons, Reading, viz., *How to make Tennis and Garden Lawns; Drainage of Lawns, preparatory work; Weed-seeds in Soil; Enriching the Soil; Selection of Seeds, and General Upkeep of Lawns; Short, pithy, practical instructions on an important subject. Lawns*, a larger work on the same subject, rather more fully treated and enriched by illustrations: Published by Simpkin, Marshall, Hamilton, Kent & Co., Ltd., London.—*Schedule of Prizes offered by the Massachusetts Horticultural Society for the year 1900*: Boston.—*Botanical Gazette*, No. 6, vol. xxviii., December, 1899.—*Proceedings of the Academy of Natural Sciences of Philadelphia*, Part II., April-September, 1899: Published at the Academy of N. S., Logan Square, Philadelphia.—*Mitteilungen der Deutschen Dendrologischen Gesellschaft*, No. 8, 1899.—*Kew Bulletin*, Appendix iv., 1899: Contents.—*Catalogue of the Library*. This instalment contains the additions made to the library during the year 1898, with the exception of such current periodicals and annuals as continue sets already catalogued.—*Delectus Seminum ex Horto Cantabrigiensi Academicæ ad mutam commutationem propositum*: Cambridge, University Press.—*Gartenflora*: No. for January 16, 1900.—*Plant List of the Royal Botanical Garden at Belgrade*: Tenth year.—*Flowering Plants*: by Anne Pratt, Vol. IV., Nos. 81 and 82.—*Home and Garden*: by Gertrude Jekyll, published by Longmans, Green & Co., 10s. 6d. net.—*Century Book of Gardening*.—*Queensland Agricultural Journal*: Vol. V., part 6, December, 1899.—*Notice sur l'Exposition Centennale et l'Exposition Contemporaine de 1900*, par A. De la Devanaye: Paris, Octave Dolin, Éditeur, 8, Place de l'Odéon.—*Pomus in Pom*: by Miss T. Tammes. An Account of an Apple Growing within an Apple; reprinted from the Proceedings of the Meeting of the Royal Academy of Science, Amsterdam, Saturday, Dec. 30, 1899.—*Japanese Botanical Magazine*, vol. xiii., No. 154.

VEGETABLES.

ONIONS SHOULD BE SOWN INDOORS.

THE practice of sowing the Onion-crop in the open ground will, I imagine, slowly but surely decline, till it becomes superseded by the superior method of raising the seedlings under glass, and transplanting them into the open quarters. It is impossible to conceive of anyone who has thereby gained immunity to the crop from the attack of maggots reverting to the ancient system. But immunity from that enemy is only one of the benefits that is thus obtained. The crop, as a crop, is increased to a very great extent, and what will perhaps be received with incredulity by some, the larger crop is produced with as little labour—possibly less than is required by the old system.

It has been assumed that transplanted Onions escape the Onion-fly, because when planted out the bulbs are already a certain size. That, to some extent, may be so, but two years ago our Onion-seed germinated so badly that a second sowing had to be made, and it was the beginning of March before this was done. To guard against failure, seeds were sown in the open on the same day that they were sown under glass. There was undoubtedly a difference in size in favour of the latter when they were transplanted, but hardly so much as to account for those raised in the open being destroyed almost to a plant, while very few of the others were much damaged.

The best time to sow for ordinary purposes is (in Scotland) in the first week of February, and in a recently-started viney the seeds will quickly germinate. As soon as the seedlings appear, remove them to a cool structure where growth will be slow and firm. As soon as the weather permits, the young seedlings should be taken out-of-doors, but given shelter, and, as soon as possible in April, have them transplanted into the quarter prepared for their reception. Not a few err in continuing the plants too long under glass; they make more growth, no doubt, but the less coddled plants in time outgrow them. Frost, it may be noted, does not injure the transplanted stock, and there is, therefore, no good reason why the period of preparation should be extended beyond the time necessary to produce a plant immune from maggot attack.

The one great difficulty I have experienced has been in ripening the bulbs. On that account it has been necessary to modify some parts of the treatment, and also to select suitable varieties. The practice of stimulating the crop, except by manures provided previous to planting, has been

discontinued. Large succulent and mild-flavoured Onions however cannot be produced except in soil in very high condition. Last year the best ripened bulbs were obtained from ground that had been heavily dressed with horse and cow manures for the last crop, and previous to planting was given only a dressing of superphosphate. It is not always possible to have ground so fitted for the

The question of varieties is not one of which can be produced Onions of the largest circumference, but which are the best for home use, and will so ripen under these altered conditions as to keep best. I have no better bulbs this year than those of James's Keeping. They are sufficiently large for culinary purposes, they ripened perfectly, and as a result have kept well. In addition to this or some

land (gr., Mr. Wm. Murray), by fertilising *Cypripedium Curtisii* with the pollen of *C. Sanderianum*, and which resulted in one of the finest garden hybrids of its class yet produced, the plant securing a First-class Certificate at the Royal Horticultural Society on January 23. The habit of the plant and the colour of its foliage resemble a light-coloured form of *C. Curtisii*, the dark-green markings on the light-green ground-colour being more obscure than is usual in that species. The lip and staminode are also strongly indicative of *C. Curtisii*, but the upper sepals and petals more closely approach *C. Sanderianum*, than which, however, it is much showier. The upper sepal is greenish-white, with well-defined chocolate-purple lines; the petals are whitish-rose, with dark purple spots, and the lip and staminode reddish-rose, the former darker on the nervures. It seems to be a very strong grower and free flowerer.

BOOK NOTICE.

VEGETABLES FOR EXHIBITION AND HOME CONSUMPTION. By Edwin Beckett.

WE have in this quarto volume of 216 pages the well-digested experiences of an observant gardener and very successful exhibitor at the principal centres in the country, and one therefore calculated to afford sound advice on the various subjects of which he takes cognizance.

As befits, the subject of the preparation of the ground forms the first chapter, and it is handled in a manner which struck us as erring too much on the score of brevity—indeed, much more would be desirable.

The teaching of gardeners and amateurs to dig light land in the autumn is somewhat doubtful wisdom. On shallow, light soils, it is decidedly extravagant in practice, the winter rains and snow in their percolation through the soil carrying off much of the valuable constituents of the manures to the drains, and out of the reach of the roots of the plants. Moreover, the upper layer of some light soils becomes so dry in the spring that not enough moisture exists in it to allow of the proper germination of seeds or the support of young plants unaided by applications of water. His method of dealing with heavy and wet soils seems better suited to light ones, and *vice versa*. What the author has to say about deep-digging for the production of superior vegetables is worthy of note, although some practitioners would demur to the advice, "always insist on the bottom being brought to the top" in the matter of trenching. We know of some lands which, if this advice was followed, would be unworkable on the surface for several years, and very unfavourable to the growth of plants.

We should have liked to have observed fuller references to the value of artificial manures in the kitchen-garden. Having disposed of the preparation of the land, the author at once starts off with the cultural methods to be pursued with the vegetables most esteemed in this country, and their preparation for exhibition. Here he is *facile princeps*, and the information he has to convey is very valuable, whether the cultivator is an exhibitor, or desirous only of having vegetables of the highest quality. This superiority cannot, of course, be obtained without the expenditure of much labour, in preparation of the soil, in affording a variety of aids to growth, and in methods of sowing. Among the Cabbage tribe touched upon is *Couve Tronchuda*, a most delicious if rather tender Cabbage.

The chapter on Potatoes is admirable, and we were pleased to note the author's objection to the exhibition of very large Potatoes; and, doubtless, to their production in the garden, although he does not say as much. He is also no advocate of the cultivation in gardens of numerous varieties. His own selection of varieties is not large.

The book, in spite of sundry shortcomings, is

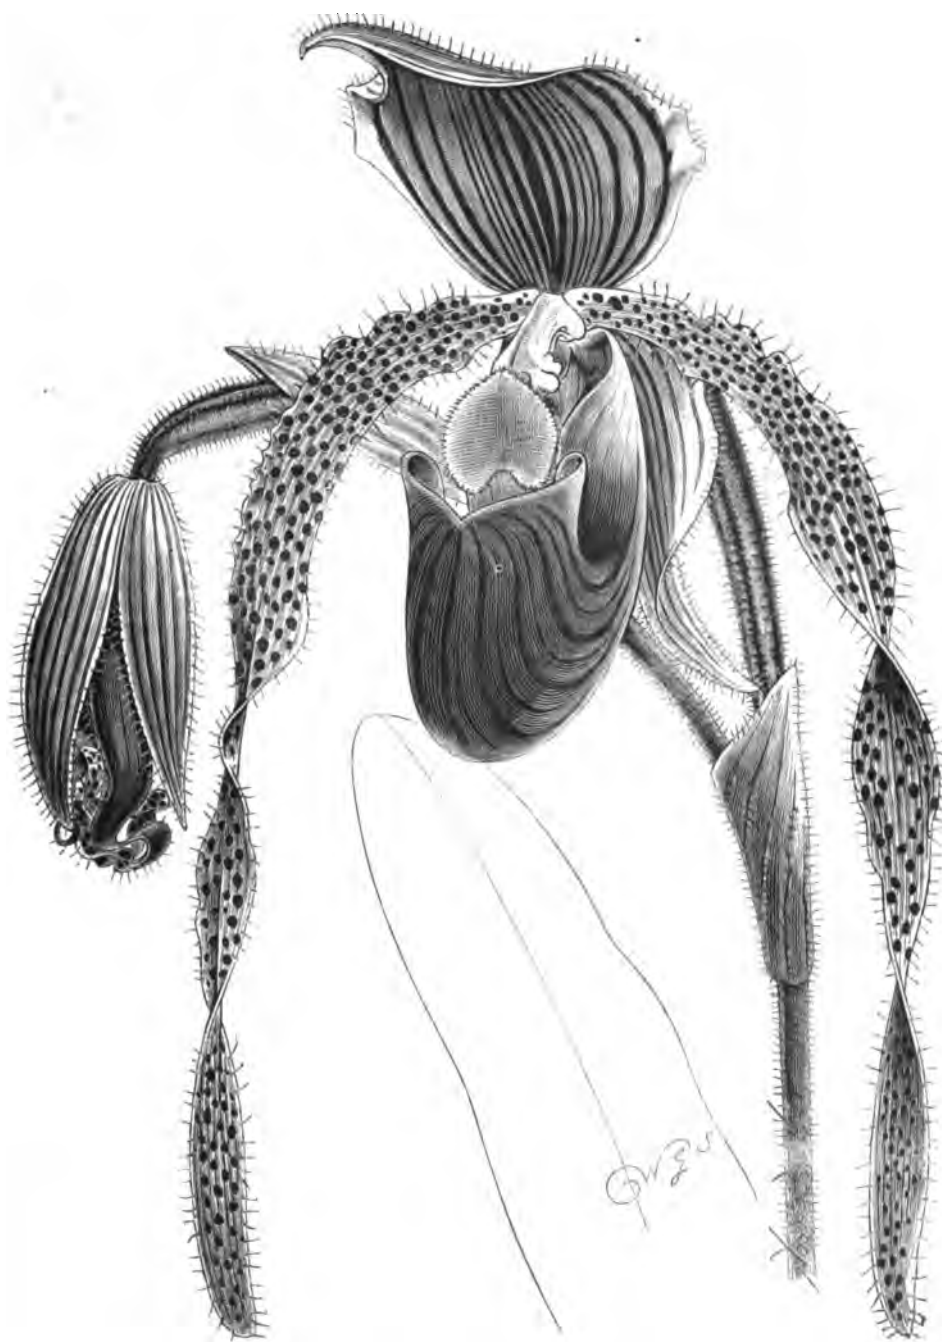

FIG. 23.—CYPRIPEDIUM × SANDERIANO-CURTISII.

purpose, but in any case it ought to be thoroughly pulverised by digging at least twice repeated, and the manure should be intimately incorporated with the soil. In addition, the soil should be compressed when dry as firmly as possible. There is no use in attempting to grow the crop so closely as by the old method. Fifteen inches—and perhaps better, 18 inches—between the lines, and not less than 6 inches between the plants, must be allowed. The summer routine consists wholly in surface-hoeing, repeated as often as circumstances will permit.

other variety equally valuable for spring use, one or more of the many large soft kinds for using in autumn and early winter should be cultivated. B.

CYPRIPEDIUM × SANDERIANO-CURTISII.

OUR illustration (fig. 23) represents the handsome hybrid *Cypripedium* obtained by Norman C. Cookson, Esq., Oakwood, Wylam, Northumber-

likely to meet the needs of the exhibitor and of the less ambitious cultivator alike, the information being sound and trustworthy. The pages abound in illustrations.

THE LATE JOHN RUSKIN.

I do not know how the death of Ruskin may affect others—it affected me almost as much as did Darwin's. In thoroughness of observation and exhaustiveness of research, these two profound students of Nature, and moulders and makers of science, resembled each other. Their combination of the most exact and acute observations with far-reaching and profound generalisation enabled the one to flood physical life with the light of evolution, and the other to illuminate the dark conventionalism of sterilised Art with the fascinating witchery of natural grace and beauty. With such a teacher and seer as Ruskin, the art of horticulture need no longer be hard or narrow. It is high time, and would be a fitting tribute to the life-work and genius of Ruskin, to break through our worship of formality in decoration and of crude masses of colour as now witnessed in many of our garden-landscapes and homes.

One longs to write of Ruskin as a gardener. This will probably be done by others. It will be easier to prove him a Master of the Gentle Art through his charming booklet, *Frondees Agrestes*, and opening almost at random we come upon a galaxy of gems at p. 125:

"Flowers seem intended for the solace of ordinary humanity; children love them; quiet, contented, ordinary people love them as they grow; luxurious disorderly people rejoice in them gathered, they are the cottager's treasure; and in the crowded town mark, as with a little broken fragment of rainbow, the windows of the workers in whose hearts rest the covenant of peace."

"Yet few people really care about flowers. Many indeed are fond of finding a new shape of blossom—caring for it as a child cares for a kaleidoscope; many also care for a fair service of flowers in the greenhouse, as for a fair service of plate on the table. Many are scientifically interested in them, and a few enjoy their gardens; but the blossoming time of the year being chiefly spring, I perceive it to be the mind of most people during that period to stay in towns. Passing through a valley in the Tyrol, near Landich, with a friend in the spring, a strange mountain was seen in the distance, belted about its heart with a zone of blue like our English Queen. Was it a blue cloud, a blue horizontal bar of the air that Titian breathed in youth, seen now far away, which mortal might never breathe again? Was it a mirage, a meteor? Would it stay to be approached? It was still ten miles. It was found not to be air, and did not vanish, but stayed patiently, expanding still into richer breath and heavenlier glow—a belt of Gentians."

"Perhaps few people have ever asked themselves why they admired Roses so much more than all other flowers. If they consider, they will find first that red is in a delicately graduated state, the loveliest of all pure colours; and secondly, that in the Rose there is no shadow except what is composed of colour. All its shadows are fuller in colour, owing to the translucency and reflective power of the leaves. Consider also the commonest forms of volatile substances, the invisible particles which cause the scent of a Rose-leaf, how minute, how multitudinous, passing richly away into the air continually."

We pass by his matchless description of the beauty of a fresh snow-drift, under the warm light of the clear mountain air, with the Alpine Soldanella venturing through, in language as true as it is vivid, a pensive, slender, fragile flower, whose small, dark, purple-fringed bells hang down and shudder over the icy cleft that it has chosen, as if partly wondering at its own recent grave, and partly dying of very fatigue after its hard-won victory.

If any reader can still doubt that our great

genius and poet had the head and heart of one of our first gardeners, let him sit at his feet a few minutes more and hear what he has to say about the grasses:—

"Minute, granular, feathery seed-vessels, mingling quaint brown punctuation and dusty tremors of dancing grain with the bloom of the nearer fields, and casting softness of filmy mist along their substances far away; mysterious ones move—not only with dew in the mornings, or mirage at noon, but with the shaking threads of fine arborescence, each a little belfry of grain-bells all a-chime. There seems little or nothing of notable goodness or beauty, very little strength, and very little tallness, and a few delicate long lines meeting in a point."

"The fields follow. All spring and summer is in them; the walks by silent, scented paths; the rests in noonday heat; the cry of birds and flocks; the power of all shepherd life and meditation; the life of sunlight upon the world falling in emerald streaks, and soft blue shadows, where also it would have struck upon the dark mould or scorching dust; pastures beside the pacing brooks, soft banks and knolls of lonely hills; thymy slopes of down overlooked by the blue line of lifted sea; crisp lawns, all dim with early dew, or smooth in evening warmth of barred sunshine, dented by happy feet, and softening in their fall the sound of loving voices, are summed by the simple words of meadow sweetness—Shakespeare's peculiar joy."

Little wonder that when such master-gardener, poet, and seer, is struck down, that even the daily press, in the crisis of the South African War, makes space to note the grandeur of his life, and the greatness and goodness of his work.

The *Scotsman*, of January 22, remarks: "Ruskin led the revival into the realm of art. He awoke the nation to a new and finer sense of the true and beautiful in form and colour. He shook the national taste out of its bondage and convention, purged it of its vulgarity, and taught the people to see and appreciate the beautiful. The revolution in taste that has taken place within the last fifty years has not been wholly his work, but he began it and inspired it; and even those who do refuse to acknowledge him as a master, are the fruit of the stimulus which he gave to the love of art and the sense of beauty." Thus closes its notice of Ruskin.

He wrote with all the exquisite clarity, and often much of the vehemence of the mountain streams, which he loved. To read him is to be infinitely refreshed, and to be filled with a new sense of the loveliness of the English language. Nor is it possible to foresee a time in the history of our literature when these qualities will not suffice to keep for him a place among the immortals. D. T. Fish.

Obituary.

JAMES FRASER.—In all probability the father of Scotch gardeners has passed away in the person of the late Mr. James Fraser, gardener, who died at Castlehill, Turriff, on the 18th ult., aged ninety-eight years. Mr. Fraser was engaged by the late Dr. Adam, as gardener at Ardmiddle House, Turriff, in the year of the disruption, 1843, and for the long period of thirty-three years he conducted gardening operations at Ardmiddle with great acceptance by his employers.

The gardens and grounds at Ardmiddle saw many improvements carried out under Mr. Fraser's management, and during his long engagement he served three generations of the family. It was with great regret that the late Mr. Milne parted with his faithful and trusted servant twenty-five years ago, when Mr. Fraser retired from active duty, and took up his residence in Turriff, which just now, by his death, mourns the loss of its oldest inhabitant. Mr. Fraser was a pawky, shrewd, typical Scotchman, and a thorough gardener.

Locally, Mr. Fraser enjoyed a reputation as being an authority on all matters connected with horticulture, and in his day few could out-do him in the

art of growing good vegetables and hardy fruits; while from personal remembrances I can speak of him as an expert in the cultivation of Strawberries, Melons, and Cucumbers. The immediate cause of Mr. Fraser's death was a sharp attack of influenza. John Mackinnon, Terregles, Dumfries, N.B.

CHARLES TURNER.—We regret to announce the death of Mr. Charles Turner, head-gardener for eight years to Hatfield Harter, Esq., the present proprietor of Cranfield Court, Bletchley, and his predecessor, the late Rev. G. G. Harter. He passed away on Monday, January 15, at Cranfield Court Gardens, at the age of sixty-six years. The deceased began his gardening career in the gardens of Blenheim Palace, where he became foreman; he went then to Middleton Park, Cirencester, and afterwards to Gunnersbury Park, and the Crystal Palace Gardens.

HOME CORRESPONDENCE.

SALE OF HORTICULTURAL POISON.—Whilst it is evident that the use of weed-killers, vapours, and other very potent poisons will still go on in gardens, as they seem to have now become indispensable, yet the law concerning them as manifested in several legal decisions, seems to be so singularly uncertain that it is very essential for the welfare of the trade concerned in the sale of these substances that some defined and authoritative decision should soon be given on the matter. The nature of that decision, when furnished by some Superior Court, seems likely to be found in that given in the Court of Queen's Bench in the Worcester case, and reported on p. 41. Here, at least, it is shown that any person, seedsman, or otherwise, may become the intermediary between the purchaser and the vendor, so far as the passing of the poisonous compounds are concerned, but may not be the actual vendor. That is not an unreasonable arrangement. Doubtless many rightly-thinking persons will hold that the manufacture of these dangerous compounds should be in the hands of certificated chemists. But once in their ordinary vessels or receptacles, where they are, whilst still enclosed, as safe as gunpowder is, similarly enclosed, it cannot matter whether they be dispensed through any ordinary person or agent, or through a certificated chemist. Thousands of cases have occurred of death resulting from poisons obtained from chemists; but I have not heard of one resulting from horticultural poisons. This view, which was that of the Court of Queen's Bench, seems also to be that of the Lord Advocate of Scotland. It would, then, be only needful, for any seedsman or sundries trader to describe himself as agent for such and such compounds; and orders sent through him by gardeners or others, for use in gardens, or other proper purposes, could be met without troubling chemists, or offending against the law. A. D.

COMET RED CURRANT.—Mr. A. H. Pearson, in his paper on "The Fruit Crops of the Year," which was published in the *Gardeners' Chronicle*, maintains that Comet and the Red Versailles Currants are identically the same. Your correspondent, "A. D.," in the *Gardeners' Chronicle* for December 16 last, also states this to be his opinion, and he suggested that others who have fruited it should come forward and give their experience. We have hoped that others interested would give their views of the variety, in order to settle this disputed point. We ourselves, in common with many others here in the United States, would like to know whether we are increasing for distribution a new or an old variety, which, however so good and desirable, ought not to be brought forward as a superior new sort if such is not the case. John Charlton & Sons, Rochester, N.Y. [Your own experiment with this Currant will be most likely to convince you one way or the other. Ed.]

THE BROAD-LEAVED DOCK OR DOCKAN.—This well-known plant is one of the most troublesome weeds with which the farmer has to contend. It grows in pastures, by waysides, in yards, and neglected gardens, but prefers cultivated soil. It is refused by cattle, but it is said to be eaten by fallow deer with such avidity that it is rare to see a Dock growing in a deer park. The leaves are often used in Scotland for wrapping round butter and cream-cheese; hence in some places the plant has the name of "Butter-dock." Most of us have applied it when pained by the sting of a Nettle. The expressed juice of the Honeysuckle is, however, a far more efficacious remedy against the sting either of plant or insect than the Dock-leaf, the sole virtue of which seems to consist in its coolness. The root of the Dock is very astringent. It was formerly used by dyers. It is remarkable that the Dock never flourishes in poor soils. The following anecdote refers to this peculiarity. A farmer who took a small farm in the north, and entered it at the usual time of Whit-Sunday, observed that there was not a single Dock on his land. Anyone knowing the troublesome nature of this weed might have supposed that this was a source of congratulation. The farmer, however, better knew the nature of land and its weeds, and nine months after he had entered on his farm he called on his proprietor to inform him of his intention of quitting it. The landlord inquired the reason of this decision, as the tenant had as yet no opportunity of seeing what crop he could raise in the fields. "Sir," observed the farmer, "there was not a Dock on it at Whit-Sunday. I brought Dockans from different places and have planted them, but they have not answered at all, and I know that what will not grow Dockans will not grow Corn." *J. Kennedy, Roydon, Essex.* [In some parts of Switzerland the Dock leaves are dried and given also to the pigs in winter. A great deal of starchy food is contained in the seeds, which is allowed to go to waste. *Ed.*]

A GRAFTING PROBLEM.—The effect of the stock upon the scion is illustrated in an interesting manner in a grafting-process by Mr. George Inglefield, Tedworth, Marlborough, who a few years ago grafted Ribeton Pippin Apple on to Blenheim Orange. A few days since Mr. Inglefield sent me some samples of the Ribeton Pippins, and they appeared to justify his contention that the flesh of the Ribeton Pippin had changed to some extent in texture, having become softer, while the flavour might be said to be intermediate between the two varieties. Mr. Inglefield gathered but few Ribeton Pippins from the grafted tree this season, but they were alike, and the fruit certainly appeared to have undergone some transformation, but whether sufficient to constitute a distinct variety, remains to be seen. No doubt Mr. Inglefield will note the results another season, to ascertain if his conclusion that the stock has in this case materially affected the fruit of the scion. *R. D.*

EXHIBITING VIOLETS.—Our old friend, Mr. E. Bennett, can be hardly oblivious of the fact that Violets have been exhibited in bunches at various November shows, sometimes with success, sometimes otherwise. Probably the chief reason why classes for three or six bunches of these flowers are not popular with gardeners is, that to gather so many entails great sacrifice; whilst, wherever Violets are grown, they are in daily demand, and are therefore kept rather hard-gathered. Then exhibition committees give as a reason for not offering prizes freely that the flowers, owing to their small size and colour, make, after all, a poor show in November, especially if the light in the place is not good. Still, the great thing for what is advocated is to have a very plentiful supply of good flowers. The most likely form of class to attract competition with Violets would be that of one button-hole, and one ladies' spray of Violets only; or of a small hand-bouquet of a ground of Violets and any white flowers. *A. D.*

— I was pleased to read Mr. Bennett's remarks about Violets being included in schedules of Chrysanthemum societies. At the Royal Aquarium shows stands of Violets, especially of the larger-flowered varieties, would be very acceptable. I noted at the November Chrysanthemum exhibition at that place a small stand consisting of the principal varieties, which everyone admired. As Mr. Bennett suggests, the bunches of blooms should be set off with their own foliage; and plants should be shown as grown in pots. *F. Strong, High Grove, Middlesex.*

ROOT-PRUNING OF APPLES AND PEARS.—Notwithstanding that the advantages that under certain circumstances are to be obtained by root-pruning fruit-trees have been repeatedly insisted upon in the press, there are still many unfruitful trees that only need attention in this way to bring them into a fruitful condition. Perhaps the kind of trees that most need to be root-pruned are ordinary-sized bushes and pyramids of Apples and Pears. As soon as planted they have a tendency to send tap roots into the sub-soil, and this encourages strong growth, and consequently severe pruning. Thus gross unfruitful wood is produced and cut away at the expense of fruit spurs. The operation of root-pruning is best done immediately before the fall of the leaf, although it can be safely done in open weather at any time during the resting season. It should be carried out as follows. Expose the roots to within about 3 feet from the stem, or further, according to the size and age of the tree, and as the work proceeds shorten the strong ones by a clean upward cut inclined to their points. The fibrous roots should be carefully preserved. Next undermine the tree and sever the tap roots smoothly. The hole may then be firmly filled in, fresh soil in preference being used for the purpose, and as the work proceeds raise the ends of the strong roots, if deep in the soil, and spread out regularly the fibrous ones. Young trees may have all their strong roots shortened at one time. Those old enough to have filled their allotted space should, however, in order to avoid a severe check, be operated upon in two successive years, one half of the tree being attended to each season. We have had, owing to the character of our soil, ample experience of the value of root-pruning in necessary cases. The following remarks are of a few varieties of Apples grown as bushes of the ordinary size, which are not generally considered suitable for that purpose. In the autumn of 1897 we root-pruned thirteen Bramley's Seedling that had been planted four years previously; which had made very strong wood, and had filled their space, but produced very little fruit. The following season very little growth was made, but an abundance of fruit-buds were formed, and last year a very heavy crop of fruit resulted. In 1898 we treated in like manner seven Blenheim Orange, and five Gloria Mundi, which were in a similar condition to the Bramley's; and at the present time both varieties are abundantly furnished with flower-buds. I have selected these well-known kinds for description from several varieties of Apples and Pears that have been similarly treated. Advantageous as root-pruning is in some cases, it will not insure a crop the year succeeding the operation, as some of its advocates claim. At the earliest, its profitable results are not seen until the second year. *Thos. Coomber, Hendre Gardens, Monmouth.*

APPLE NEWTON WONDER.—The remarks of your correspondents are interesting, as the spotting appears to be the one bad point in the Apple mentioned. I have had five years' experience of its behaviour, and can testify to its good quality as a keeper; as a dessert and cooking Apple it has few equals, in my opinion. We have regularly had them in good condition in April. We have it on the Paradise stock, grown as espaliers; and also grafted on an old Crab stock. On both stocks it is a most regular and free cropper, but whilst the espaliers give us grand fruits, weighing up to 14 ounces, with about one-fourth of the fruits spotted, the grafted tree gives us smaller fruits abundantly, with no signs of spotting. Can the stock have anything to do with the disease? *G. A. R., Nottingham.*

THE INFLUENCE OF THE STOCK UPON WORKED VINES.—The Vine-grower always finds interest in the inarching, or bottle-grafting of his Vines, unlooked-for results, favourable or otherwise, often following the union. I once saw a vineery filled with varieties of Vines which became converted into a purely Muscat vineery by the act of inarching on to the laterals growing near the bottom of the rods Vines of a year old, the old rods being removed as fast as the inarched young Vines began to fruit. In this case it could be seen which were the better foster parents. Gros Maroc and Gros Colman made the best growth; and Lady Downes was the least satisfactory. I believe with Mr. Temple that Gros Guillaume makes a poor stock upon which to inarch another variety; moreover, it has so little merit that it is only found in large collections, or because the owner has a fancy for it. I remember

an instance of a scion of Muscat of Alexandria being worked on the Syrian, which afforded the singular result that the Muscat flavour was quite absent from the fruit borne by the scion, whilst all other characteristics were undisturbed. The flavour of the fruit was exactly that of the Syrian. Black Hamburg I have tasted of a very superior flavour when growing on a Vine of Mrs. Pince, the object of the union in this case being to change the character of the crop, and not to accentuate the quality. Gros Maroc, itself a strong grower, is sometimes rendered freer in fruiting by being worked on the Black Hamburg stock, as is also Gros Guillaume, which, on its own roots, is very shy, unless carefully pruned. *W. S.*

THE "HATFIELD" CURE FOR RED-SPIDER.—I have followed with some interest the correspondence that has appeared of late in the *Gardeners' Chronicle* upon this subject, because anything that can be proved capable of destroying red-spider without injury to Vine or fruit-trees would be a boon to all gardeners. Sulphur-fumes are no doubt powerful to annihilate insects when diffused by fire-heat [or slaking lime. *Ed.*], but they have the drawback that the slightest overdose destroys vegetation equally surely when the fumes are confined in a glasshouse. Mr. Norman does not say whether he moistens the sulphur before using it; so I take it, the dry sulphur is placed in the tins, and heated by the direct action of the flame from the spirit-lamp. I should have expected that it would have been safer from flaming if wetted, and the vapour given off jointly with steam; but as sulphur is not easily soluble in water, probably there would not be much gained by the addition of water. Would Mr. Norman advise ordinary flowers-of-sulphur, or another form of it? Sublimed sulphur is the best for applying to the hot-water pipes, being very effective and safer, though the fumes given off are less perceptible compared with the more commonly used article. No doubt, as the editorial footnote points out, the practice needs the most careful management, and further experiment and report from those who have thus proved its value and safety would be greatly valued by all those who have similar trouble to deal with. *W. S.*

BIRDS BUILDING IN SHRUBS ON WALLS.—In reply to Mr. Lynch's enquiry respecting the above, I may state there is a wall here about 16 feet in height facing the north, and about sixteen years ago it was suggested and desired by my employer to cover it with some evergreen to hide it from view. Having a quantity of young Laurel-plants of the common variety, we planted them at the foot of the wall and about 2 feet apart. The soil generally being in a moist condition, the Laurels in about five or six years reached the top of the wall. As they grew they were tied up with string, any superfluous shoots being cut away. The only pruning they had was the cutting off of the foreright shoots with a pair of *sécateurs* once a year, in March or April, being all that was required; a very even evergreen screen is presented, which looks well. The spurs at the present time stand out from 9 inches to a foot from the wall. Blackbirds and thrushes build their nests in the Laurels plentifully (rather too much so). The wag-tail's nest I have also found, with a young cuckoo for a tenant in it at midsummer. *A. Harding, Orton, Peterborough.*

THE GINKGO BILOBA.—The interesting note in the *Gardeners' Chronicle* of Dec. 23, must have given pleasure to all admirers of the Maiden-hair-tree, and the magnificent specimen then illustrated is worth going far to see. The Panahanger-tree is acknowledged to be one of the finest in the kingdom, and when first I saw it I was greatly surprised. It is a great pity that in most of our parks and gardens, whether in town or country, this noble tree is conspicuous by its absence. The Maiden-hair-tree is well adapted also for cultivation in large tubs and vases, and if these be draped with Vincas (Periwinkles), they are very ornamental for positions on the balcony and terraces. The tree, when grown in tubs, may be trained either as a pyramid or bush. It must be remembered, however, that the tree is deciduous. *George MacKinlay, West Park Gardens, Amptill.*

CHRYSANTHEMUM MADAME CARNOT.—It is understood that the crimson sport of this variety originated with Mr. F. Perkins, at Oxford, a son of Mr. F. Perkins, of Leamington, and that it

occurred upon a plant of the type, not one of its varieties. The transition from white to crimson naturally occasions an inquisitive interest amongst Chrysanthemum growers. *J. E. J.*

FLORISTS' FLOWERS.

TUBEROUS-ROOTED BEGONIAS.

Now is a good time to raise a stock of plants of these the most useful of florists' flowers, whether it be for the decoration of the greenhouse or for furnishing the flower-beds in summer. The raising of Begonias from seed is interesting, and the results surprising, especially when working with the best strains. For the flower garden it is well to grow the plants in batches of separate colours, as a better effect is then obtained. Sow the seed in well drained pans, filled with fine sandy soil, and covering the seed with sand lightly. Place over the pans sheets of glass, and cover with moss. A gentle and moist bottom heat in an even temperature of about 65° will suffice to give the plants an early and robust start. Directly the tiny seedlings show through the soil, remove the moss, and tilt the glass on one side so as to admit air.

The seed from Begonias is irregular in germination, and the seedlings are as irregular in growth. Directly any of the plants are large enough to handle, carefully lift them from the soil and prick them off into other pans or pots. Fill up the holes in the seed-pan with sand, so that other seedlings may not be injured. Give the plants a position quite near to the glass in the same temperature; water them carefully, and syringe them twice daily with tepid water. Shift them on into other pots or boxes as fast as the growth demands it. For bedding purposes, shallow boxes are the most economical. Maintain an even temperature until the plants are ready for hardening-off preparatory to going to the greenhouse or cold frames. Fluctuations of temperature, coupled with cold draughts will tend to cripple growth. Like all other succulent plants tuberous rooted Begonias require a steady uninterrupted growth. *E. Molyneux.*

SINGLE FLOWERED CHRYSANTHEMUMS.

The notes on p. 18 concerning this section of Chrysanthemums is marked by appreciation of such varieties. For fifteen years I have advocated their cultivation for exhibition and general purposes, feeling assured that they would be valued in the decoration of the greenhouse and dwelling, and as cut-flowers.

Many good gardeners who at that time poo-pooed their value, have now a friendly word to say for them, having doubtless realised their value. There is no section that is so well suited to the conveniences at the command of the amateur as single-flowered Chrysanthemums. No other plants afford so large a quantity of flowers, or occupy so small an amount of space, and certainly no other section lasts longer in bloom.

At one time there was an objection—and a reasonable one, too—to the somewhat dingy, washed-out shades of colour; now we find the brightest colours among them. I need merely to instance the varieties—Framfield Beauty, a rich crimson; King of Siam, crimson; Mr. F. W. Travers, Rev. Remfrey, Poinsettia, and Souvenir de Londres, all most brilliant in colouring. Even in neutral tints there is much variety; while pure white and rich yellows abound. Then as to form of flower, there are numerous types from which to choose. There are long Japanese-like florets, both thinly displayed, and also closely-arranged florets: the neatly-formed florists' type, in middle-sized blooms; and the small-flowered, prim, Daisy-like blossoms, as well as cupped and recurved forms. In fact, there is almost an infinite variety of form, size and colour of flowers, as well as much difference in habit.

In associating Chrysanthemums with other flowering-plants, those with single flowers harmonise the best, being light and graceful. Another

point in their favour, which cannot be advanced for any other section in the same degree, is the delicate perfume which some of them possess. Two or three plants of Mrs. Langtry, for example, are sufficient to perfume a good-sized greenhouse. Their cultivation is simple; there is no anxiety and worry about timing the plants to get the right buds, for all buds are right under ordinary treatment. Stout cuttings inserted in January, two in a pot, rooted and grown on together, once pinching out the point of growth, and afterwards allowing the growth uninterrupted freedom, is all that is required. Abundance of water, especially when the roots are restricted to small (7-inch) pots, as many plants may be, is, of course, a necessity. Extra early housing of the plants is not imperative, as the buds do not suffer nearly so much from night dews and light frosts as do varieties with thick-fleshed florets, as we find them in incurveds and Japanese. For growth against south, east, and west walls, single-flowered varieties have no equal for furnishing large quantities of blossom in the autumn. *E. Molyneux.*

CALVAT'S NOVELTIES OF CHRYSANTHEMUMS.

Many of the new catalogues of the French seedling raisers are already to hand, but the chief interest will undoubtedly centre itself on Mr. Calvat's novelties. These for some years past have given the best results both here and on the continent, and although he has now many rivals, there are but few of his own countrymen that can hope to compete with him, by virtue of the very exceptional strain he has secured.

It does not often happen that we can get a glimpse of continental novelties twelve months before they make their appearance here, but having seen a goodly number both in Paris and Lyons last year, a forecast of some of the best may be useful to the novelty-hunter in England.

Mr. Calvat's set for 1900 comprises twenty-nine varieties, and he has secured altogether twenty-five First-class Certificates for them, at Paris and at Lyons, which may be considered the chief head-centres on the continent for such awards.

To my taste, and regarding these novelties from the exhibition standpoint only, Mme. Adèle Cordonnier-Wibaux is an immense Japanese of a reddish-crimson reverse, and centre golden. Then comes M. O. de Meulenaere, a fine large-sized flower of incurving Japanese form, in colour a deep reddish-chestnut-crimson, with bright golden reverse. Very striking, too, is Mme. Alice Capitant, which has long narrow florets of a beautiful shade of white slightly tinted. Mme. L. Druz is another giant, its colour a deep apricot-yellow. Salomé is deep and globular; it has narrow florets, and colour is a very deep golden yellow. Mme. A. de Franqueville d'Orthal, rosy-salmon with golden reverse, is also an immense bloom. Marquis Visconti-Venosta, is of a deep lilac-mauve tint, with reverse of silvery pink. Mme. V. Delavier has very long florets, colour pale mauve. All these as shown are undoubtedly as promising as any we have had, and following these in order of merit, I should say that M. R. Gremer, M. R. du Meunie de Montchauveau, Mme. André Bénac, Mme. Pelerin Allatouche, Mme. Christian Nano, Mme. J. Steel, Mme. Avizard, and Mme. Philippe Roger will rank next, and their descriptions can be easily obtained from Mr. Calvat's catalogue.

The other novelties included in his new set for 1900 I have not seen, and must therefore leave them to speak for themselves later in the year. *C. Harman Payne.*

POTATO-GROWING EXPERIMENTS.—Among the experiments which have been carried out by the Nottingham University College for two years in succession are some very important ones on the effect of manures on Potatoes, and which were carried out at Althorpe in Lincolnshire. The plots were in each case one-sixth of an acre in extent, and were duplicated by trials on eight different varieties of Potatoes. In all, fourteen different combinations of manuring were tried, together

with an unmanured plot in each case. There were thus 120 plots, making 20 acres in all, devoted to the experiment. This is far more extensive, and on larger plots, than the generality of experiments. Taking the whole of the experiments, the best results were obtained by the use of 1½ cwt. of nitrate-of-soda, 1½ cwt. of sulphate-of-ammonia, and 6 cwt. of superphosphate-of-lime per acre. This gave a crop of 10 tons 9 cwt. 3 qrs. per acre, as against 8 tons 1 qr. per acre on the unmanured plot. The increase from the manuring was thus 2 tons 9 cwt. 3 qrs. per acre, which at 50s. per ton had a value of £6 4s. 6d. As the manures cost £2 1s. 6d., this gave the satisfactory profit of £4 3s. from their use. The next most profitable manure was 2 cwt. of nitrate-of-soda per acre. This gave a crop of 9 tons 16 cwt. 2 qrs., or 1 ton 16 cwt. 2 qrs. more than the unmanured plot. This increase of crop was worth £4 10s., and as the manure only cost 16s. 6d., there was a profit of £3 13s. 6d. per acre from its use. The smallest profit from any manuring resulted from the use of 3 cwt. of sulphate-of-ammonia and 3 cwt. of dissolved bones. This gave a crop of 9 tons 3 cwt. 3 qrs., an increase of 1 ton 3 cwt. 2 qrs. per acre over the unmanured plot, the value of the increase being £2 19s. As the manures cost £2 6s. 6d. per acre, the profit from their use was only 12s. 6d. It is well worthy of note that although last year was such a dry season, every one of the fourteen combinations of artificials left a profit from their use. *The Newcastle Daily Chronicle, January 19*

SOCIETIES.

MISCELLANEOUS.

Aberdeenshire Agricultural Research Association.

—The annual meeting of the Executive of this Association was held in the New Chemical Laboratory, Belmont Street, Aberdeen, on January 20. There was a large attendance, and Sir J. Clark, Bart., of Tillypronie, in the absence of the President, occupied the Chair.

Mr. Jamieson, Director of the Association, submitted the financial report for the year, which showed a deficiency of £35. This sum, it was explained by Mr. Jamieson, will be borne by him, thus leaving the Association in a position to start the experiments for this year without encumbrance. A most satisfactory increase in the number of subscribers was intimated. Mr. Jamieson then submitted his report of the experiments conducted during the past year.

The main inquiry engaging the attention of the Association at the present time is the cross-fertilisation of Oats by a natural method, which might be adopted with benefit on a large scale without any extra outlay.

The subordinate inquiries in the report refer to the "Permanence of Rye-grass," to the "Effect of Manure on Grass," to the experience of the "Ten Year Rotation," and the possibility and great advantage of keeping grasses down for seven years; to the treatment of "Old Pasture," to a "New Grass Recommended," and to "Catch Crops." The report was submitted by Mr. Jamieson, who strongly commended the work of the Association to the support of all interested in the cultivation of the land, and pleaded for more assistance being given to the work he was performing.

A prolonged discussion followed on the subjects under trial, which was taken part in by most of the members present, and the meeting concluded with a cordial vote of thanks to Sir John Clark for presiding.

Reading and District Gardeners'.—The members assembled in force on the 22nd inst., on the occasion of the annual tea and smoking concert, which took place in the Abbey Hall, lent by Messrs. Sutton & Sons. The President, Mr. C. B. Stevens, presided at the tea, which commenced at 6.30, the company including Mr. Leonard Sutton, Mr. M. H. F. Sutton, Messrs. Fry, Hinton, Macdonald, Cox (Chairman, Vice-Chairman, Treasurer, and Secretary), Burton (Bexley Heath), Pope (Chairman of the Wargrave Gardeners' Society), Trollope (Whitchurch), Botley (Maldenhead), Prince (Arboretum), Cretchley (Twynford), C. Townsend (Sandhurst), Chamberlain (Shinfield), Nicholls (Malden Eridge), Riggs, Fares (Caversham), Cox (Calcutt), Osborn (Three Crosses), and others. The tables and hall presented a bright and pleasing appearance, having been decorated under the supervision of Mr. Macdonald with foliage and flowering plants sent by Mr. J. Woolford, The Gardens, East Thorpe, and Messrs. Sutton. The Chairman presented to the winners the prizes won in the Essay competitions. At eight o'clock the smoking concert commenced, presided over by Mr. Leonard Sutton, which was the best ever held at these annual gatherings. During the evening Mr. Ketley recited Rudyard Kipling's poem "The Absent-Minded Beggar," and the sum of £2 5s. has been sent on to the local war fund.

—Chemical manures was the subject of a lecture delivered by Mr. F. W. E. SHRIVELL, of Thompson's Farm

Tonbridge, at the fortnightly meeting of this Society, on the 29th ult. The lecturer laid before the members the results of the various experiments carried out at Tonbridge during the past five years with chemical manures on vegetables and fruit crops, under the auspices of the Permanent Nitrate Committee, who wished to find out whether dung could be dispensed with altogether, relying solely on chemical manures. Six new members were elected.

Wargrave and District Gardeners'.—The annual meeting took place on January 17, when Mr. W. Pore presided over a good attendance. The officers and committee for the present year were elected, the annual report and balance-sheet presented and adopted, and the prizes and Certificates won by members last year distributed. Mr. Geo. Hatch, gr. to Sir John Edwards-Moss, Bart., Thamesfield, read a paper on "Vine Culture." He advocated three-quarter span houses facing south, with front and top ventilation, with a trellis not less than 16 inches from the glass. He dwelt on the careful construction of the border, and gave advice on the proper method of mixing the soil; also upon the time of planting, pruning, disbudding, propagating, the temperatures necessary at various stages of growth, and thinning.

Bristol and District Gardeners'.—The fortnightly meeting was held at St. John's Parish Room, Redland, on Thursday, 26th inst. Mr. C. Lock presided over a large attendance. A paper was read by a member from the Cardiff Gardeners' Association, Mr. J. Graham, under the title "Gleanings from a Horticultural Class." Mr. Graham dealt with a variety of subjects, all of great importance to gardeners such as soil and its constituents, bacteria, thermometers, dew and rain, laying out of pleasure-grounds, rockery formation, draining of land, plant diseases, &c. He dealt with the subjects in an able manner, affording much useful information. Mr. Graham strongly urged the formation of botany classes in connection with gardeners' associations; and claimed that a knowledge of theory was a great help to the gardener in his work, and pleaded for more sympathy between head gardeners and their assistants. He was cordially thanked for his attendance and lecture. An exhibit of much interest was provided by Mr. GRAHAM, who showed over fifty dried specimens of British plants, which attracted much attention. A motion of sympathy with the relatives of the late Canon Ansley was passed. The late Canon was a vice-president of the Association during his residence at Redland, and took a keen interest in the work from the time of its formation.

THE APIARY.

Temperature and Brood-rearing.—Question: Can it be possible that 100° of heat is required for brood-rearing? If I remember rightly, I read a few days ago that 100° is about the temperature the bees maintain inside the hive when rearing brood; and if the heat in the sun is greater than that, the bees, by fanning at the entrances, cause a current of air to pass through the hive so as not to allow the temperature of the hive to rise higher than this. It seems to me 100° is altogether too high, and that 80° to 85° is much more correct. Answer: I think I saw something similar to what the questioner alludes to in one of the bee papers, and this altogether with what he says, leads me to believe that but few have a correct idea regarding the degree of warmth in which the bees keep the eggs, larvae, pupæ, &c., during the time they are rearing their young. While Nature has so ordained that a good colony of bees can form a living hive, as it were, in which to rear their brood; yet brood-rearing is very largely dependent on the hive, and before I take into consideration the real subject touched upon by the questioner, I wish to say a few words regarding that part which the hive plays in this matter of brood-rearing. In spring weather the capacity of a hive to retain warmth, the same coming in close contact with the bees, has much to do with prolific brood-rearing and the securing of our bees in time for harvest. The more heat we can retain in the hives the more honey we can save, for all are aware that the "fuel" that the bees "burn" so as to raise the temperature of the cluster to where they desire it, is honey. Again, the more "fuel" (honey) the bees burn, the sooner their life wears away, for it takes an effort, even on the part of the bee, to keep the furnace (the bee) heated, and filled with fuel as fast as it is consumed. Hence we see the important bearing that a good warm hive has in advancing our interests in the spring. Why do I say "in the spring"? Because at that season of the year the temperature outside the hive is very much lower than that which is required by the bees to rear brood, especially during the night. If, as I saw in print not long ago, bees could rear brood with a temperature of only 60°, then there would not be so much need of a warm hive, for we have many spring days wherein the mercury goes

as high as and even higher than that. If those figures were correct, then our bees could rear brood in April and May, here in the north, to as good advantage as they do now in July and August. Then, if the temperature of brood rearing were only 80° to 85°, as our questioner seems to think, should the temperature run higher than this, would it not be unbearable by the brood? And if this is true, what would the bees do when the mercury stood about the "nineties" for days in succession, as we frequently have it even in this locality? Would it be possible for the bees by fanning the air to give a less degree of heat than that very air contained. Some years ago, having a desire to learn for a certainty of these things for myself, I began to experiment as follows:—I procured a self-registering thermometer, and placing it near the fire until it showed 125° to 130° of heat, I set the register, wrapped it in some heated cloths, and immediately placed it in the centre of a brood-nest of a medium-sized colony. This was on a very cool day, some time in the month of May—about the middle as nearly as I can remember; that night water was frozen so as to form ice nearly as thick as window-glass, the time being selected on purpose. The next day, about 2 o'clock, it had warmed the air enough, so that the bees were flying freely, when I took out the thermometer and found that the coldest point reached in the brood-nest during the cold night was 92°. Since then I have tried the same experiment on both strong and weak colonies. Although at no time did it freeze so hard as at the first trial, yet in no colony that was rearing brood successfully did I ever obtain a less degree than the one mentioned, while some of the stronger colonies gave a temperature of 95° on nights when there was some frost. *Expert.*

LAW NOTES.

AN ALLEGED LONG FIRM.

JOHN WILLIAM TAYLOR, book-maker, Newcastle-on-Tyne, was charged, at the Bedale Police Court, with obtaining by false pretences 2500 trees, value £15, from Messrs. Towler & Sons, Askew, Bedale, on December 8, 12, and 19. The prisoner on December 8 ordered 1000 small Fir-trees as Christmas-trees, 1000 on the 12th, and 500 on Dec. 19. On the note-paper he used was a heading printed "J. W. Taylor, fruit and vegetable salesman, Green Market, Newcastle-on-Tyne," with a telegraphic address, and this, Mr. Towler alleged, had led him to conclude that prisoner was in a large or wholesale business, and he therefore sent the trees. Evidence was called to show that prisoner had no shop in the Green Market, but occasionally he had a stall outside in Newgate Street, Newcastle. He was remanded to take his trial at Leeds Assizes.

CULTURAL MEMORANDA.

VINES FROM EYES.

If Vines are going to be raised from eyes, no time should be lost in making suitable preparations. Well-ripened shoots having been removed from the Vines, cut these into portions containing each a plump, healthy bud, severing the shoots with a sharp knife in a slanting direction half-inch above a bud or "eye," and $\frac{3}{4}$ -inch below. Having ready a number of 60-pots, clean, and with one crock over the hole, place in them a little rough loam, and afterwards some of the finer portions of a lightish loam, with a little mortar-rubble broken finely, and some decayed manure. Having filled the pots, press the pieces of Vine-shoots into the soil till the top of the bud is on a level with the surface, a pinch of sand being placed under the "eye," and also over it. For a week or ten days the pots may stand in a vinery that has been started for forcing, and then be plunged in a hotbed frame with a bottom heat of 80°, and a top-heat of 65° to 70°. The soil in the pots must be kept fairly moist, and in order to preserve moisture without there being the need to afford

water, moss may be placed on the surface until the buds begin to grow, when the moss must be removed. It is prudent to put in a greater number of eyes than are wanted, as some of the buds may fail to send up a shoot, even when the pots are well filled with roots. After the second growth has begun, the eyes may be repotted, using as a soil one that is a little heavier and richer. Do not over-pot the plants, or the soil may become sour before the roots have taken possession of it; neither should water be applied very freely. Put a small stick to each Vine, and secure it thereto; remove all side-shoots. The plants should be kept in a warm, moist atmosphere, and not receive any check. These young Vines, if grown freely, and not allowed to get pot-bound, will be fit for planting out in the months of April or May, and will make fine canes the first summer. For many years I used to grow Vines for fruiting early in pots, from eyes struck in the month of January, fruiting them the following year. The Black Hamburgh, Foster's Seedling, and Madresfield Court Muscat are the principal varieties on which to depend for early crops. At one time Madresfield Court Muscat was not so much thought of as now, owing to the tendency of the fruits to split at the last swelling; but with care this may be got over, and when well finished it is one of the best black Grapes that we possess. *H. Markham, Wrotham Park, Barnet.*

IRELAND.

THE DUBLIN MUSEUM.

ON Tuesday, January 16, Professor Johnson, D.Sc., gave a highly instructive lecture on seeds in the herbarium attached to the above. The discourse was given in the evening; and was well attended, especially by the members of the seed-trade (for whose special benefit it was designed), also by gardeners. He pointed out that the term seed was vague, when viewed from the standpoint of the seller, namely, it included more; and by a series of lantern-slides he showed how the botanical definition differed from their point of view. After which he dealt with the differences in appearance of the various seeds, and alluded to some types where the line of demarcation was very shadowy, as for example Rape and Swede-seed. The impurities of seeds was fairly well treated, and the lecturer gave several examples of adulteration that have been practised, of which, one extreme case was that of the inventive German who manufactured Clover-seed from stone, and foisted them on the market; also in grasses where cheaper seeds were mixed with those of a more expensive kind. He (the lecturer) expressed the hope that tests of seeds would become general, and that a guarantee of purity and correctness of name to be furnished to the buyer would shortly be in operation. The germination of seeds was referred to, and the lecturer quoted several experiments which were carried on to test the question of vitality, amongst which he quoted the work done by Sir W. T. Thiselton Dyer, who utilised Prof. Dewar's discovery of liquid air. He likewise showed the method of cleaning seeds as practised abroad, especially in the United States of America. After which he gave a practical display, and showed an incubator with seeds in process of development, and explained the method of working it; also arranged in one of the rooms a series of the Leitz dissecting microscope-stands, with slides illustrative of seeds of the Gramineæ, after which the lecture was brought to a close. *A. O'Neill.*

THE BULB GARDEN.

TIGRIDIA PAVONIA.

TIGRIDIAS are of easy culture, but require a rich and fairly porous soil. Like many allies of the Iridæ, they are most effective when planted in masses in the flower garden. The species under notice is

one of the best of the genus, bearing exquisite flowers of vivid colours in great profusion, and growing about 18 inches high. The gorgeous flowers are 5 inches across, and are borne well above the bright green Gladioli-like foliage. They are brilliant scarlet, spotted with crimson and purple. When the plants commence to flower, some blossoms will expand every morning, and each flower lasts but one day.

They should be planted in a sunny situation, and in soil that has been prepared by digging or trenching, and the application of a heavy dressing of farmyard manure. The month of April is a suitable time to plant them in the open. Some growers prefer to pot the bulbs in February, or early in March, and start them in a genial temperature under glass. The Tigridias are not sufficiently hardy to withstand our winters in midland and northern districts, and they must be lifted and stored as are Gladioli.

In warmer counties the bulbs may be allowed to remain in the ground if a covering of bracken or straw be afforded them. The only attention the plants need during their growth is to keep the soil clear of weeds, and afford water when necessary. Bulbs that will flower the same year as planted may be purchased at reasonable prices, but plants already in stock may be propagated by offsets or by seed. *H. T. M., Stoneleigh Gardens.*

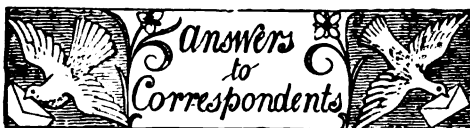

GALANTHUS ELWESII VAR. WHITTALI.

Chief among the newer Snowdrops is *Galanthus Whittali*. Although bearing a close resemblance to the well-known *G. Elwesii*, this variety has larger flowers, and is earlier; its foliage, also, is much broader and longer. As a proof of its early flowering, I may mention that although bulbs were planted in an exposed position, I gathered the first flowers from them on December 28, while those of *G. Elwesii* are only just (January 24) commencing to expand. The flowers are long and globular, and marked with three green spots at the base. Its tube, broad at the apex, is of a pale green tint, shading deeper towards the centre. The flower-stems generally exceed 12 inches in length. The broad leaves produced in pairs, are deep green in colour, and in length are about 12 inches. Its bulbs are among the largest of the genus. *E. S., Woking.*

SEEDS NOT TRUE TO NAME.—In reference to a paragraph from a correspondent, published in our last issue, p. 60, Messrs. HOWCROFT & WATKINS request us to print a letter, of which the following is an extract:—"Messrs. HOWCROFT & WATKINS resisted Mr. PERKINS' claim on two grounds, (1) that the seed supplied by them was true to name; (2) that they were protected by the usual 'non-guarantee clause' on the invoice. The action came on for trial before Mr. Justice CHANNELL on the 13th inst., when, after hearing the opening statement of counsel, his Lordship pointed out that it would take a considerable time to dispose of the first point, but that the second point was a short one, and he therefore proposed to decide it first, as if he should find it in favour of Messrs. HOWCROFT & WATKINS it would itself dispose of the whole case. The trial accordingly proceeded on this basis, and the judge having found in Messrs. HOWCROFT & WATKINS' favour upon the construction of the 'non-guarantee clause,' the other point was not gone into. If it had been, Messrs. HOWCROFT & WATKINS were and are prepared with cogent evidence to prove that the seed supplied as Clayworth Prize Celery was Clayworth Prize Celery and none other, having been tested in their own trial ground; and that they had sold a large quantity of it to a number of market growers, receiving from them great praise without a single complaint. In addition, Messrs. HOWCROFT & WATKINS were in a position to prove that Mr. PERKINS could not have been supplied with Celeriac by them."

COLD WATER v. WARM WATER FOR PLANTS.—Many gardeners hold that certain plants should

be afforded warm water, and they advance excellent reasons for the faith that is in them. But we learn from *American Gardening* that recent experiments at the Wisconsin Station have fully demonstrated the uselessness of warming water to be applied to plants through the soil. Many cuttings of Coleus, transplanted Tomato-plants, Beans, Radishes, and Lettuce, were used in the repeated experiments, the temperature of the water ranging from 32° to 100°. The plants receiving water at 32°—which is freezing-point—grew as well, and yielded as well, as those afforded water at 70° or 100°. "The soil about the roots of the plants so quickly regains its original temperature that no check to growth is likely to result." These tests were made in the greenhouse, and in the open ground ice-water was used in watering Beans and Radishes with results fully as good as when warm water was used. From the results of these and numerous other trials, the conclusion seems fully warranted that the growth of ordinary field and garden crops is not affected by the temperature of any water ordinarily available for irrigation purposes.

ADDRESS WANTED: *Dianthus, Leicestershire.* If you will send name and address, we will supply the information asked for.

BEANS: *Subscriber.* My opinion is that the roots having died and dried up, the stem-bases would naturally follow, and the plants wither. What caused the roots to die is not evident. It seems to have been a slow process, and might be due to treatment, root-insects, or root-fungi. The Botrytis which grew on dead parts might belong to a Sclerotinia disease, but there is no evidence to support this. The fact that other crops went wrong in the same house is suggestive. *W. G. S.*

CUCUMBER ROOTS. *D. D.* The roots are badly over-run with eel-worm, introduced in the pasture loam employed. There is no cure. Clear out the whole of the soil and the plants, and make a new start with soil from a new source. Loam should always be stacked for one and a half to two years, the stack being kept free of herbage.

DICTIONARY SUITABLE FOR SEED MERCHANT'S AND FLORIST'S SHOPMEN: *S. McG. The Dictionary of Gardening,* by G. Nicholson, and others published by Upcott Gill, 170, Strand, W.C.

DOUBLE-SPATHED RICHARDIA: *W. P.* These aberrations are of common occurrence, and are the result, usually, of extraordinary vigour in the plants.

FIGUS: *R. O.* The whitening of the margin of the leaf is not a disease, but the development of a sort of variegation. The variety is *Ficus elastica albo-variegata*.

FIG-TREE PRUNING: *Alba.* You will find pretty copious directions in *Gardeners' Chronicle* on p. 135, issue for March 4, 1899.

LIME ON TOMATO LAND: *R. F.* 1 lb. per square yard twice or thrice applied before and during growth.

MEALY-BUG IN VINERY: *Lamasine and Wanderling.* Remove the loose bark, especially that about the spurs, scrubbing the Vines carefully with hot-water and soft-soap, 4 ounces to 1 gallon of water. Then apply petroleum-emulsion or other suitable insecticide at the proper strength. Having done this, clean the interior thoroughly with hot soap-suds, and remove the soil 3 to 4 inches deep, doing this very carefully. Scrub the hot-water apparatus, more especially in the neighbourhood of the joints. If you hold with painting the Vines with a smothering-mixture of clay, cow-dung, and tar, the latter at the rate of half a pint to a bucketful of the paint, do this before there is the least movement of sap in the Vines. Give close attention to the Vines in the summer, using methylated spirits to kill solitary

bugs. The walls should be lime-washed, flowers-of-sulphur being incorporated in the wash. Do not permit pot-plants liable to attacks of mealy-bug to stand in the vinery. The bug will not be got rid of in one year, and the means indicated must be repeated for two or three years.

NAMES OF FRUITS: *Young Gardener.* We are sorry this answer has been delayed. 1, Harvey's Wiltshire Defiance; 2, Borsdörfer; 3, Norfolk Beeding. Next time please give your name and address, not necessarily for publication, but as a guarantee of good faith.—*W. T.* Very fine example of Beas Pool. The variety is a rather uncertain fruiter, but does occasionally bear heavy crops. We know several similar examples to yours.—*A. B.* The spotting in your Apples is certainly due to the fungus *Penicillium glaucum*, referred to in an answer to "T. H.," in our issue for January 20. The variety we take to be Ribston Pippin, but fresher specimens are needed to form a definite opinion upon. The Pear is also much past its best, and quite devoid of flavour; it is not the variety Broom-park.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Buller II.* *Cinerraria platanifolia*.—*A. M.* Variety of *Rhododendron Nobleum*.—*Old Subscriber.* *Cattleya Percivaliana*.—*E.* *Dendrobium Fierardi*.—*T. S., Devon.* *Schomburgkia crispata*.—*A. C. G.* 1, *Begonia Dregei*; 2, *B. fuchsoides*.—*J. K.* The double form of *Spiraea Cantoniensis*.

PITCH PINE: *Young Gardener.* The botanical name is *Pinus rigida* (Miller), syn. *P. Fraseri* (Loddiges).

PTERIS TREMULA: *W. G.* The fronds sent show nothing beyond a few parasites resembling mites. No fungus is to blame. Try the effects of XL-All, which is fatal to most insects affecting house plants, and is not injurious to Ferns.

PYRUS MALUS FLORIBUNDA: *Scrutator.* Increase is usually obtained by grafting or budding on the wilding-stock at the usual seasons for these operations, as also by cuttings of two-year-old wood made of a length of 10 to 12 inches and inserted in the soil up to the two upper buds.

RANK GROWTH IN TOMATO PLANTS: *R. F.* Too much nitrogen is in the soil. Trench it two or three spits, burying the top spit at the bottom of the trenches. If manure be wanted during growth, employ potash twice or thrice, 2 ounces to 1 square yard.

SALT AND TOMATOS: *R. F.* Do not use it with lime.

SULPHATE OF AMMONIA AND CUCUMBERS: *Nemo.* The first is a trade expression, and merely means some form of nitrogen. We are unable to give you a definite opinion as to the quantity you may apply to your soil, not having an analysis of the latter. Do you know if it is poor in nitrogen? We might say that an application of 2 ounces per square yard would be of use, and at any rate it would be a safe quantity. Is not what you term clubbing the consequence of eel-worms in the soil? Please send specimens of roots for examination.

VINE-ROOTS DYING: *J. W. M.* The death of the roots indicates a compacted, exhausted soil, and, probably, inefficient drainage, or the total lack of it. It is not too late to transplant the roots in the outside border, making the latter anew. Nothing else will be of any use.

YEAR OF INTRODUCTION OF RICHARDIA SPECIES: *Ca. S. B.* *R. Elliottiana*, 1890; *R. Pentlandi*, 1892, both from South Africa.

HONEY-GUIDES.

"HONEY-GUIDES," or "Path-finders," are terms, I think, attributable to Darwin. They consist of coloured streaks or spots on one or more petals directly over the position of the gland, and are characteristic of many irregular flowers. In regular flowers, which are visited from all sides, there are usually none of this nature, but in some flowers the bases of the petals may be of a different hue or colour from that of their main or basal colour. If, for example, the flower be red or blue, the base may be yellow, as in Primula, Forget-me-Not, &c., while the blue Anagallis œerulea has a scarlet base, like that of A. arvensis, from which it is derived.

Usually, the "guide" is a darker colour than that of the ground, as in Sweet Williams, some annual Chrysanthemums, Rudbeckias, Dianthus Heddewigi, Scarlet Poppies, &c. In irregular flowers, the special markings are located on one or more, but not on all the petals. They may be on the posterior side, as in Rhododendron (see fig. 24) and Tropæolum, or, more usually, on the anterior, as in Pansies, Mimulus, Calceolarias, Digitalis, &c.

The question arises, how are these differences of colour to be accounted for in one and the same flower? Taking the following sequence as being that accepted theoretically as the line of their evolution, we have yellow as the primæval colour, as seen in the first change from green in the sexual organs of the Coniferae, the prototypes of flowering plants. The next to come is red of some shade, then purple, and finally

pure blue. White may occur anywhere in the series, as being the loss of all colour.

Now, the theory runs that the coloration of flowers is due to the stimulus to their nourishing process, induced by the irritations set up by the insects when searching for honey. The fact that the colouring is uniform and regularly distributed in regular flowers, which can be visited from all points of the compass, but is specially localised in irregular ones, and as far as the guiding marks are concerned, exactly tallying with the positions of the visitors, we are led to see a direct cause and effect; but how the plant responds and distributes the colours is unknown, and is likely to remain so. There is, however, no harm in speculating, provided one does not accept gratuitous assumptions as necessarily true.

With regard to regular flowers, all we can say is, that when the ground is white, or some other colour than yellow, and the base alone of the corolla is yellow, such is a retention of the ancestral colour, as in the Water Crowfoot,

FIG. 24.—RHODODENDRON FLOWER, SHOWING "HONEY-GUIDES" IN THE SPOTS UPON UPPER PETAL.

and probably descended from some terrestrial yellow-flowered Buttercup. If the base colour be red or blue, as in the Forget-me-not, then this has been stimulated to pass further on in the series. If the central "eye" be of a darker and richer tint than that of the petals, then we should say that it had received an extra stimulation over and above that of the general ground colour of the flower itself.

With irregular flowers some have yellow guides on darker base-colours; such would be regarded as retentions of the ancestral yellow. Others, like Foxglove and Stachys, have lost the original yellow, leaving only white on which spots occur. It is more common for the streaks and spots to be of some deeper tint, as in Primula, Calceolaria, Tropæolum, &c. In Pansies, besides the special guides, all the petals have retained a yellow base, indicating the original colour, as seen in Viola hirta.

Mr. Hervey, in his *Observations on the Colours of Flowers*,* in describing honey-guides, remarked that he had never seen or heard of any explanation regarding their origin, and offered an original

elucidation of the subject (p. 57). In my work, *The Origin of Floral Structures* (1888), I stated:—"The prevalence of brighter colours in conspicuous flowers which are regularly visited by insects is due to the stimulating effects which they have produced, thereby causing more nutritive fluids to pour into the attractive organs. . . . The guides are always exactly where the irritation would be set up, and I take them to be one result of a more localised flow of nutriment to the position in question."†

Mr. Hervey takes the Nasturtium (*Tropæolum*) as his illustration, "of a yellow colour, with a longitudinal reddish-brown stripe on each of the upper petals. . . . This richness of colour is occasioned by the irritating influence of the bees in traversing the same route to and from the nectary, thus stimulating the flower to send more of its peculiar pigment to this point."‡

If the reader will compare the passages I have italicised, I think, so far, it will be seen that thus far that Mr. Hervey's "original elucidation" is really an unconscious cerebral result of absorption and appropriation. However, he writes me word that he regards "two factors as required to make those guides; one, the influence of the bees;" the other, "a general change of colour, except the position which becomes the guide, which I variously designate as vestiges and relics of the original colour."

He certainly did not obtain this idea from me; for as the reader will have seen, I take a precisely opposite view as to the basal coloration whenever it advances from yellow onwards. The general colour does sometimes revert, we all know, as e.g., where *Adonis autumnalis* loses its deep brilliant scarlet, and becomes the yellow variety "citrina;" but as a general rule, not only is the ground colour due to insect stimulation, but the guides to some additional influence. The lowering of the base-colour Mr. Hervey does not explain, "suffice it to say that the fading of a colour to a lighter tint is one of the most common occurrences in colour-change." But this will not account for it in flowers in full vigour long before they fade.

In *Tropæolum*, therefore, he regards the dark streaks as the original colour from which the yellow of the petals has faded. But *Tropæolum* as first introduced from Peru in 1686 was yellow-orange, and under cultivation and nourishment, which affects the coloration without the aid of insects, it has become golden-yellow or ruby-red, &c.

Mr. Hervey's interpretation of the change in the ground colour by a sort of degeneration (except when it reassumes yellow), is just the reverse of mine. As far as we know, *Tropæolum majus* never was dark red in the wild state, and the dark parts have been superadded according to my theory. Mr. Hervey thus considers a ground change as necessary in connection with insect agency. I see no necessity at all, and I repeat that I take guides to be additions to whatever the ground colour may be. *Papaver Rhæas* has generally no dark spots at the bases of the petals, but they are not at all uncommon in Malta, the colour of the petal being the same, or, if anything, a trifle darker (not lighter) than usual. *George Henslow*.

ORCHID NOTES AND GLEANINGS.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

THE following plants are figured in the January number:—1, *Cattleya Leopoldi* var. *purpurea*, Cogn.; 2, *C. Aclandii*, Ldl.; 3, *C. Atlanta splendens*, Hort.; 4, *C. Wendlandiana*, Hort.; 5, *C. Ella*, Hort.; 6, *C. Goossensiana*, Cogn.; 7, *Cypripedium A. de Lairese*, Hort.; 8, *C. Mahleræ* var. *Dr. Clinge Doorenbos*, Cogn.; 9, *Lisochilus Horsfallii*, Batem.; 10, *Oncidium Kramerianum*, Rehb. f.; 11, *O. reflexum*, Lodd.; 12, *Stanhopea Wardii*, Ldl.; 13, *Vanda Sanderiana*, Rehb. f.

* See *Gardeners' Chronicle*, December 30, 1899.

† *Op. cit.*, p. 178.

‡ *Op. cit.*, p. 58.

ONCIDIUM NUBIGENUM.

Under *Oncidium cucullatum* authorities have placed a very dissimilar set of plants, comprising *O. olivaceum*, *O. nubigenum*, and *O. Phalaenopsis*; and in defending *O. nubigenum* as a species, the late Prof. Reichenbach, in the *Gardeners' Chronicle*, 1867, p. 376, made the following interesting remarks: "When the lamented Dr. Lindley was a young lynx-eyed observer, he called this plant a good species. When he was older, and it had come into fashion to combine very heterogeneous types into 'one species' because 'there were too many species,' he believed it was his duty to cancel some of his own, and this *Oncidium* was degraded to the rank of a variety. Later he even named a variety *O. cucullatum nubigenum* for Mr. Linden. We believe this was a mistake, since the many flowers we have been favoured with by Mr. Linden, as well as Dr. Jameson's specimens, and a few sent by Messrs. Backhouse, never show any cucullate anther-bed, never have a produced nasiform keel on the lip, nor is there ever an isthmus to the lip. Messrs. Bateman and Linden are of our opinion as to the distinctness of the plant from *O. cucullatum*.

"It is a gay little plant, with spikes of flowers appearing as if they were diminutives of *Odontoglossum Phalaenopsis*."

An inflorescence of a very fine form of it is kindly sent by Frau Ida Brandt, Riesbach, Zurich (gr., Mr. Schlecht), and in it the entire absence of an isthmus to the lip, as indicated by the late Prof. Reichenbach, as well distinguishing it from others of its section is very evident.

In the colouring of the flowers the plants vary much, though through all run some similar features. The sepals and petals of the variety sent are creamy-white, densely freckled with pale rose colour. The broad labellum has a yellow callus, in front of which is a narrow band of purple, the blade of the lip being pale whitish-rose. Its affinity seems to be with *O. Phalaenopsis*, from which the characters specified by the late Professor Reichenbach clearly distinguishes it, and it has no relationship to the plant known in gardens as *O. olivaceum* and *O. cucullatum*. It is well illustrated as *Oncidium cucullatum* var. *nubigenum* in the *Botanical Magazine*, t. 5708, from a plant flowered by Wentworth Buller, Esq., and the habitat is given as the western side of the ridge of Asuay, Ecuador, altitude 11,000 feet. J. O'B.

SCOTLAND.

APPLES.

APPLES, like Pears, are this season of excellent quality; somewhat below the average in size, but so far have kept well. It is seldom indeed that the characteristic features of varieties have been so well developed, fruits so perfectly formed and finished, so highly coloured and so well flavoured. The supply of both dessert and culinary Apples required to meet current household demands has been drawn chiefly from a limited number of kinds, and those outside the number might just as well have been dispensed with, or their places filled with sorts that in all respects are always reliable.

Could we rely on certain varieties succeeding alike well on all soils it would greatly simplify practical pomology. But there is no garden-crop that exhibits a divergence in this respect so great as the Apple. It has been assumed that certain varieties succeed in given districts, which to some extent is true, but no one can depend on a variety which gives his neighbour satisfaction being equally satisfactory to himself. I have known gardens distant less than a mile from each other in which varieties showed the most perplexing differences both as regards health and cropping; strong loams suiting some kinds, and light soils others.

There is another point perhaps less regarded than it ought to be in estimating the value of varieties, which is, the relative size of fruit. There are not

a few sorts that crop heavily—sorts not infrequently of a local reputation, which produce fruits so small as to be not worth storing. I do not, of course, refer to trees which from overcropping are incapable of bringing fruit to its normal size, but to those crops which no amount of thinning will cause to swell beyond a small size. Want of quality is similarly not always taken account of: some cooking Apples, otherwise good, are insipid; others, again, are extremely acid, which is by no means a drawback with some palates. But these points cannot be overlooked if we wish to produce the maximum amount of good fruit from a given number of trees.

A generally prevalent feature in Apple selection that cannot be commended is the preponderance borne by early sorts over late ones. Commonly there is a superabundance of Apples early in the season, and a scarcity from January onwards. The reason for this is, no doubt, that free cropping early soft Apples are planted, and late ones neglected, when it ought to be just the other way. The production of late-keeping Apples is, moreover, affected injuriously in ways that do not so largely affect early kinds. One cause of shrinkage is the loss caused by high winds, more particularly in the case of the largest varieties. It is, no doubt, true, that fruits of Alfriston, and one or two other sorts, if not badly bruised, may be preserved till winter, but they cannot be depended on for a late supply. Trees of late varieties, again, cannot be cropped so heavily as early kinds without breaking down ultimately under the strain. A long and genial autumn works wonders in recuperating early sorts after the fruit has been gathered; but late varieties can be relieved in no other way than by cropping sufficiently lightly to permit the trees, while perfecting their crops, to provide fruit-buds at the same time for another season. In the same way with early varieties, crops may be secured from trees thickly branched, while with late kinds it is almost indispensable to dispose the branches so thinly as to make each one practically a separate cord; and there is also the fact never to be left out of consideration, that it is the late varieties that are most affected by unpropitious seasons. These are, I think, the chief reasons why the number of trees of late-keeping varieties should be always large, and proportionately greater than early sorts.

I have been examining the lists of Apples recorded in the report of the Apple Congress held fifteen years ago, and they are remarkable as still affording a safe guide to planters. From the first twenty of either dessert or culinary sorts, a fairly good selection may be made to meet all requirements, and in many cases the selection might be limited to the first twelve.

APPLES FOR DESSERT.

King of the Pippins then, as now, holds first place as the most generally useful dessert Apple [but not so choice as Cox's Orange Pippin. Ed.]. It is a variety that yields the best results on a warm light soil, and the finest fruits are produced on young shoots of a few years' growth, to secure a supply of which a regular system of growing-on, on young stems, to occupy the place of those that fail to bring forward fine fruits must be carried on. The fruit, as a further aid, must be severely thinned while yet small, and in October, when it begins to colour, the trees should be examined twice a week, and any that are ready gathered. The season during which the fruit is in its best condition extends from the end of November till the new year, after which time the flesh becomes mealy. Fruit beyond what is wanted for dessert is useful for cooking. Cox's Orange Pippin and Ribston Pippin produce the finest Apples when grown on a loamy soil. Both require to hang late when grown in bush form, and they are most useful when not eaten till after the new year. The last-named, like Blenheim Orange, is a first-rate culinary variety. Less valuable than these, and perhaps not very well known, but a very commendable sort nevertheless, is Duke of Devonshire,

the history of which is obscure. It is more generally cultivated in Scotland than it appears to be in England; the tree is dwarf and sturdy in growth, and the best fruit is produced on thinly-disposed spurs, the branches also being widely apart. Though a large crop of fruit is seldom, if ever, produced, it is at the same time necessary, in order to secure large and fine samples, to thin to a small crop; the fruit is ready to be gathered towards the end of October, and is in use during February. Sturmer Pippin is another certain cropper that requires severe thinning of the young fruits. The time to gather it is about the second week of November, and the fruit is used in spring; along with the following sort, it is one of the best Apples for Scotland.

Adam's Pearmain, which is not more remarkable for its other good qualities than for its fruitfulness, few Apples setting heavier crops with the same regularity. The tree is slender of growth, and the finest fruit is secured when the tree is permitted to grow with little pruning beyond the removal of worn-out branches, and those necessary to allow a free admission of light and air to the foliage. Through neglecting to thin, the fruit is usually small, and it generally hangs on the tree till the end of October. I know no more useful late varieties than these. Of the earlier kinds, Margaret, Mr. Gladstone, Irish Peach (best unpruned), and Worcester Pearmain, are in all respects reliable. James Greive, of the newer sorts, promises well.

APPLES FOR THE KITCHEN.

Culinary Apples, because of the large number of really first-rate sorts, are more difficult to select than dessert varieties. The earliest fit to cook is Early Julien, also known in Scotland as Tam Montgomery. Old trees bear more profusely than young ones, from which, however, the finest fruits are secured. While exceedingly acid during summer, if left long enough on the tree, the fruit becomes by September agreeable to the palate, and it possesses remarkably good-keeping qualities. Where, however, Keswick Codlin is well grown, the above variety is scarcely required, and this is of all early Apples the best suited to Scotland. The best fruit is invariably produced on young wood. Lord Suffield, since so many large soft-fleshed varieties have been planted, has largely decreased in favour. At the same time, taking into account its quality as the best of Apples when cooked, it is doubtful if it can be superseded. I find also that the similar constitutional defects are not absent from other kinds that have been cultivated a sufficiently long time to develop like traits. The tree should not be largely spur-pruned, but on the contrary a constant supply of young growths of a fruit-bearing age encouraged. An occasional application, say once in two years, of ferric sulphate ought also to be made, and its tendency to over-crop neutralised by thinning. From the Hawthordens, Stirling Castles, Ecklinville Seedlings, Queen's, Cellinis, and Warner's Kings, it depends on local circumstances which are the best. Personally, I prefer the last-named as at once the best in quality of fruit, and equally fruitful with any other sort of its season, which here extends to Christmas, after which the crispness of its flesh disappears. Tower of Glamis is a commendable late Codlin, but where Blenheim Orange succeeds there is no better sort available to bridge over the period between the soft Apples and the hard-fleshed late ones than is it. Bramley's Seedling during several years has proved a really reliable sort, not, however, superseding Dumelow's Seedling where the latter succeeds, which it does not do here, and a stock of Newton Wonder is being worked up in order to replace it should this variety prove satisfactory. Lane's Prince Albert suits us perfectly; and one of the best varieties that we have is Mère de Ménage. The tree always crops well, producing large fruits, remarkable for acidity. The best of all late Apples, taking into account size and good quality of fruit, evenness of crop, along with

keeping qualities of a high order, is Alfriston. The tree, though somewhat dwarf, grows to a fair size before it will crop heavily; it bears freely on spurs. Northern Greening is another late variety that always yields good returns; it is necessary to thin the fruit in a very free manner, and to thin spurs and buds in the same way annually. Another very late Apple which, by means of thinning, produces fruits considerably increased in size, is Dutch Mignonne. B.

CATTELEYA INTERMEDIA VAR. AQUINII.

THE accompanying illustration (fig. 25) represents a very remarkable Orchid, which was described by M. Barbosa Rodrigues, Director of the Botanic Garden at Rio de Janeiro, in 1893, as *Cattleya Aquinii* (*Journ. des Orch.*, iv., p. 144). The photograph, together with dried flowers and a coloured drawing, have been sent by Señor Graciano, A. de Azambuja, of Porto Alegre, S. Brazil, in the belief that it will "greatly interest many readers of the *Gardeners' Chronicle* as a notable case of

FIG. 25.—MONSTROUS FLOWER OF *CATTELEYA INTERMEDIA*, VAR. *AQUINII*.

fixed peloria. All specimens which exist of this *Cattleya* have been taken from the one and only plant which was discovered here (at Porto Alegre, in the province of Rio Grande do Sul), many years ago by a Portuguese gardener named Valladares. The flowers are identical from year to year. I believe that the *Cattleya* sent to the botanical garden at Rio by Señor F. de Aquino was taken from this parent plant." It has been figured by M. Rodrigues in *Plantas Cultivadas no Jardim Botânico do Rio de Janeiro*, p. 23, t. 4, fig. c. Although originally described as a distinct species, it has long been known as a peloriate state of *Cattleya intermedia*, in which the petals are lip-like in shape and colour (*Orch. Rev.*, i., p. 310; ii., p. 207). This peculiarity renders the variety very distinct, and the abnormal character cannot be considered a defect, as judged from the florist's standpoint, but rather as giving the flower an additional attractiveness. The character seems to be quite fixed, as in the case of *Uropedium*, and the double form of *Epidendrum vitellinum*. One other abnormal condition of this *Cattleya* is known, namely, *C. intermedia* var. *proliferans*, which was figured in these pages in 1887 (vol. ii., pp. 12, 13, fig. 3). An examination of one of the dried flowers mentioned

above shows the cause of the peculiarity, the column being abnormal. It is well known that the pair of teeth or wings seen on the column of so many *Ochids* are staminodial in their origin—occasionally they revert to their original character, coming as perfect anthers—and in this case they seem to have partly or wholly wandered from their usual position, and have become united with the petals, thus giving them their partially lip-like character. In fact, the side-lobes of the lip were long ago recognised by Robert Brown as staminodial in their origin, and, though this view has sometimes been questioned, there can be little doubt that it is the correct one, as Lindley and Darwin also held. That the petals are not transformed into perfect lips is what might have been expected, for each petal has only the addition of a single staminode. These abnormal flowers are often interesting for the light they throw on the structure of an *Orchid* flower, but the present one is also handsome, and we may hope to see it yet under cultivation in Europe. R. A. Rolfe.

THE ROSARY.

THE ROSE-HOUSE.

THE month of February brings plenty of work among the Roses, both indoors and outside, more especially the former. All Roses under glass, whether forced or merely housed in cold houses, are now active, and there should be no delay in getting the pruning finished. In houses having a temperature of 50° to 60°, flowers will soon be plentiful upon plants that have been moving steadily since the middle of the month of November. A slow start, and steady and gradually increasing temperature, are of very great importance in forcing Roses. It conforms more nearly with Nature, and we do well to take more note of this than is often done. To bring plants from a cold, and often freezing atmosphere, direct to a temperature of 55° or 65° only excites the sap already in branch and roots, and causes the premature growth of comparatively little value as compared to that which plants produce when gradually brought on. Roses immediately excited by heat are sure to receive more or less of a check at a very critical period, resulting in blind or flowerless growths. When Roses have made sturdy growths from 2 to 3 inches in length more heat may be applied, but our plants are never exposed to more than 70°, except for an hour or two upon a sunny day.

The Rose-house for early forcing should be a light one, and care taken to allow the foliage to become dry before nightfall. During the daytime, unless foggy, I believe in more moisture than the majority of growers give, especially if a little ammonia from liquid or other manures is present.

After several years' experience and from observations I have made in other gardens, I feel certain that a large number of failures with winter Roses is due to over ventilation. The least draught does harm to young growth, and the check given favours attack from mildew. The effects may not be observed at once, but the check has undoubtedly done harm.

Another frequent cause of disappointment comes from the use of too strong insecticides in destroying insects. It is more prudent to use them in mild form as soon as the insects are observed, than to let the latter increase and then to use insecticides in great strength. The insecticide known as XL All, if used at night, and the plants syringed in the morning with rain water at 75°, with 1 oz. of soft soap to the gallon dissolved in it, will kill those insects which may have been merely stupefied, and cleanse the foliage. I believe in fumigation when performed with care, for it reaches many insects which water applied with a syringe would not reach.

Whether the plants are in pots or borders, a light stirring of the surface is very beneficial to them. I have often been surprised to find moss

growing on the soil of pot-Roses. This stirring of the surface-soil and destruction of moss affords the gardener a better opportunity of ascertaining the needs of the soil in regard to moisture. Where many plants are grown, it is not always an easy matter to afford water to the whole of them correctly. Some may appear sufficiently moist, and be really dry in the centre; the soil of others may show slight signs of drought on the surface, but be moist enough lower in the pot.

Much has been written in these pages about the forcing of Roses, but not enough upon the importance of a proper selection of varieties. This is more especially the case when blooms are required in mid-winter. The following are all useful at that season, give a good selection of colours, the blooms open well, and the plants grow freely, and flower abundantly. Some are undoubtedly "thin," or few-petalled, and of comparatively little use during a hot season, but in the winter season they are very fine, and keep fresh for a long time, both on the plants and when cut. All of these mentioned have done well with me:—Beryl, Catherine Mermet, The Bride, Maman Cochet, General Jacqueminot, Gruss an Teplitz, François Dubriel, G. Nabonnand,

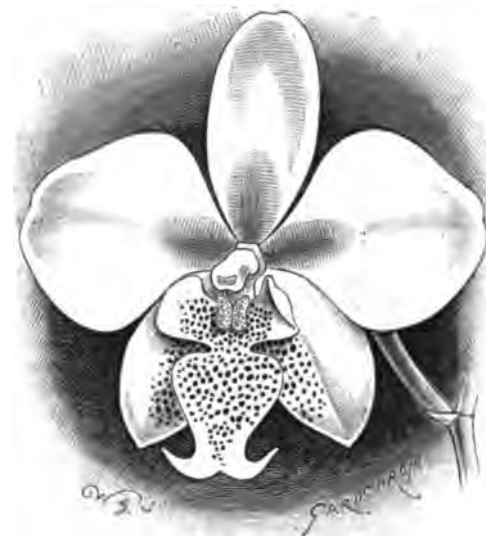

FIG. 26.—*PHALÆNOPSIS* × *SCHILLERIANO-STUARTIANA*.

Paul Nabonnand, Madame Faloot, Perle des Jardins, Niphetos, Sunrise, Kaiserin Augusta Victoria, Madame Badin, William Allen Richardson, Maréchal Niel, and Reine M. Henriette are eighteen that may be depended upon. A. Piper.

PHALÆNOPSIS × SCHILLERIANO-STUARTIANA.

Messrs. HUGH LOW & Co., of Bush Hill Park, Enfield, have constantly taken a leading part in the introduction and cultivation of species and varieties of *Phalænopsis*, and they have been very successful with them. For years the fine house full of *Phalænopsis* at the old establishment at Upper Clapton, was the admiration of the visitors to the nursery, especially in the flowering season. That same house, under the shadow of the offices, with other buildings in close proximity, and with the further disadvantages of London fogs, went far to prove that to those who understood their management, *Phalænopsis* were not the difficult plants to cultivate that many gardeners supposed. It is much to his credit that Mr. J. Anson, who has the management of Messrs. Low's Orchids, was always able to keep the collection in superb condition, though towards the latter part of the time at the old nurseries they gave him rather more trouble than

formerly. *Phalenopsidea* often resent a change, and the removal to their present quarters at Bush Hill Park might have produced bad results, though the contrary has been the case, for the plants thrive as well there as at the old nurseries.

The importations of Messrs. Hugh Low & Co. have produced some of the best of the species now favourites in gardens, such as *P. Aphrodite gloriosa*, *P. Stuartiana*, and a very fine type of *P. Schilleriana*, which produced the pure white variety *Vestalis*; some very beautiful *P. × leucorrhoda*, the result of natural cross-fertilisation between *P. Schilleriana*, *P. Aphrodite*, and other rare and beautiful varieties. *Phalenopsis × Schilleriana-Stuartiana* (fig. 26, p. 83), which was shown by Messrs. Hugh Low & Co. at the meeting of the Orchid Committee of the Royal Horticultural Society on January 23 last, and which was awarded a First-class Certificate, is one of the best hybrid *Phalenopsis*, its well-rounded flowers, which are white, with the inner portions of the segments delicately flushed with pale rose-pink, being very attractive. The form of the lip seems to be intermediate between the parents, the yellow callus dotted with dark red recalls *P. Stuartiana*, which species is also indicated in the lower sepal. The foliage is dark green, with the broad silver bands of *P. Schilleriana*.

For a considerable time past the large *Phalenopsis*-house at Messrs. Hugh Low & Co's., Bush Hill Park, has been a fine sight, with its numerous flower-spikes of the various species of *Moth Orchids*. At present also there is a fine show, consisting principally of *P. Schilleriana*, *P. Stuartiana*, and *P. Aphrodite*, and with them some good varieties of *P. × leucorrhoda*, including *P. × Casta*, and *P. × Cynthia*. Also in bloom are a very richly-coloured *P. × intermedia Brymeriana*, *P. denticulata*, and *P. amabilis*.

THE BULB GARDEN.

NOTES ON BULBOUS PLANTS.

Hymenocallis Hornemani.—This magnificent-flowering bulbous plant has just passed out of flower at this place (Isleworth). It produces strap-shaped leaves, 2 to 3 feet long; a scape 2 feet high, bearing an umbel of sixteen pure white flowers, each from 14 to 15 inches in length, and consisting of an erect tube 9 inches in length, and six linear, involute, twisted and drooping segments, which measure 6 inches in length. The staminal cup is wide and funnel-shaped, 1 inch in length, and surmounted by long, spreading stamens, which give a peculiar grace to the flower. The umbel has a refined appearance. The plant requires the temperature of an intermediate-house, and to be grown in a compost consisting of a loose and durable character. It must have plenty of water when in full growth, the amount being reduced when the plant is resting in accordance with the amount of leafage it carries. There are at least twenty species of *Hymenocallis*, all of which are worthy of being included in any collection of flowering-plants; *H. Hornemani* is one of the best of them. It is a native of Mexico.

Crinum erubescens var. *minus*.—This is a graceful species, producing a dozen leaves 3 feet in length, 4 inches in width; a purplish peduncle 2 feet high, bearing an umbel of six large white flowers. Each flower consists of a tube 6 inches in length, and a spreading perianth-limb, the segments of which measure 6 inches in length, half inch in width. The prominent filaments and style are tinted with purple, affording a good contrast with the white flowers. The plant is sub-aquatic, and should be cultivated in shallow pans, filled with water during the summer. It is a native of Jamaica, where it is found growing on the borders of marshes and lagoons about Palmetto Point on the N.E. coast. It is identical with *C. Roosenianum*, O'Brien, under which name the plant is best known in gardens. One of the chief objections to *Crinum* is, I gather, their colossal size. This may hold good of such plants as *Crinum Moorei*,

amabile, *asiaticum*, and the like; but by far the greater number of them are readily accommodated in an ordinary brick-pit, and are well worthy of the attention of the gardener. There is also considerable scope for the hybridist in the genus; and hybrids have proved valuable additions to our garden flora.

Lycoris squamigera and others.—*Lycoris squamigera* has again flowered remarkably well. The flowers much resemble those of *Amaryllis Belladonna*; but are lilac-rose in colour, and produced earlier in the season. It is a fine plant for growing at the base of a south wall, or on a very warm border. *L. sanguinea* has broken a flowerless record, extending over several years, by flowering this season. The colour of the flowers, as the name implies, is blood-red, or rather paler; the flowers measure 1½ inch in length, are trumpet-shaped, and appear in fives on a scape about 1 foot long. This species has produced seeds. As I believe these have not been described, I give a short description. They are perfectly round, measure three-eighths of an inch in diameter, and are exactly similar to those of *Amaryllis Belladonna*. Three seeds were found in each seed-vessel. *Lycoris aurea* and *L. radiata* are both very disappointing garden plants; they grow freely, but never flower. This is the more to be regretted, as *L. aurea* is a pretty plant for the greenhouse, the flower of which may be roughly described as being like those of a yellow *L. squamigera*. *Geo. B. Mallett, Isleworth.*

ALPINE GARDEN.

HARDY CYCLAMENS.

Cyclamen libanoticum.—This is a new species, and as its name implies, it is a native of Palestine, and was distributed as a new plant last year. Forming an opinion on the character of the plant in the nursery here, it is one of the finest of the family with which I am acquainted. It is quite hardy in this country, grows vigorously, flowering profusely during the months of January and February. The blossoms are about an inch in width, borne on stems about 6 inches in length, and possess a powerful and delicious perfume. In colour they are white, shading to deep pink, with a dark crimson spot at the base. Its leaves are developed before its flowers, and in shape they are orbicular, distinctly marked with a white zone; and in texture very firm. The corms are very large, and of irregular shape. It does not appear to be particular as to soil, but we prefer to use one that is light and rich, with leaf-mould added. A half-shady position is best for this species, although some of the plants are succeeding in full sunshine. [Some flowers and leaves sent with these notes, bore out our correspondent's statement. Ed.]

Cyclamen repandum.—This is a neat gem, and although reputed to be somewhat tender in places, this is not the general experience of cultivators. Its flowers are produced from March to April in abundance, and in colour they range from rosy-red to crimson, with a bright purple-coloured basal spot; they measure three-quarters of an inch in length. The leaves appear together with the flowers, and have a white zone on the upper surface, and the underside is tinged with deep purple. Its synonyms are *C. balearicum* and *C. ficarifolium*. A pure white form of this species is in cultivation, although very rare. *E. S., Woking.*

(To be continued.)

RAISING ALPINE PLANTS FROM SEED.

The "acclimatisation" of plants from high elevations has often been discussed in the columns of the *Gardeners' Chronicle*. While some growers prefer to work with transplanted specimens, others prefer to grow their plants from seed, as this plan is likely to yield better results. But there are, of course, certain plants that cannot be raised

from seed, and which, after germination, do not develop in the *Jardin Alpin d'Acclimatation* at Geneva.

In most instances the plan pursued is successful, as it is an imitation of the natural system of germination. Results may be long in coming, especially with species of slow growth, such as *Ericaceae*, *Empetrums*, and *Pyrolas*; but in most cases the work is easy, and possible to everyone, enabling them to obtain vigorous plants at the end of two or three years. As proof of this, I need only cite the fact that in this acclimatisation garden, nearly 4000 species of plants from the different mountains of the world are raised for sale, but only about a hundredth part are imported, the majority being raised from seed.

To ensure success, the following conditions should be observed: prepare a light sandy soil, just sufficiently nourishing to contain the necessary amount of food for the young plants. We use a mixture of one-third peat, one-third loam, and one-third of granitic or of calcareous sand, according to the requirements of the species. The most favourable seasons for the seed-sowing are late autumn, that is to say, the end of November or the beginning of December, or the spring.

The seeds are sown in pans, trays, or pots, with abundant drainage. Spring sowing is to be preferred in localities where snow is deficient. Care should be taken to cover the seed lightly, not to force it into the ground. The pots or pans should be kept in a cool, dry, and clean frame. If snow should fall, the seedling should be allowed to be buried under a thick layer of it. The snow may even be heaped up over the surface of the pots, and then be watered early on cold nights that it may become frozen over.

The influence of the snow upon the seedlings is considerable, as we have proved in our garden. Seeds of *Gentians* and *Primulas* were started at the same time and under identical conditions; except that while one series was left beneath the snow, the other plants were uncovered by it, and the former set all germinated at one time, and under the same conditions—the remainder which had been uncovered, came up irregularly and much later.

In districts where snow is deficient it is best not to sow seeds until March, and to let the rains fall upon it as much as possible. If the pots are well-drained this has no ill-effects.

If seed is sown later, or in a southerly and dry district, some sifted sphagnum should be added to the soil to give it a spongy and porous consistency, and a uniform degree of moisture. The moss takes the part played under natural conditions by the rocks: it absorbs the damp, then restores it little by little to the soil. From a hygrometric point of view, it is a regulating power.

The species first to germinate are those belonging to the *Cistus* family (*Helianthemum* and *Cistus*), *Crucifers* (*Draba*, *Erysimum*, *Arabis*, *Aethionema*, *Alyssum*, &c.); and Leguminous plants (*Oxytropis*, *Phaca*, *Astragalus*, *Cytisus*, *Anthyllis*, &c.). Then come Composites (*Edelweiss*, *Aster*, *Eriogonon*, *Hieracium*, &c.); Umbellifers (*Eringium*, *Meum*, *Astrantia*, &c.); *Crassulas* (*Sedums* and *Sempervivums*); *Saxifrages*, *Campanulas*, *Potentillas*, *Violets*, and so on. The species slowest to germinate are *Gentians* (especially if the seed is not very fresh), *Primulas* (*Primula*, *Androsace*), certain *Ranunculaceae* plants (*Pæonies*, *Ranunculus*, and *Aconites*); and *Fraxinellas*, which are sometimes two years before they come up, certain genera of *Berberis*, such as *Leontice* and *Jeffersonia*, certain *Lilies*, *Colchicum*, and *Iris*, *Corydalis*, and so on. Too often a seed is considered lost if it do not germinate after a few months, but it should never be thrown away until a year at least after sowing; or until two years after if it be one of the genera and species enumerated in the last list.

Germination is, after all, capricious. While *Anemone alpina* and *A. sulphurea* at the end of twelve or twenty days after the sowing of fresh seed

will come up, the seed will be several months or even a year before germination, if sown four or five months after it was gathered. These remarks apply also to Gentians and Primulas.

When the seed has germinated and the young plants are of a fair size, they are pricked out into rows or quincunx. Once able to endure complete isolation, the seedlings are set singly in small pans, from which they can be moved to the open ground or rookery, or be planted in larger and ornamental pots.

I have another hint to give intending and inexperienced seed-sowers. When the seeds are very fine, as are those of Saxifragas, Sedums, and Sem-pervivums, for instance, they should not be covered with earth, but with a thin layer of sand to pre-

all the flowers possessed narrow florets in much greater numbers than was the case in 1898, some having as many as fifty. It seems probable that before long Dahlia flowers will be produced with broad lower florets, and centres filled in with narrow thread-like ones, resembling in this respect the Anemone-flowered Chrysanthemums (see fig. 27). *W. E. Endicott, Canton, Mass., U.S.A., Jan. 18, 1900.*

VARIATIONS PRODUCED BY GRAFTING, AND THEIR INHERITANCE.

(Continued from p. 86.)

NUTRITION.—Some sixty or seventy pages are devoted to theorising with regard to nutrition. The ideal behaviour of plants under imaginary and

which is kept in a house while the roots are outside. In a similar way in experiments the stock was kept in one temperature and the scion in another, so that the precocious plant was retarded, and the more slowly-growing one advanced.

Double grafting, as it might be expected, must double many of the disadvantages of the simple process, but an explanation of cases where the former operation is of importance is given: Plant A will not succeed on plant C owing to something objectionable to the stock in the elaborated sap of the scion. By the use of an intermediary, B, which is not affected, the difficulty is got over.

An interesting criticism of the expression that the French Vine when grafted upon the American "resists" the attacks of the Phylloxera, must not be passed over. It appears that such grafting is only successful in the presence of the pest. The insects remove a portion of the sap, which the more vigorous roots of the American stock can take up; if no parasites were present, there would be too large a supply for the needs of the French scion, which would suffer in consequence. Such bad results could, however, be overcome by allowing the shoots to grow from the stock, thus giving rise to a mixed graft.

A point not previously touched upon is the variation which may occur upon grafting, in the plants' power of resistance to cold. The more water present in the tissues, or, speaking practically, the less the branches are ripened, the greater the risk of damage by frost, and, in consequence, a stock which floods a scion with water is likely to cause its death in winter time should be avoided.

M. Daniel applies his theory to the culture of Apples. For the grower in a large way he advocates the use of trees on their own roots. These live and bear nearly five times as long as grafted ones. The gain in time of fruiting, he has already shown, is made up for by loss in the total amount of fruit produced, and there is the money to be reckoned which is spent on manure, labour, and the cost of replacing trees. As a rule, in the west, where trees are planted to the utmost extent that space will allow, the soil becomes exhausted in every way, and there is no room left for a plantation to be made which will come on and replace the older one. The fruit farms become great orchards of grafted trees, exposed to every malady that follows grafting, especially of a defective nature, and doomed to rapid decay. Under these circumstances, how can one replace the trees when the soil is exhausted as well?

The practice should be to plant moderately, leaving a sufficient space between the trees, and preferably using trees on their own roots, only grafting such examples that produce inferior fruit. To the grower in a small way, who only thinks of quality, and uses or abuses grafting to get the best fruit as quickly as possible, this does not apply in the same degree, seeing that he can easily change his plants and his soil.

Double-grafting is strongly objected to, and it should, the author considers, be banished from the cultivation of the Apple. The process may double the profits of the nurseryman, as the trees quickly become marketable; and as a result of double-grafting they last for a much shorter time, and have consequently to be sooner replaced. The fruit-farmer's interests are the direct opposite of this last consideration, and he must use trees on their own stocks, or simply grafted. This is the only answer that M. Daniel can give to the question raised by the French Pomological Society in October, 1898, at the Congress of Mans.

GRAFT HYBRIDISATION.

In the following chapter, variations caused by the mutual action of scion and stock are considered. In certain grafts of *Alliaria officinalis* on the green Cabbage, the characteristic odour of the former plant is sensibly modified, and can only be recognised after the leaves have been rubbed for some time, and the stock partakes of it somewhat. When the Cabbage is put on to the Turnip, the

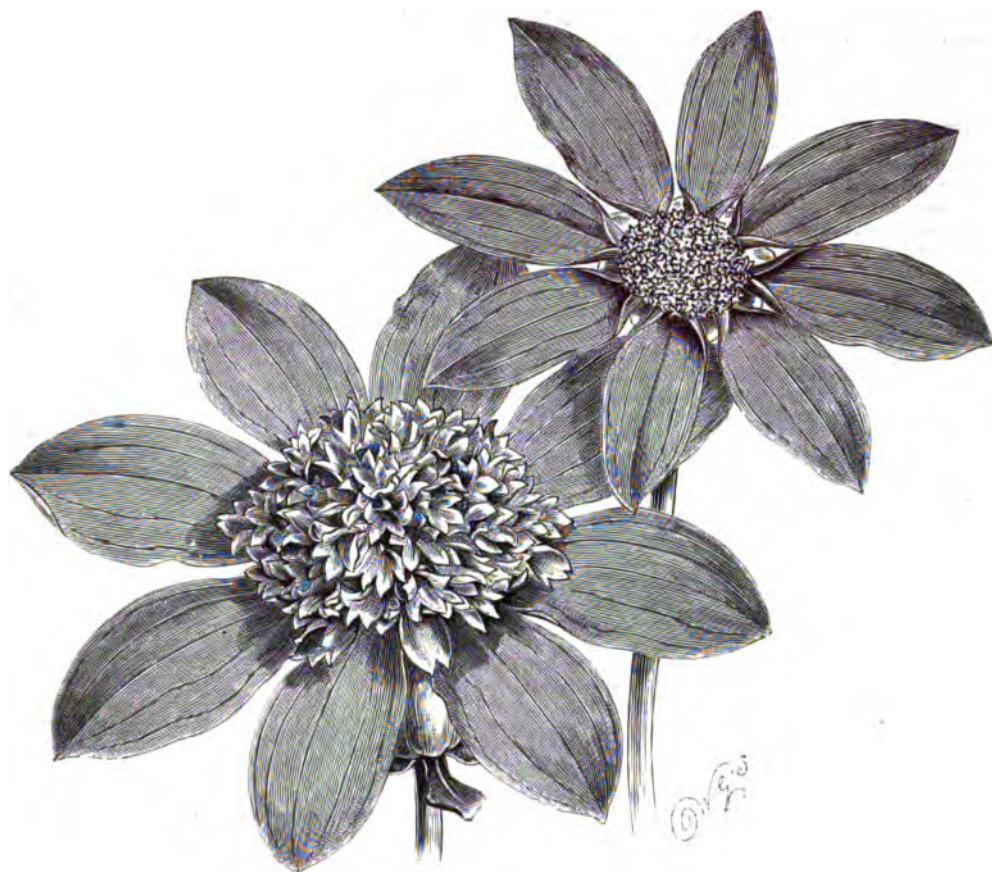

FIG. 27.—DAHLIA EXCELSA, SHOWING A CONDITION IN SOME RESPECTS RESEMBLING THAT DESCRIBED BY A CORRESPONDENT ON THIS PAGE.

vent them from being washed away when watered. It is even preferable to moisten them from below, letting the soil absorb the water. *H. Correvon, Geneva.*

FOREIGN CORRESPONDENCE.

THE BEGINNING OF A NEW RACE OF DAHLIAS.

At the present time, when the Dahlia is fast regaining popularity, it may be of interest to record what to me seems to be the beginning of a new race of this flower. In 1898 I found among my seedlings a plant some of whose flowers (single) had a long narrow floret lying on each of the usual broad ones, and never having observed anything of the kind before, I saved the plant as well as a few seeds, and planted the tuber and sowed the seeds last year. The latter failed to germinate, but the tuber sent up several fine strong growths, and

perfect conditions is dwelt upon, and what happens in actual cases the more easily worked out. It is stated as a principle that a wild plant in a given position never attains to its maximum size, because it never meets with those perfect conditions in its surroundings which alone would allow it to bring out its full capacity of absorption and assimilation. This explains why, when man takes to altering the circumstances of growth, as in cultivation, a whole plant, or even a part of a plant, may reach a larger size.

Most principles of this kind, says M. Daniel, are now-a-days familiar enough to the physiologist, but not to practical men; and he does not think that they have been applied in any previous case to the phenomena of grafting. We cannot, however, follow M. Daniel through all his theoretical arguments, and must content ourselves with mentioning a few points that crop up incidentally. One method alluded to by means of which success in grafting was secured, is taken from the ordinary culture in this country of Vines, the foliage of

latter becomes sweeter than usual, and loses its characteristic flavour. A Haricot-Bean, cultivated for its seeds, and the pods of which are disagreeable to the taste, grown on the roots of a variety, the fruits of which are eaten, produced some like these in taste, but of normal shape. These examples of chemical changes serve to prove, in M. Daniel's opinion, that the product of graft-hybrids is possible. The term, he says, is not very exact, but serves very well to show the origin of such plants.

Increased powers of resistance to cold, and to the attacks of parasites, is also claimed as being due to transmission of qualities from stock to scion.

Changes in the habit of growth next command attention. Among conical-headed Cabbages that had for stocks a variety that rejoiced in a round heart, were individuals that took this form and several intermediate shapes. *Helianthus laetifolius*, with a rhizome carrying a small, terminal bud at some 15 inches from the aerial stem, was grafted upon *H. tuberosus*, where the tubers normally remain close to the base of the stem. Though retaining their size, these bodies were produced at the ends of stalks some 10 inches in length. Somewhat the same result was obtained when an annual species of Sunflower was put on to the same stock.

Experiments on Potatoes led to the conclusion that the grafting of two adult tubers is an impossibility, and that Trail's work cited by Darwin, had been incorrectly described. Plenty of grafts were made with young shoots, but the change in the colour of the flesh when one with white tubers was provided with roots that should have produced blue ones, was not necessarily a result of the process. White and streaked tubers occurred though in smaller numbers among the control plants. M. Daniel is going to reverse the experiment to obtain more definite evidence.

When the woody *Helianthus laetifolius* was induced to unite with the Sunflower, the resulting plants with the latter as stock were flourishing after the control Sunflowers were dead. The stock had become very much more woody than usual, had lost its hairs and developed lenticels, so as to very much resemble the scion; this likeness was emphasised by a microscopical examination of the tissues.

Among trees, Mr. Daniel describes and gives photographs of the extraordinary branches sent out below the graft by the White-Thorn stock of a Medlar-tree at Bronvaux, near Metz. Some of these are furnished with thorns, their flowers are not solitary, but produce Medlars. There may even be on the shoots leaves of a character intermediate between the Medlar and White-thorn, while one starts with the typical foliage of the latter tree. This case is put down as a good instance of graft hybridisation, and M. Simon's opinion that the well-known *Cytisus Adami* is undoubtedly another example is given, and entirely endorsed by M. Daniel.

Perhaps the best results of this kind of hybridisation obtained during the experiments are met with in fruits. Striking figures of three forms from a single scion are given in the paper. These are from a shoot of the Egg-plant with long, violet fruits, grafted on a large, flat-fruited, red Tomato. One is the typical pyriform fruit to be expected; the second is egg-shaped, and small, such as would be produced by the white variety; and the third very much resembles the lobed and flattened fruit that would have been produced by the Tomato stock. Mention must also be made of the spines that appeared on the calyx of an Egg-plant normally without them, when grafted on a variety which possessed such structures.

With somewhat forcible arguments, the theory that graft hybrids are obscure hybrids of the sexual kind is dismissed. Solanaceous plants, for instance, have not been known to produce hybrids, and even if they did, the experiments show that grafting must favour sexual hybridisation; also a case is quoted from Darwin in which a Passion-flower on its own roots was not self fertile, but

became so when grafted on another species. Herbaceous plants are more plastic than woody ones, and show more instances of graft hybrids when studied; but it is pointed out that these would no doubt furnish more evidence of their occurrence if the stocks were not trimmed carefully so as to leave no shoots in practice.

(To be continued.)

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Imported Cattleyas that are received early in the year need not be placed in a darkened position, as would be necessary later in the season, to protect them from strong light. Nor should they be scrubbed severely, but merely washed in moderately warm water to free them from dirt and insects. *C. Trianei*, *C. Moensis*, *C. Mendeli*, the typical *C. labiata*, and *C. Warneri* are usually put into pots or pans, and placed upon the stages, but if the stages are some distance from the roof-glass, the two last-named will thrive better in pans suspended from the roof. Where only a small number of newly imported *Cattleyas* have to be dealt with, the best method is that of fixing them in the receptacles chosen for them with crooks only, and using no surface material until roots have appeared. Every means the plants possess that can be used to fix them should be utilised, but if these are not sufficient, stakes will be necessary, as it is essential that the plants shall not be liable to be swayed about when making new roots. It being a most difficult operation to thrust stakes into a pot almost filled with crooks, the stakes should be fixed in before many crooks have been put in, or the plant placed in position, and as the lower crooks are large and need to be placed perpendicularly, the work will not be troublesome. Next introduce the plant, and tie with thin tar-twine a few of the old pseudo-bulbs to the stakes, taking care to so place the growing point of the rhizome that it will have room to extend for two or more seasons. Then fill in almost to the rim with smaller pieces of crock. Place the plants all together in the *Cattleya*-house, and, with the exception of damping the material on the stage, afford them no water, nor otherwise excite them for some time. When the season has advanced a little, spray the pots and crooks slightly on bright mornings, and this will induce gradual activity. When roots have appeared, remove some of the superfluous crooks, and fill the spaces thus made with good fibrous peat and living sphagnum-moss, in the proportion of two of the first to one of the latter. In no instance should the rhizome be covered, though the material should be packed well up to it at every point where roots are likely to appear. When a piece becomes divided during its preparation for potting, and a specimen is desired, so dispose the pieces that the growing points have a direction inwards; the rhizomes will thus have farther to travel before reaching the edge of the receptacle, and in growing form a homogeneous mass. A rather limited supply of water should be carefully applied when the final operation of potting has been done, and until root-action has become general.

Miltonia Oloveni is now thrusting out new roots from the base of the youngest pseudo-bulbs, and may be given any attention the plants require in the way of potting. Use pots for this species, and thoroughly well drain them with rather small crocks. The rooting medium should consist principally of good lumpy peat, introducing a little sphagnum-moss here and there on the surface. The temperature of a warm intermediate-house is best for this plant, and excepting during the most active period of growth, the water-supply should be limited, as in the case of other *Miltonias*.

Oncidium phymatocylum.—Though producing large bulbs and leathery leaves, this species does not require a large amount of rooting medium. New roots are now pushing, and repotting may be done where necessary. Planted in well-drained pots or pans, and afforded a moderate amount of peat and sphagnum-moss, it should be placed in a *Cattleya* or warm intermediate-house, and water applied sparingly until growth has partially developed; frequently from that time until growth is com-

pleted, and only occasionally afterwards. *O. divaricatum* is a good companion to the above when in bloom. It should be cultivated in shallow pans, and suspended in the warm-house. In other respects its treatment should be that described above.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ilchester, Abbotsbury Castle, Dorset.

Clematis, *Planting and Pruning*.—No flowering climber or trailer surpasses the *Clematis* for covering and decorating walls, fences, trellises, old tree stumps, and rockwork, or for forming festoons and beds on the turf. Where varieties of *C. Jackmanni* and *C. viticella* are used, support is afforded against the wind if a few plants of the common Honeysuckle are mixed therewith. The *Clematis* on rockeries may be fixed securely by placing pieces of porous rock upon the branches heavy enough to prevent the wind dislodging them, or from tilting, which would be injurious as bruising the stems. When employed as plants for filling beds in the flower-garden, Bamboo-canes or Hazel-rods form a good network, over which the plants may be trained. Canes, &c., should be bent over and fixed firmly in the ground, so as to form a convex surface.

Pruning.—Established plants of the above sections of *Clematis* may now be pruned. First thin out all the weakly stems, and cut back the more vigorous shoots if the space or wall needs more shoots to cover it. *Clematis patens* and the large-flowering *C. lanuginosa* varieties are the best suited for covering tree-stumps and high trellises. When growing vigorously, much nutriment is required, and one way of affording it is by mulchings of rotten farmyard or stable-manure, applied after all of the superfluous growth is removed. The *Clematis* delights in a deep, rich, porous soil, and weak liquid-manure applied when the plants are growing, or the aforesaid mulchings of manure. Slugs play havoc, especially at this period, when the growths at the base of the plants show; but if a ring of fresh unslaked lime, or wood-ashes, be placed about them as they appear, it is a good deterrent. Cotton-wool is also a good safeguard, but it is at times stolen by mice and birds for nest-making. In planting, well prepare the beds, and choose strong, well-rooted plants which have been growing in pots, placing them 3 feet apart. Beds of *C. Jackmani* var. *superba*, alone (or mixed with its white variety) make very effective beds. Newly-made beds may be planted with *Gladiolus*, so as to add brilliancy to the effect.

General Remarks.—Arrears of digging should now be brought up; bulbous plants will now be on the move, and root disturbance should be avoided. In digging flower-beds the soil should be made neat and level, but of not too fine a tilth. Avoid digging in the snow, or getting on the ground when it is wet.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Melons.—The earliest seedlings that have been kept in a steady bottom heat with their heads near to the glass are now fit to be planted out in the bed. A hot-bed 3 feet deep of well mixed horse-dung and leaves is necessary at this season, in addition to any permanent means of obtaining bottom heat already in the house, as the atmospheric conditions induced by the hot-bed are favourable to the growth of the young plants. This bed should be made solid, and brought up to within 2 feet of the glass. Over this bed place sods with the grassy side downwards, and on these sods, at distances of about 16 inches, make slight mounds of well-decayed, light fibrous loam and bone-meal, just sufficient for the plants until they have started into growth. Tie each plant to a stake to hold it in position, and afford sufficient water at a temperature of 80° to settle the soil around the roots. Maintain a steady bottom heat of 80° to 85°, and a top heat of 70° to 75° by night, and 5° higher during the day. Afford the plants a slight shade for a few days after planting should the weather prove bright, and during frosty nights a mat thrown over the glass will tend to keep the house free from drip, and keep a more equable state of moisture. Sow seeds for succession-plants at intervals of two or three weeks.

Figs.—The earliest trees are in active growth, and the fruits are well advanced. Disbudding, stopping, and training, will now require daily attention. Do not retain more growths than can be fully exposed to sun and light, and train them into position at an early stage. Stopping should be done a little at a time, and according to the strength and growth of the shoot, and the backward or forward condition of the fruit in comparison with the growth. By too early stopping, the second crop of fruits may be brought too forward, and thus hinder the final swelling of the first crop. As a rule, strong shoots may be stopped at the eighth leaf, medium shoots at the fifth or sixth leaf, and weak ones left untouched. These latter will then have a long season for ripening, and will form the most fruitful wood next year. A steady bottom heat must be maintained under the pot-trees. If a good stock of young trees was propagated last year, a portion of them may now be subjected to warmth, to be grown on into half specimens for forcing another season. By starting them early, the plants will mature early in the autumn, and be in good condition for forcing next season if required. A few of these young plants may be grown in boxes, and trained in fan-shape. They will be found very useful for placing against any vacant ends of houses or front lights, and will bear an abundance of fruit. In planting them in boxes, place the plants at the edge, not in the centre of the box. This will bring the plant into its right position for training to back walls, wires, or other supports.

Cucumbers.—After a few weeks, the winter-fruited plants will not be worth retaining, and where provision has been made for a successional crop, the young plants will now be fit for planting. A steady bottom-heat of 75° to 80°, and a top-heat of 70° to 75° by night, and 80° by day, is essential. To attain these conditions at this season, a good bed of fermenting material will be required, and this should be well sweetened by turning and exposure, before being brought into the house. Build up the bed as near to the glass as convenient, so that the young plants will be near to the light. A layer 6 inches thick of light fibrous loam and leaf-mould will be a suitable compost in which to plant them. This depth will allow for surface-dressings later, when the plants commence fruiting. Encourage free growth by affording abundant atmospheric moisture, and husband the sun-heat by closing the house early after mid-day. The main stem will need to be stopped at 2 feet, and the side growths should be trained horizontally to fill up the base of the trellis.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Lettuce.—Cabbage varieties, such as Hardy Green Hammersmith, Schofield's, and Stanstead Park, that have been wintered in cold frames, may be encouraged to make growth. Afford them rather less air, and lightly break the surface of the soil with a fork between each plant. A moderate amount of water should be afforded if the soil is dry, and in a few days afterwards a sprinkling of soot over the soil to protect them from the slugs. Cos varieties, such as Bath Cos, and Hicks' Hardy White, should not be excited at present, and air may be freely admitted during the next few weeks. To supply early Lettuces in the open, such Cabbage varieties as Golden Queen, All-the-Year-Round, and Perfect Gem, are most useful, and seed may now be sown rather thickly in ordinary soil, and placed near to the glass in a warm structure. As the seedlings become larger, thinning out will be necessary, and this should be done carefully by means of a pointed stick. The little plants thus removed may be placed between rows of Potatoes in forcing-pits, and they will there produce tender leaves. Those plants left in boxes should be allowed to grow slowly, and when ready, may be gradually hardened off. Such plants will be found to heart more quickly after planting, than if transplanted twice.

Mint and Tarragon.—Continue to lift roots and place them in boxes or pots in gentle heat, and if handlights be placed over the permanent beds, growth will be accelerated there also.

Potatoes.—If the required number of sets were placed in trays as advised, sprouting will have begun, and they may be planted in 10-inch pots. The right manner of proceeding is to put a few large crocks at the bottom of each pot, then some rough loam over these; and fill to within 4 inches of

the top with equal parts of loam and leaf-mould, well mixed together. Two sets of even growth should be put into each pot, pressed firmly into the soil, and covered with soil. Place the pots in a light structure, so that growth may be sturdy; keep the temperature at 55°, and as soon as the haulm has grown above the pots, afford a top-dressing of the same kind of soil as the potting soil. Afford no water till the roots have filled the pots, and the young tubers formed, then apply enough to avert flagging. If a continuous supply of early Potatoes be required, the Potatoes may be grown in frames or pits heated with tree-leaves two-thirds, and stable-litter one-third. When the rank heat is dissipated, place a layer of soil, 12 to 15 inches thick, over the bed, and make moderately firm. In a few days, when the top-heat has fallen below 65°, plant the sets 1 foot apart in the row, and 18 inches from row to row. In cold weather the pits and frames should be covered with mats and litter, and it may be necessary in the case of frames to apply dung-linings, in order to keep up the heat, which ought not to fall below 60°. In the early stages a good deal of care is necessary in affording air. In fine weather the foliage may be syringed lightly.

Shallots.—These little bulbs are in constant demand in the kitchen, and in order to have them of good size, they should be planted early in the present month. Soil that has been deeply dug and is free from fresh manure is suitable for them, as aids to growth can be afforded later on. It is advisable before raking the ground to apply a sprinkling of fresh soot. When the ground is made even and firm, the "cloves" may be pressed into shallow drills at about 9 inches apart, leaving a distance of 15 inches between each row or drill, and merely covering them with soil. The ordinary variety is of middle-size, and of delicate flavour; and Carter's Mammoth Exhibition Shallot is larger, and suitable for exhibition. Shallots may be raised from seed, but they are not generally so satisfactory as those raised from bulbs. It is advisable to purchase some fresh bulbs at intervals of three or four years, as the Shallot is apt to deteriorate unless afforded a change of soil.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Red and White Currants.—Full-grown bushes will need to have all spray on the branches shortened back to three buds, and leading shoots should be tipped or cut back according to circumstances. When thinning branches from over-crowded bushes, remove the oldest and most awkwardly-placed ones, and to such a degree that in future the bushes will be freely open. Leave a few young shoots in old bushes to replace any that show signs of exhaustion, and "spud" out suckers from the base of all bushes. The aim in regard to young bushes should be to obtain a medium number of main branches well furnished with spurs. In determining which branches to retain, choose those that have a tendency to grow upwards, that the fruit will not be liable to be splashed in wet weather. Cut back rather severely one-year-planted trees. Cordons on walls, fences, or trellises, should have all side shoots spurred in, but merely top the leaders of trees which have still room for extension. The cordon is a capital method of growing these Currants, with the exception of the variety Cherry Red, and they may be thus grown on a northern aspect. Young trees having only one or two shoots are best to plant for this purpose.

Black Currants require to be thinned instead of spurred. Encourage the bushes to make plenty of vigorous shoots, and this can only be done by removing some of the old-bearing wood each year, and by feeding the plants well at the roots. The practice of cutting every other bush back severely each year has much to recommend it, but cannot always be adopted in these days. If the pruning of the bushes has been neglected, cut out as much of the oldest wood as can be spared. A good dressing of rotten manure to the roots will then have the effect of producing young wood of the right character.

Gooseberries.—Bushes from which the fruit is always gathered in a green state may be permitted to become rather close; but with regard to dessert varieties, upon which the berries have to hang some length of time, the conditions must be quite other-

wise. The bushes for each purpose are best grown in separate breaks, or in two divisions upon the same break. The Gooseberry is now much grown as cordons, and trained to wire-trellises, and for dessert varieties this is the best system. They may also be grown against walls, and the variety Warrington will succeed on a northern aspect in all of the warmer counties. Cordons should be pruned as recommended above for cordon Currants. In the case of bushes, thin out the crowns as much as needed, and remove all lower branches tending to grow in a downward direction. Then spur in the side growths, and leave the leading shoots one-half or two-thirds their length. Gooseberries, like Currants, should be extended in an upward direction as far as possible. If it is wished to increase the stock by cutting, select well-ripened shoots of medium length. Tie them into bundles and label them. It is quite time they were made, and when ready, plant them in trenches 2 feet apart in prepared ground.

PLANTS UNDER GLASS.

By T. EDWARDS, Plant Foreman, Royal Gardens, Frogmore.

Stove Plants.—*Codiaeums* or *Crotons* requiring more rooting space should be repotted, using a compost of light fibrous peat, with sand and broken charcoal. They require plenty of heat, light, and moisture. Following the disturbance of repotting, a slight shading may be necessary, but later, none whatever. Cuttings, or tops which have been "rung," will now be rooted and fit for potting, but this operation may be performed at any time; a good coloured branch makes a useful-sized plant in a very short time. Such varieties as *Reidi*, *Prince of Wales*, &c., need much root-room, and should make rapid growth early in the season, in order to develop the beautiful colours of the leaves. After potting plunge them into bottom-heat if possible, and syringe them frequently. Until the pots have been well filled with roots again, afford water only after very careful examination. Proceed with the potting and propagation of *Cordylines* (*Dra-cenae*), *Aralias*, &c. Palms, whilst in a young state will grow well in any light compost, but in the case of larger plants a more lasting material needs to be used, and if carefully potted, they will continue in good health for several years. For *Kentias*, *Cocos*, *Arecas*, *Latantias*, *Thrinax*, &c., use a compost of two parts fibrous loam and one part peat, with sufficient sand to keep the whole porous, and make it very firm with a potting-stick. An occasional top-dressing with an artificial manure may be given subsequently, and a free use should be made of the syringe. They are not much troubled with insect pests; the worst is white scale, and this can only be destroyed by sponging the plants carefully with soft-soap and paraffin, or with some other equally satisfactory insecticide. Palms should be sponged occasionally, even if free from insects; it will improve their appearance. A night temperature of 60° to 65°, or during the present cold weather a few degrees lower, will be sufficient. More or less shade is requisite to keep the foliage in good colour.

Bamboos are most useful if much indoor decoration has to be done, and their growths are also valuable for placing in large epergnes, or on staircases, &c., where there is little room for a pot. When used in a cut state the stems should be placed in water immediately, or the leaves soon shrivel. Division of root-stocks and repotting may now be done, using a rather strong loam; the temperature of the greenhouse will be sufficient.

Gloxinias.—Shake out and repot these in a compost of loam, leaf-mould, dried cow-dung, and sand.

Achimenes may be started in pans or boxes of light mould, or cocco-fibre dust and sand. When the stems have become 2 inches in length, pot them up, placing eight or ten corms in a 6-inch pot. *Achimenes* make beautiful objects when grown in wire baskets for the conservatory. If the plants are to be transferred to baskets, place some moss or fibrous loam on the bottom, then a ring of *Achimenes*, with the growing points towards the exterior of the basket, cover the roots with light sandy mould, add more moss, then another ring of plants, and so on, until the basket is full. Place the plants on the surface at 2 inches apart. They should be grown in an intermediate-house, and may be suspended in the conservatory as soon as the flower-buds are visible.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, FEB. 13.—Royal Horticultural Society's Committee Meetings, and General Annual Meeting.

THURSDAY, FEB. 15.—Linnean Society's Meeting.

SALES.

MONDAY, FEB. 12.—Fruit Trees, Roses, Hardy Perennials, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, FEB. 14.—Japanese Lilies, Continental Plants, Tuberoses, Roses, &c., at Protheroe & Morris' Rooms.

FRIDAY, FEB. 16.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—59°.

ACTUAL TEMPERATURES:—

LONDON.—February 7 (6 P.M.): Max. 37°; Min. 27°.

PROVINCES.—February 7 (6 P.M.): Max. 40°, Land's End; Min. 27°, Peterhead.

West Indian. The second West Indian Agricultural Conference was opened on January 6 last, at Barbados, under the presidency of Dr. D. MORRIS, C.M.G., Imperial Commissioner of Agriculture for the West Indies. There were forty representatives present, including the heads of all the botanical, chemical, and educational departments, as well as representatives of the principal agricultural societies in the West Indies. The Governor of Barbados, Sir JAMES HAY, K.C.M.G.; Sir GEORGE PILE, Sir CONRAD REEVES, the members of the Legislature, and the principal planters were also present. In his address, Dr. MORRIS spoke hopefully of the operations of the past year, but admitted that the difficulty of permanently influencing West Indian agriculture in its present condition was enormous, and it required active and united action for some years to deal with it.

The prominence given to subjects tending to restore the sugar industry was cited, as fully carrying out the recommendations of the Royal Commission. Several new canes, notably, that known as "B. 147," had maintained their position, and were regarded by the planters as most valuable varieties; the amount of available sugar was at the rate of 3½ tons per acre.

Central factories for the improved manufacture of sugar in Barbados, Antigua, and St. Kitts, were again strongly advocated—in fact, without them it was impossible to place the sugar industry in these islands on a sure basis. Reduction in the cost of cultivation was recommended by the more general use of green manuring to replace some of the costly arti-

ficial manures now used; by extending the use of silos to supply fodder during periods of drought; by the more general planting of rotation and catch crops, thus saving the purchase of imported food stuffs and supplies; and by associating dairying with cane-growing, and raising pigs and small stock.

Subsidiary industries such as Cacao, &c., were recommended in suitable localities in British Guiana, St. Lucia, and Dominica; also Coffee, fruit, and India-rubber. Agricultural education has been actively organised, and it was confidently anticipated the foundation was laid for a larger measure of prosperity for all classes, white and black, than had been possible in any previous portion of the history of the West Indian colonies.

The Conference resumed on January 8, at 9 o'clock. After discussing the desirability of controlling and diminishing the spread of destructive pests in the West Indies, Educational subjects were considered. Great interest was created by papers read by Mr. DEIGHTON and the Rev. J. R. ROCCO (Barbados), Mr. W. FAWCETT and Canon SIMMS (Jamaica), and Mr. HART (Trinidad). An animated discussion followed, in which Colonel HICKS (Jamaica), Mr. W. BLAIR (British Guiana), Mr. J. C. COLLENS (Trinidad), and others took part. In the afternoon the Hon. F. WATTS contributed a valuable paper on "Food supplies of the Leeward Islands," and read a paper on behalf of Dr. NICHOLLS (Dominica) on "Botanic Stations in the West Indies." Several other papers were read, and the Conference, after a cordial vote of thanks to Dr. MORRIS, rose at 4.30. Afterwards, the President held a special meeting to confer with the representatives from British Guiana, and another with the Inspectors of Schools. A meeting of the Chemical Section sat, with Professor HARRISON as Chairman, to consider special questions referred to it. The Conference was unanimously regarded as the most successful yet held in the West Indies.

HYMENOCALLIS MORITZIANA, KUNTH.—This species of Hymenocallis, although introduced to European gardens a few years ago, is as yet but little known to gardeners. It is a compact, handsome, evergreen plant, with erect, Eucharis-shaped leaves, 2½ feet in length, with petioles equally as long as the blades. The flowers are white, fragrant, with very long tubes of a greenish tint, green filaments and styles. They are borne in an umbel of twenty or more, and appear early in the year, opening successively in two's, the display being kept up for a fortnight. Individually, they last about three days before collapsing. As in all species of Hymenocallis, the leaves and flowers vary in size on different plants, some of the forms of each species running so close to other species as to render their identification a matter of difficulty. The only species likely to be confounded with the one under notice is *H. eucharidifolia* (Baker), which is smaller in all its parts, and has a very stout neck composed of the sheathing bases of the alternately arranged leaves. The leaves of *H. Moritziana* are distichous, or nearly so. The treatment required by this plant is similar to that afforded *Eucharis*, but it must not be rested, as growth takes place at all seasons. In 1894, *H. Moritziana* was fairly common near the coast in Venezuela to the W. of La Guayra, at which place the plant illustrated (fig. 28, p. 89) was collected. It flowered in the collection formed and owned by A. WORSLEY, Esq., of Mandeville House, Isleworth.

VICTORIA MEDALLISTS OF HONOUR.—The death of Mr. JOHN FRASER causes a vacancy in the list of the Victoria Medallists of Honour.

MR. HARCOURT WEBB AND MR. FRANK WEBB, sons of Colonel WILLIAM G. WEBB, of Wordsley, Stourbridge, who, after holding Commission in the 1st South Staffordshire Volunteer Battalion, recently joined the Imperial Yeomanry, embarked for South Africa on Saturday, Jan. 27. Their many friends in the Stourbridge district abound in good wishes for them, and in the hope for their safe and early return.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will take place in the Drill Hall, James Street, Westminster, on Tuesday, February 13. The various committees will assemble at noon, as usual, and at 3 o'clock the annual general meeting of the Society will be held at the Society's Offices, 117, Victoria Street, Westminster, S.W. The Council of the Royal Horticultural Society at its last meeting unanimously requested the President, Sir TREVOR LAWRENCE, Bart., to allow himself to be appointed to the vacant Victoria Medal of Honour.

NATIONAL ROSE SOCIETY.—A meeting of the general purposes committee will be held at the Rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 13th inst., at 2 P.M. A meeting of the committee will be held at the same place and day at 3 P.M. H. HONYWOOD D'OMBRAIN, EDWARD MAWLEY, hon. secretaries. The matters for the consideration of the committee are:—Report of General Purposes Committee; Salisbury Schedule; Birmingham Schedule; Judges for Salisbury Show; Judges for Birmingham Show; Provincial Exhibitions in 1901; Girdlestone Memorial Fund, Crystal Palace Schedule, and other business.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the Lecture Hall of the Institution on Monday, February 12, 1900, when a paper will be read by Mr. H. T. SCOBLE (Professional Associate), entitled "The Bacteriological Treatment of Sewage." The chair will be taken at 8 o'clock. The annual dinner of the Institution will be held at the King's Hall, Holborn Restaurant, on Wednesday, February 21, 1900, at half-past six o'clock precisely.

LINNEAN SOCIETY.—On the occasion of the evening meeting to be held on Thursday, Feb. 15, 1900, at 8 P.M., the following papers will be read: I., Photography of British Plants, by Mr. J. C. SHENSTON; II., A New Land Planarian from the Pyrenees, by Dr. R. F. SCHARFF, F.Z.S.

THE NATIONAL CHRYSANTHEMUM SOCIETY.—Mr. R. DEAN was unanimously re-elected Secretary on Monday last. The attempt of the Executive Committee to prevent delegates from affiliated societies voting upon that Committee on questions other than those affecting such societies, was defeated. A report of the meeting will be found on p. 94.

EXHIBITION SCHEDULES TO HAND.—We have received the prize list and rules for the spring and autumn exhibitions to be held by the Royal Caledonian Horticultural Society in the Waverley Market, Edinburgh. The spring exhibition is to be held on April 4 and 5. The autumn show, which invariably attracts considerable attention, and is the best exhibition held in the North, was first arranged to be held on September 5 and 6, and is shown for these dates in the almanac published with our issue for January 6. We note, however, that the event has been postponed until September 12 and 13. Smaller exhibitions will be held on May 2 and July 11. The shows are open to exhibitors from any part of the country, whether members of the Society or not, and the prizes offered are of a very liberal character. The Secretary is Mr. P. MURRAY THOMSON, 5, York Place, Edinburgh.

THE WEATHER IN CORNWALL.—The total rainfall at this place during the past month

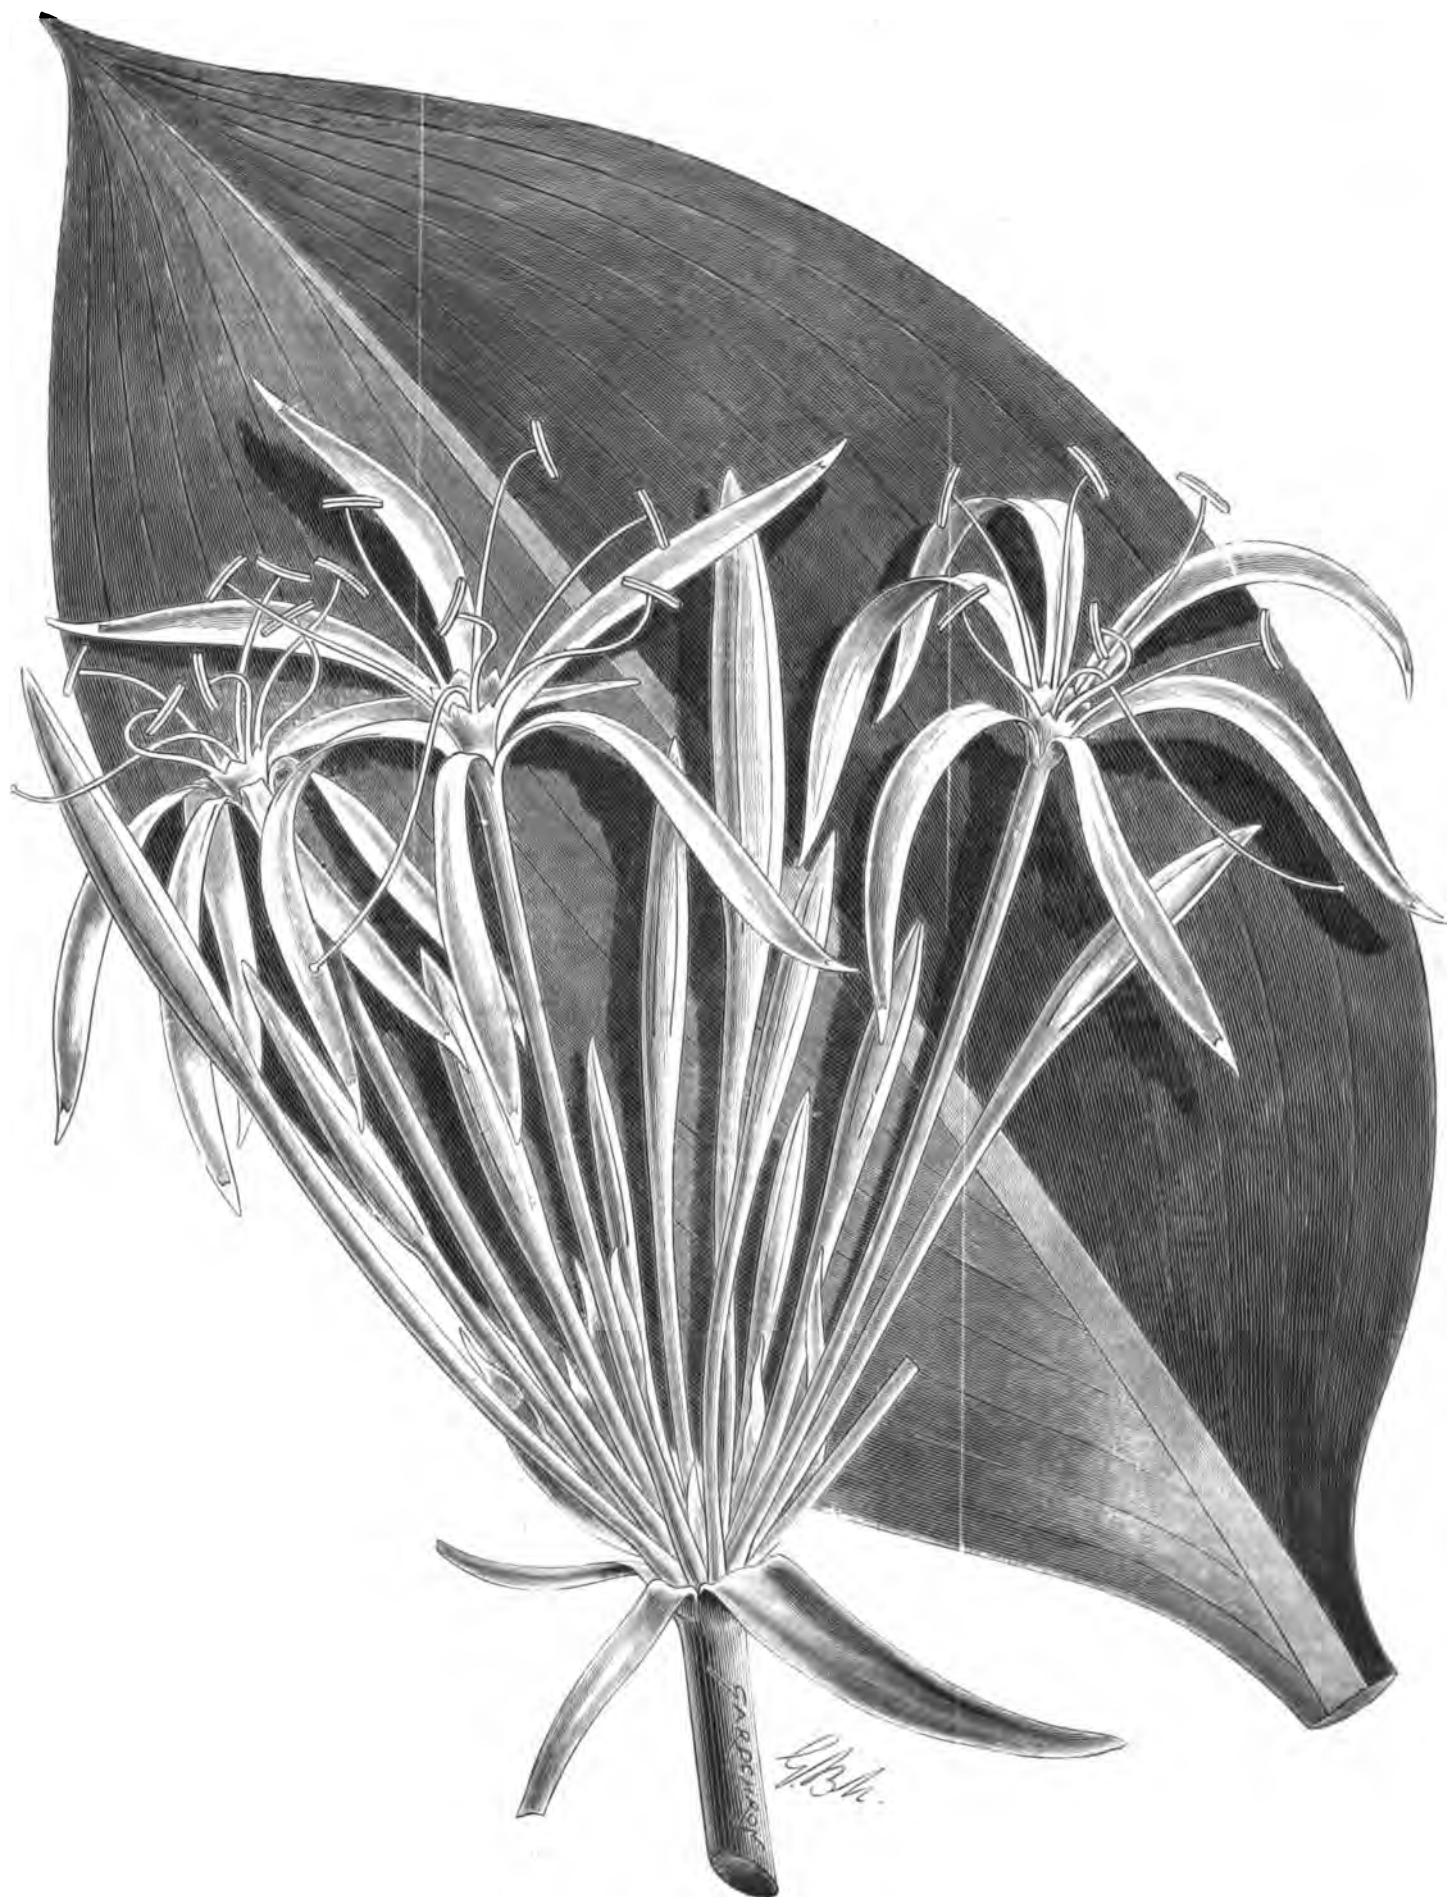

FIG. 23.—HYMENOCALLIS MORITZIANA: FLOWERS WHITE, WITH GREENISH TUBES, FILAMENTS, AND STYLES.
(SEE P. 88.)

amounted to 6.47 inches. The greatest fall in twenty-four hours was 1.24 inches, measured on Sunday, January 7, at 9 A.M. The temperature has ranged from 26° Fah., on January 5, to 53° on January 1, which latter amount was also registered on January 8, 21, and 25. A. C. B., Pencarrow, Bodmin.

TESTS OF PARIS-GREEN.—In a *Bulletin* lately sent out by the University of California, Agricultural Experiment Station, dealing with Paris-green for the Codling-moth, Messrs. C. WOODWORTH and GEO. COLBY publish the following summary of experiments with Paris-green and other arsenical spraying materials:—

"First.—That many Paris-greens nowadays contain large amounts of free water-soluble arsenious oxid, the manufacture and sale of which should be discontinued, but because these materials have proven injurious and unsatisfactory in horticultural work, and because they constitute a very obscure form of fraud upon the purchaser.

Second.—That the microscopic examination of a Paris-green affords sufficient evidence for rejecting it, if it contains as much as 6 per cent. of free arsenious oxid; and above this figure there is no question of the great value of this rapid and excellent test.

Third.—That adulteration in the sense of added foreign matter to Paris-green (e.g., barium carbonate, calcium carbonate and sulphate), is rarely practised in this country, at least by the manufacturers.

Fourth.—That the newer spraying materials, from the evidence at hand, with the exception of the very injurious barium compound and the paragne, will doubtless prove acceptable, and cheap substitutes for Paris-green, if the quantity of free arsenious oxid, especially in the green one, is better governed by proper methods of manufacture."

RICHMOND HORTICULTURAL SOCIETY.—At a meeting duly held on Thursday, February 1, 1900, THOMAS SKEWES-COX, Esq., M.P., Chairman, in the chair, the following resolution was proposed by him, seconded by Sir EDWARD HERTSLET, K.C.B., and unanimously adopted:—That the Richmond Horticultural Society hereby places on record its deep regret at the loss which has befallen horticulture by the death of His Highness the Duke of TECK, G.C.B., G.C.V.O., a Prince who for no less than twenty-six years past had been the President and valued friend and supporter of this Society; and begs to tender sincere and respectful sympathy to their Royal Highnesses the Duke and Duchess of YORK, and the other members of the late President's family, in their heavy bereavement.

LUPINS FOR GREEN-MANURING.—A *Bulletin*, by J. BURTT DAVY, from the University of California, has been issued with the above title. The author gives a bad character to all species of this plant, saying that:—"The Yellow Lupin is considered much more poisonous than the large White, and the Perennial Lupin less so than any other species. In using any species for forage, great care must be taken not to use much at a time, especially of the seeds, and not to use a Lupin ration without intermission. In the event of any cases of 'lupinose' appearing, the use of Lupin should be abandoned entirely. Lupin should never be used exclusively in a ration. For forage purposes the Lupins, therefore, do not appear to offer any advantages over other leguminous crops, except as winter growers, and they are certainly more or less dangerous, and not to be recommended indiscriminately."

CROPS AT THE CAPE.—We have received from the Under-Secretary for Agriculture at Cape Town the preliminary report for the year 1898-99 of the department relating to the output of Wheat, Barley, Oats (seed or grain), Oat-Hay, Rye, Mealies, Kaffir-Corn, Potatoes, red and white wine, and brandy. In the communication accompanying the report, the courteous Under-Secretary says: "Owing to the unsettled state of affairs the

publication has been much delayed, and even now (January 15), in some instances the figures are incomplete." When the fully-fledged report is issued we will hope to find in it the figures relating to orchards and vineyards, which are always of interest to readers here.

"BOTANICAL MAGAZINE."—The plants figured in the February number are:—

Eucalyptus ficifolia (F. v. Muell.), tab. 7697.—"Hardly anything can be more gorgeous than forests of this tree, seen at the end of January and beginning of February, when the flowers diffuse a rich red hue over the dark green foliage of the landscape." The plant grows well in the conservatory of Mrs. FITZROY FLETCHER, of Letham Grove, Arbroath, N.B., where it flowers every year in August. It has lanceolate acuminate leaves, and large terminal loose panicles of pink flowers. The illustration was taken from a plant that flowered at Kew. The native country is a very narrow area in the extreme south-west point of Australia.

Lomatia longifolia (R. Br.), tab. 7698.—An evergreen shrub with narrow whitish-green leaves, and loose terminal panicles of white Grevillea-like flowers. Native of South-eastern Australia. It was introduced as early as 1816.

Phlomis lunariifolia (Sibthorp), tab. 7699.—A very handsome shrubby Labiate, not unlike the old *P. lanata*, but with larger flowers. Flowered in June, 1899, at Kew, from seeds sent by E. WHITTALL, Esq., Smyrna.

Ariema flavum (Schott), tab. 7700.—A tuberous-rooted species with pedate leaves. The short tubular portion of the small spathe is pitted, the laminar portion rounded acuminate, green, with purple stripes. Western Himalayas. Kew.

Iris obtusifolia (Baker), tab. 7701.—A Persian species, with short, oblong, obtuse leaves and yellowish flowers. The "falls" are striped, and bearded at the base.

EUONYMUS JAPONICUS IN FRUIT.—From a correspondent signing himself "An Old Kewite," who described in our issue for January 20, pp. 45, 46, how very freely the *Euonymus* fruits in an exposed situation on the Cornish coast, we have since received a small branch of this shrub, which fully bears out his description. The branch is clothed abundantly with seeds covered with a bright red aril, just emerged from their dull purple capsules.

FRUIT PARCELS BY RAIL.—In a recent issue we gave figures furnished by the Great Eastern Railway Company respecting the carriage of small parcels of farm and garden produce over their line during the past and several preceding years. The following information, from the traffic-manager of the South-Eastern and London, Chatham & Dover Railway, possesses some extra importance:—"From May 1, when we entered into the arrangement in connection with the consignment of farm, &c., produce, until the end of December, we have carried 6924 packages in the special boxes; but regret to say the arrangement is not made use of to the extent I anticipated—in fact, parcels which would certainly not come under the head of 'farm-produce,' are found to be carried under the 'farm-produce' conditions." Nothing need be added here.

"THE FLORA OF CEYLON."—The fifth and last part of the handbook to the *Flora of Ceylon* has just been published by DULAU & Co. The work was commenced by our much regretted friend, Dr. TRIMEN, and has been continued since his death by Sir JOSEPH HOOKER, whose energy has not shrunk from the toilsome task. The enumeration and description of the grasses are entirely the work of Sir JOSEPH, as Dr. TRIMEN left no MSS. relating to this order. Analytical keys to the orders and genera are given. Mr. A. F. BROWN contributes an account of the "Forests and Waste Lands of Ceylon." Mr.

LEWIS has an appendix on the distribution of the rainfall in Ceylon; and Prof. BOULGER one on the history of Ceylon Botany. Full indexes to botanical and native names are given, as well as various maps. Sir JOSEPH HOOKER may be congratulated on this his latest contribution to botanical science.

AUSTRALIAN SALT-BUSHES (ATRIPLEX).—Australian Salt-bushes form the subject of a *Bulletin* from the University of California Agricultural Experiment Station, by Messrs. C. SHINN and M. E. JAFFA. According to the Summary of results, "This bulletin shows that the California Station has been experimenting with Salt-bushes for eighteen years; that the tests of some species have extended over the greater part of the State, and that *Atriplex semibaccata* is the most generally useful species of all that have been planted, although others are worthy of cultivation. It shows that *semibaccata* grows on strong alkali soil, furnishing a very large amount of satisfactory pasturage or fodder; that it also thrives on arid, non-alkaline uplands, even where wells have to be sunk 200 feet to water, and where the annual rainfall has been less than 5 inches. While the dwarf, bushy species, such as *vesicaria*, will also thrive on such uplands, they seem to furnish less pasturage than *semibaccata*. The Salt-bushes are of easy, rapid growth, and are hardy under California conditions. Reported from Australia as enduring 14° Fahr., without injury, some of the American tests would indicate that *semibaccata* will stand considerably more cold than this. The tolerance of brackish ground-water, and the extreme northern limits of growth are still undetermined."

A NEW RUBBER PLANT.—The *Semaine Horticole* of January 13 publishes an illustration and a figure of a new species of *Ficus*, signed F. Eetveldiana, L. Linden. It is a moderate-sized tree, growing in the Belgian Congo. The leaves are on long slender stalks, the blades cordate oblong. It will form a fine shade tree in the tropics, and grows rapidly under cultivation.

"HOME AND GARDEN."—Readers who recall Miss JEKYLL's *Wood and Garden*, with its freshness and valuable hints, will be glad to learn that a second volume from the pen of the same author has just been issued, and is published by LONGMANS. We shall have another opportunity of alluding to the book later on.

"THE ORCHID REVIEW."—"It has, however, been pointed out to the editor that the work would have a still wider influence if the price were reduced to 6d., under which circumstances many gardeners would subscribe who at present find the cost prohibitive. A reduction in price would necessitate a corresponding increase in the number of subscribers, and with the co-operation of our readers we believe that this alteration can be effected."

THE MIDLAND CARNATION AND PICOTEE SOCIETY.—The ninth annual report of this Society contains a full list of Awards made in 1899, and a list of subscribers and balance-sheet. Also a schedule of prizes offered, and rules to be observed at the forthcoming exhibition, together with lists of choice varieties of Carnations, and hints upon their cultivation. The exhibition in 1900, it is hoped, will be held in the Botanical Gardens, Edgbaston, Birmingham, on August 1 and 2. Unforeseen circumstances, however, may necessitate a change being made in these dates. The hon. secretary is Mr. HERBERT SMITH, 22, Tenby Street North, Birmingham.

THE NEW YORK BOTANICAL GARDEN.—The first number of the journal of this institution has been issued under the editorship of Mr. D. T. MACDOUGAL, Director of the Laboratories. An illustration is given of the museum building, which has a frontage of 308 feet, whilst the height to the top of the dome is 110 feet. A lecture-room large

enough to hold 700 persons is provided, as well as libraries, herbaria, laboratories and museums; the latter combining the features of those at Kew and at the Natural History Museum.

JUNCUS ZEBRINUS.—According to an article in the *Revue Horticole*, this banded Rush, originally introduced by Mr. W. Bull, is a form of *Sarpis lacustris*, as proved by the flowers which have been produced.

PUBLICATIONS RECEIVED.—From the University of California, Agricultural Experiment Stations: Bulletin 124, *Lupinus for Green-Manuring*; No. 125, *Australian Salt-Bushes*; and No. 126, *Paris Green for the Codlin Moth*.—*A Handbook to the Flora of Ceylon*, Part 5 (Dulau).—*The Botanical Magazine*, Tokyo.—*Bulletin of Miscellaneous Information, Royal Gardens, Kew*, Appendix iv., 1899.—*Catalogue of the Library Additions received during 1898*.—*Transactions of the English Arboricultural Society*, vol. iv., part ii. (Simpkin, Marshall & Co.).—*Journal of the New York Botanical Garden*, vol. i., No. 1.—*Die Pflanzen Welt Deutsche Südwest Afrika*, von Prof. Dr. Hans Schinz (Mémoires de l'Herbier Boissier).—*Canadian Horticulturist*.—*Icones Selectae Horti Shenensis*, tom. i., fasc. 2.—*Phanerogamæ et Pteridophytæ japonicæ iconibus illustratæ*, by Prof. T. Makino.—*Cryptogamæ japonicæ iconibus illustratæ*, Tokyo.—*The Potamogetons of the British Isles*, by Alfred Fryer (Lovell, Reeve & Co.).—*Jack and Jill's Journey*, by Phoebe Allen (Wells, Gardner, Darton & Co.).—*Home and Garden*, by Gertrude Jekyll (Longmans).

ROYAL HORTICULTURAL SOCIETY.

THE Society has, in anticipation of the Annual Meeting, to be held on Tuesday next, published its Annual Report for the year 1899-1900, from which we take the following particulars:—

"The year 1899-1900 has been one of continued prosperity for the Society.

THE LINDLEY LIBRARY.

A large sum of money has been spent on the Lindley Library in recent years, and the Council have now had the books enclosed in glass-fronted cases for the double purpose of preservation and cleanliness. This has greatly improved the appearance of the library.

A catalogue has been published at the price of 2s. 6d., in the hope that many Fellows would purchase it, not only to inform themselves what books the library contains, but also because it forms in itself a reference-list to the bibliography of gardening. It would be gratifying if Fellow-would also take note of books still wanting to the library, with a view to presenting them.

During the past year valuable books have been presented by the Director of the Royal Gardens at Kew, Dr. Maxwell Masters, F.R.S., Miss M. J. King, the Rev. Professor Henslow, V.M.H., Mons. Correvon, Mons. Bois, and others, to all of whom the best thanks of the Society are due. A full list will be published on April 1 in the Society's Journal, vol. xxiii., part 3.

A corrected list of the awards made by the Society to plants, flowers, fruits, and vegetables to the end of 1899 is being prepared, and will be issued during the coming year.

Application is frequently made to the Society by Fellows desiring to have special advice respecting their gardens. The Council have therefore resolved to add a right to this to the privileges of Fellowship, and to send a competent Inspector to report and advise at the following charges, viz.: a fee of

£2 2s. for one day (or £3 3s. for two days, when necessary), together with all out-of-pocket expenses. No inspection may take up more than two days.

Under the head of ordinary expenditure at Chiswick, £1,810 has been spent on the general work and maintenance of the gardens. The receipts by sale of surplus produce amount to £330, making the net ordinary cost of the gardens £1,480.

At Westminster, twenty-one Fruit and Floral Meetings have been held in the Drill Hall, James Street, Victoria Street, besides the larger Shows in the Temple Gardens on May 31, June 1 and 2; and at the Crystal Palace on September 28, 29, and 30. An International Conference on Hybridisation was held at Chiswick and Westminster Town Hall on July 11 and 12. Lectures and demonstrations have been delivered at nineteen of the Meetings.

The number of Awards granted by the Council, on the recommendation of the various committees, amounted to 931 in all.

THE SCIENTIFIC COMMITTEE.

The Council desire to draw the attention of Fellows of the Society to the more extended use which the Scientific Committee might be to them if they availed themselves more freely of their privileges in submitting instances of diseases of, or injuries to plants, caused by insects or otherwise. The Scientific Committee is composed of gentlemen qualified to give the best advice on all such subjects, either in respect to the prevention or cure of disease. The committee is also glad to receive specimens of any subjects of horticultural or botanical interest.

THE TEMPLE SHOW.

The Society's great show held in May (by the continued kindness of the Treasurer and Benchers) in the Inner Temple Gardens, was as successful as ever, and it is a matter of satisfaction to the Council to find that this meeting is now universally acknowledged to be the leading horticultural exhibition of this country. The best thanks of the Society are due to all who kindly brought their plants for exhibition, or otherwise contributed to the success of this show.

THE HYBRIDISATION CONFERENCE.

The International Conference on Hybridisation held at Chiswick and at Westminster Town Hall, on July 11 and 12, was considered both by our home and also by our foreign guests to be an unqualified success, not only from the value of the papers read and communicated, but also from the pleasant opportunity it afforded for the meeting of horticulturists from all parts of the world. The report of the Conference has been unavoidably delayed. It will form a distinct and very valuable volume of the Society's Journal.

THE CRYSTAL PALACE FRUIT SHOW.

The exhibition of British-grown fruit held by the Society at the Crystal Palace on September 28, 29, and 30, was, considering the very unfavourable season, most satisfactory. Full particulars will be found in vol. xxiii., part 3, of the Journal, which will be issued in the course of a few weeks.

As an object-lesson in British fruit cultivation, this annual show stands unrivalled, and is of national importance. Those who have visited it from year to year cannot fail to have been impressed by the wonderful advance which has been made in the quality of the hardy fruits exhibited. And as the importance of fruit-growing in this country cannot well be over-estimated, the Council invite Fellows and their friends to support them in their efforts to maintain and improve this exhibition by visiting it, and by subscribing to its funds. For it cannot be too widely known that the continuance of the show is absolutely dependent on at least £100 being raised by subscription each year towards the prize fund. The show involves the Society in a very large expenditure without the possibility of any financial return. The Council have therefore established the rule that they will

not continue it unless sufficient interest in it is taken by Fellows and their friends to provide £100 towards the prize fund. And this will in the coming year 1900, be even more important than heretofore, as the directors of the Palace have signified to the Council that they feel compelled to decrease their contribution by £50. A glance at the list of subscribers will show how small has been the interest taken by the bulk of the Fellows. The Council would point out that this is not a local show with a few large prizes, but that a multitude of small prizes have been arranged in order to secure the best fruits in each section; special prizes have been allotted to market-growers; and counties have been grouped in such a way that growers should not have to compete with exhibitors from localities more favoured by climatic conditions. These points will be still further extended should sufficient financial support be forthcoming. Subscriptions should be sent at once to the Secretary, 117, Victoria Street, Westminster; and if the list prove satisfactory, the schedule will be issued in April, and the show held on September 27, 28, and 29, 1900. The list of subscribers for 1899 will be published in part 3, of vol. xxiii., of the Society's Journal.

DAFFODIL SHOW AT TRURO.

An invitation was received and accepted for sending a deputation to visit a show of Daffodils and other early spring flowers and produce, held at Truro on March 21 and 22, 1899. The Council desire to express their best thanks for the great courtesy and hospitality with which their deputation was received in Cornwall.

THE "JOURNAL."

The Journal of the Society has been continued so as to enable Fellows at a distance to enter more fully into, and reap the benefits of the study and work of those actively engaged at headquarters. Vol. xxii., part 4, and parts 1 and 2 of vol. xxiii., were issued during the year; vol. xxiii., part 3, will be ready on April 1; and vol. xxiv., on the Hybrid Conference, as quickly as possible.

THE EXAMINATIONS.

An examination in the principles and practice of horticulture was held on April 11, concurrently in different parts of the United Kingdom; 165 candidates presented themselves for examination.

It is proposed to hold a similar examination in 1900, on Wednesday, April 25. Candidates wishing to sit for the examination should make application during February to the Secretary, Royal Horticultural Society's office, 117, Victoria Street, Westminster, S.W.

The thanks of the Society are due to all the members of the Standing Committees—viz., the Scientific, the Fruit and Vegetable, the Floral, the Orchid, and the Narcissus Committees, for the kind and patient attention which they have severally given to their departments.

The thanks of the Society are also due to all those who, either at home or abroad, have so kindly presented plants or seeds to the gardens. A list of the donors has been prepared, and will be found in the Society's Journal, vol. xxiii., part 3, which will be issued on April 1.

The Council wish to express, in their own name and in that of the Fellows of the Society, their great indebtedness to all who have so kindly contributed, either by the exhibition of plants, fruits, flowers, or vegetables, or by the reading of papers, to the success of the fortnightly meetings in the Drill Hall. They are glad to find by the increased and increasing number of visitors that the Society's fortnightly meetings are becoming fully appreciated by the Fellows and public in general.

A very courteous proposal has been received from the Richmond Horticultural Society inviting the Council, with the Fruit, Floral and Orchid Committees, to sit at Richmond on the occasion of the local Society's show in the Old Deer Park, on Wednesday, June 29. This invitation has been cordially accepted, and the Committees will sit,

and plants, &c., will be brought before them for certificate, exactly as if they were sitting at Westminster.

THE CHARTER.

Ever since the great revival of the Society in 1887, questions have from time to time arisen as to the legality of certain of the bye-laws. It has been urged that this or that bye-law was *ultra vires* because it was apparently in conflict with the Charter. And when recourse was had to the two Charters under which the Society is incorporated, the later (and therefore presumably the ruling) Charter was found to be so encumbered with matters relating solely to the South Kensington lease from the Commissioners of the 1851 Exhibition (which matters ceased in 1887 to have any further connection with the Society), that it seemed well-nigh impossible to separate the small residuum of the Charter that was still applicable to the Society's altered position, from the mass of enactments which had become obsolete and irrelevant.

There appeared to be only two alternatives, either to abide by the existing bye-laws, or to petition Her Majesty to grant a new Charter. The expense involved in the latter course has hitherto been an obstacle, but at the beginning of the present year, 1899, the condition of the Society's finances appeared to the Council to be such as to warrant a petition being made to Her Majesty for a new Charter, and a considerable part of the year has been employed in drawing it up. The petition to Her Majesty and a draft of the new Charter were submitted to a general meeting of the Society held on June 21, 1899, and were unanimously adopted and ordered to be sealed with the Society's seal and presented to Her Majesty the Queen.

The Council have much pleasure in announcing that on the advice of the Privy Council, Her Majesty acquiesced in the petition, and on Nov. 14 signed the supplemental Charter, and ordered it to be sealed with the Great Seal of the Kingdom.

The Council have appointed a committee to draw up a draft of new bye-laws, which they hope to lay before a general meeting at no distant date.

THE CENTENARY.

The subject of the celebration of the approaching centenary of the Society in March, 1904, is naturally attracting considerable attention. After the consideration of various excellent projects (some of which, however, appeared impracticable on account of their expense), the Council have decided to recommend the acquisition of a new garden in the place of Chiswick as being, under all the circumstances, the best and most practical method of celebrating the centenary. A garden for experiment and trial is an absolute necessity for the Society, and Chiswick has recently become so surrounded with buildings, and the atmosphere so heavily charged with smoke, that not only has the difficulty of cultivation enormously increased, but it is feared that the results obtained from the trials are rapidly ceasing to be reliable. It is therefore proposed to issue an appeal to all the Fellows, and to raise a fund for the purchase of a more suitable site for a garden, in memory of the first hundred years of the Society's existence.

The Council fully recognise the advantage of the Society's possessing a hall of its own in which plants, flowers, and fruits can be seen by the Fellows under more favourable conditions, as regards light and space, than are possible in the building at present used for the meetings. They do not, however, as yet see their way to its attainment, but will be happy to consider any suggestions concerning it.

The numerical increase in the list of Fellows is no less than 580, showing a net increase in income of £748 2s. 6d. The accounts show a gross expenditure of £6069 7s. 1d.; £1810 10s. being expended on Chiswick. The total receipts amount to £7820 15s. 10d., so that a balance is carried forward to the General Revenue account of £1751 8s. 9d.

As the provisions of the new Charter require

that three members of the Council shall resign every year, the Council have decided that one vacancy having occurred already by the lamented death of Mr. Sydney Courtauld, the other two vacancies shall be created by the resignation of Sir John T. D. Llewelyn, Bart., M.P., and of R. McLachlan, Esq., F.R.S.

Under the new Charter retiring members of Council are eligible for re-election. The following gentlemen have been duly nominated to fill the vacancies, viz.:—F. du Cane Godman, Esq., F.R.S.; Sir John T. D. Llewelyn, Bart., M.P.; Arthur W. Sutton, Esq., V.M.H. The following have been nominated for re-election as officers, viz.:—Sir Trevor Lawrence, Bart., V.M.H., President; Philip Crowley, Esq., F.L.S., F.Z.S., Treasurer; Rev. W. Wilks, M.A., Secretary. No other nomination having been received, there is no occasion under the new Charter to issue a balloting sheet. By order of Council, *W. Wilks, Secretary.*

HOME CORRESPONDENCE.

BEAUTIFUL FRUIT TREES.—Many times in the *Gardeners' Chronicle* has the planting of hardy fruit trees as objects of beauty and decorative value been recommended, and not without sufficient reason has this advice been given. Many of the hardy fruiting *Prunus* and *Pyrus* in the spring time equal, if not surpass, in effect other trees that are cultivated for their flowering qualities only. Most persons know what a perfect picture of beauty a fruit garden usually presents in early spring, when the trees are in full flower; not even the collection of ornamental *Prunus* and *Pyrus* at Kew, when at its best, can show such a wealth of bloom. But in addition to their decorative value in the early part of the year, our fruit trees have the important advantage of being most useful in the autumn. In the first place we have the fruits; but in addition there is a remarkable variety of finely-tinted autumn foliage to be found amongst them, more particularly in the genus *Pyrus*. It is a remarkable fact, too, that those varieties which produce the finest and best flavoured fruits are usually the most finely tinted leaves in the autumn. The range of colour in autumn is from light yellow, through many shades of orange and red to deep crimson. When one has observed for some time the tints produced by certain varieties, it is quite possible to recognise many of them by the colour of their foliage alone; indeed, to obtain the best results from a decorative point of view, it is most necessary to be well acquainted with these before planting. One of the most distinct, and perhaps the deepest coloured of all, is *Pear Fondante d'Automne*; its leaves become very dark crimson, almost black. A greater contrast that would be produced by planting *Beurré Hardy* close by could scarcely be obtained, for the latter remains a rich yellow, usually faintly tinged with red. That deservedly favourite variety—*Thompson's*—has a most peculiar, yet withal, a striking tint, in many of the leaves black predominates, whilst in others it is yellow, or pale red, or sometimes all three are present together. *Doyenné Boussoch*, a useful early *Pear*, with leaves somewhat similar in shape to those of *Rhus Cotinus* (the smoke or wig plant) almost rivals the remarkable autumnal colouring of the latter. A charming effect is produced by the distinct oval leaves of *Pitmaston Duchess*, in which yellow, both light and deep, and crimson, are finely blended together. *Pasé Colmar* is another *Pear*, the foliage of which changes to a very dark tint; *Napoleon*, again, from yellow, gradually develops into a fine deep crimson. In *Gregoire Bourdillon* the yellow veins become prominent on a background of red and yellow, giving a beautiful streaked appearance to the leaves. A deep brick red well describes the autumn tint of the foliage of *Marie Benoist*, while *Williams' Bon Chrétien* has

a very dark appearance, somewhat similar to *Fondante d'Automne*. Other varieties with characteristic foliage are *Souvenir du Congrès*, *Duchesse d'Angoulême*, *Beurré d'Amanlis*, *Marie Louise*, &c. It will be observed that most of the above-mentioned *Pears* are well known as varieties producing some of our best dessert fruits; thus by planting them in our shrubberies and garden borders we should not only be able to derive pleasure from their beautiful flowers and leaves in spring and autumn, but also to enjoy their produce, equally with those from the fruit garden. *H. H. T.*

SPRAYING-SYRINGES.—I do not know the *Ver-moré* syringe, but I do know the *Abol* syringe, sold by Messrs. White & Co., of Paddockwood, having one for use, and of that I can write in warm praise. It is small, neat, handled even easily by women, works freely, and because fitted with a patent arrangement has no back discharge, which is so great a nuisance in many syringes. This syringe is filled with both straight and curved nozzles, and it is the latter especially which makes the instrument so useful; and through its aid plants of all descriptions can be sprayed from the ground upwards on the undersides of the leaves, whilst the sharper the syringe is driven the more vaporous is the liquid emitted. Literally the moisture from it falls on plants like dew. Though sent out for special use with the popular *Abol* insecticide, it can be used equally with any other liquid. With all these syringes it is well to give them a turn with clear water occasionally to help keep them clean. *A. D.*

PROTECTING PEACH-TREES WHEN IN BLOOM.—While touching upon an old subject, the reading of which may prove of use to younger members of the craft, it cannot but afford interest to older practitioners, protecting the bloom of the *Peach* from the effects of spring frosts. I will briefly describe the method practised here, with the best results: during the winter months, or not later than the first week in January, all the nails and shreds holding the young wood of the previous season's growth close to the wall are withdrawn, only those holding the main branches in position are left. The object in so doing is to allow the flower-producing wood to stand out from the wall, thereby retarding the flowering period by several weeks, and mitigating the exciting influence of the sun shining directly upon the wall, as it usually does in the early days of the year. The trees naturally profit by the rest they have had, and quickly respond to a little warmth, only to receive a check from frost. The pruning is taken in hand at the present time, leaving only the task of nailing or tying when the flowers are expanding freely. The work is completed quickly, and as a finish, a single fish-net is fastened to the top of the wall, hanging down to the ground—not that I think it affords much protection, but it gives one the impression that the bloom is safe and the trees protected, and all we can do has been done. This method has been adopted here, after trying various others without success, and now I favour it more for the reason that last year complaints were heard on every hand of light crops or none at all. Severe thinning of the fruits had to be done last season to prevent injury to the trees. The *Peach*-wall has a south-east aspect, and the varieties grown are *Alexander*, *Early Louise*, and *Waterloo*. *W. H. Sharpe, Highwood Gardens, Rochampton.*

APPLE HOARY MORNING.—Among the showy section of dessert or cooking Apples this certainly has a claim to notice. Although having an ample supply of such sterling dessert varieties as *Cox's*, *King's*, *Ribstone*, *Adams' Pearmain*, and others, *Hoary Morning* is inquired for more frequently than any by visitors, because of its fine colour and bloom. The bloom which covers the surface of the fruit is as dense almost as that of the *Grape*, and as easily destroyed by handling. Full-sized fruits are too large for the dessert-table, but the medium-sized samples afford a touch of colour unpossessed by any other winter fruit. Quality, as previously intimated, is not present, sufficient to call forth favourable comment, but this is overshadowed by external beauty. The flesh, as with other deeply-coloured Apples, is suffused by a very pretty pinkish shade. Young trees on the *Paradise*-stock give the best fruits. *W. S.* [Flavour is the essential quality of all table-fruits. *Ed.*]

THE QUINCE IN SUSSEX.—In the *Gardeners' Chronicle* for January 27, 1900, p. 50, it is stated

that the Quince is largely grown in Sussex, and that "the fruit nowhere else attains so large a size, or so rich a flavour and hue;" but it does not appear that any special industry is carried on in Sussex with the Quince. It is capable of being made into a very choice kind of confectionery. In Italy they make what they call *cognata*, a sort of Quince-cheese. It has the same relation to Quince-jelly that Guava-cheese holds to Guava-jelly. The *cognata* is a softish solid, well sugared, and made into slabs of about 18 inches long, 12 inches broad, and 2 inches thick. Purchasers have a slice cut, and pay for it by weight. I know of no fruit conserve of a choicer flavour than this *cognata*. Under the teeth, it feels like crystallised Apricots, but with a wholly different flavour. Why should not an industry be set up in Sussex, where the Quince is said to grow so well, for producing this delightful *cognata*? The best way to learn how to make it is for some one to go to Florence and learn how it is made by seeing it made; or better to bring over a maker of *cognata* from Italy, and start the concern in Sussex. It is a conserve that everybody would purchase, and everybody would enjoy. *E. Bonavia, M.D., January 31, 1900.*

COLD WATER V. WARM WATER FOR PLANTS.—

On p. 80 of your last issue I read with interest the extract from *American Gardening* on this subject. A perusal of the extract should cause gentlemen's gardeners to discontinue the old practice of employing warm water for fruit-tree borders under glass. There are scores of head gardeners who still regard the use of warm water as being essential, and the extra labour that this entails acts injuriously on other departments of a garden. Mr. McIndoe, gardener at Hutton Hall, Guisborough, grows the finest of fruits, and gets them in very early; and he never uses warm water at any stage of growth. *H. Harris, Coedriglan Park Gardens, Cardiff.*

SCHEDULES.—Having been a member of committees of horticultural societies in Bucks, Kent, and Lincolnshire, and being a young exhibitor, I am particularly interested in your article on "Schedules" on p. 24 I have found that in neither society has any definite rule been followed in the wording of classes. I do not think that many will dispute your assertion that there is a general laxity and unintentional carelessness in this. For instance, this is from a schedule of a certain society:—"Class 40, collection of fruit, six kinds, Pines excluded." The winning exhibit last year included, 1, Black Grapes; 2, White Grapes; 3, Peaches; 4, Nectarines; 5, Figs; and I think the sixth was a Melon. If Black and White Grapes are allowed to count as one each, might not scarlet and green-fleshed Melons be exhibited on the same principle? Could there have been a successful protest according to the wording of the schedule? [The directions might read thus: Class 40, collection of fruit, six varieties. If it is intended on a future occasion to admit Black and White Grapes, the fact should be stated, and so with red or green-fleshed Melons. If no restriction is made in the schedule, black and white Grapes, scarlet and green-fleshed Melons, Red and White Currants might be shown, but the judges would naturally, other things being equal, give the prize to the exhibit that showed the greatest amount of diversity. *ED.*] What do you suggest should be the wording, when it is intended to allow any nine of the following fruits to be exhibited in a class: Grapes, Peaches, Nectarines, Figs, Apricots, Melons, Plums, Cherries, Apples, Raspberries, Gooseberries, Red Currants, White Currants? [The schedule might read, "Any nine of the following fruits: Grapes (black or white, or black and white, according to the desire of the committee, each variety counting as one unless otherwise specified), Peaches, Nectarines, Figs, Apricots, Melons, Plums, Cherries, Apples, Raspberries, Gooseberries, Red Currants, White Currants. Any of these may be selected to form a collection of nine varieties." *ED.*] Also, what should be the wording if two varieties of any of the above fruits are to be allowed? [If two varieties of Grapes, or Peaches, or what not are to be allowed, it is simply necessary to state the fact in the schedule, so that there may be no mistake. *ED.*] Also any nine of the following vegetables: Cauliflower, Cabbage, Brussels Sprouts, Savoy, Onions, Beetroot, Celery, Potatoes, Parsnips, Turnips, Carrots, Leeks, Artichokes, Marrows? [Collection of nine vegetables, selection to be made from the following varieties and species: Cauliflower, Cabbage, Brussels Sprouts, Savoy, Onions, Beet,

Celery, Potatoes, Parsnips, Turnips, Carrots, Leeks, Artichokes, Vegetable-Marrows; or, if it be desired to include one variety of the Cabbage genus only, then say selection to be made from the following varieties, but only one variety of the Cabbage genus to be shown. *ED.*] Also bunches of any twelve of the following flowers: Roses, Carnations, Sweet Peas, Phlox, Mignonette, Stocks, Asters, Dahlias, Lilies, Stephanotis, Lapagerias, Begonias, Montbretias, Helianthus, Allamanda, Eucharis. [Twelve flowers, selection to be made from the following: Roses, Carnations, Sweet Peas, Phlox, Mignonette, Stocks, Asters, Dahlias, Lilies, Stephanotis, Lapagerias, Begonias, Montbretia, Helianthus, Eucharis. Only one variety of each species to be shown (or more if preferred, but in that case specify the number that may be shown). *ED.*] The schedule asks for a collection of out flowers in twelve varieties. Is this sufficient information? [The expression "Cut flowers, twelve varieties," without any further specification, might lead to great trouble and difference of opinion, as one man might show twelve Sweet Peas, another twelve Carnations, and so on. The committee probably intended to ask for twelve species, one variety of each species. *ED.*] *T. H., Lincoln.*

THE CRYSTAL PALACE FRUIT SHOW.—One of the unfortunate results of the enormous cost of land in London is, that with the exception of the somewhat far-distant Crystal Palace, there seems to be no building in the metropolis which could fitly shelter the Royal Horticultural Society's fruit show. That the show, one of the finest displays of hardy fruit to be seen in Europe, is relatively so poorly attended at the Palace is a matter to be greatly deplored, but evidently it is chiefly due to the distance of the Palace from London, and to the time and trouble, as well as cost, expended in getting there and back. Doubtless, it is due to this lack of attendance on the part of the public which has led the Palace directors to intimate their intention to reduce the grant to the show by £50. But the directors, all the same, furnish a good deal free in the matter of space, tabling, labour, office, and printing and advertising, all representative of considerable cost. Probably no other place could furnish such advantages in these respects as the Crystal Palace does. The Royal Horticultural Society's Council, in their annual report, state that the fruit show therein involves great expenditure, without any financial return. If that be so, then it is difficult to understand why in the balance-sheet for last year's expenditure and income the cost of the show is put at £302 1s. 5d., and the income from the show as £326 12s. 8d. Is (in connection with this show) any credit given for the free admissions to the Palace for three days of the Society's thousands of Fellows? But it is not possible to feel other than sympathy with the Council's earnest desire to maintain the show, and to warmly support its plea for a subscription from the Fellows and others of not less than a sum of £150 to enable the show to be held this year. Cannot some features other than ordinary ones be introduced to help arouse public interest? Can no great personage, who would help to "draw," be invited to come and open the show? Cannot some meetings, attractive to all interested in fruit-culture, be organised? The Palace directors help on the first day with fireworks! Cannot the Royal Horticultural Council organise some sort of horticultural fireworks for the other days? *A. D.*

SALE OF HORTICULTURAL POISONS.—"A. D.," in the last issue of the *Gardeners' Chronicle*, p. 76, properly states the case of the sale of horticultural poisons, and it is quite evident we require a new enactment on this matter. Before the present Pharmacy Act was passed, poisons were carelessly dispensed, and danger was thereby incurred to the public. And it was entirely in the interest of the public that the present Pharmacy Act was passed, by which certain poisons scheduled in the Act can only be sold by certificated chemists. The chief danger to the public consisted in unqualified persons keeping these poisons in bulk and selling them in small quantities. At the time of the passing of the Act, also weed-killers and many of the fumigants in their present form were not known. The sale of weed-killers and fumigants is now an important item in a seedsman's business, and chemists have allowed that business to grow to its present dimensions. They now interfere on what they term public interest. But they have not proved that there has been any danger to the

public in seedsmen selling poisons for garden use; neither have they proved that the public would have any extra security were these poisons to be bought from chemists only. Horticultural poisons are made up in sealed packages, and it little matters whether these packages cross a seedsman's or a chemist's counter—the danger to the public is when they are afterwards opened, and carelessly kept about a place. There would be a real danger if seedsmen kept these horticultural poisons loose as they keep Onion-seed, and sold them to anybody in small quantities. But they are kept only in the packages, as they are sent out by the manufacturing chemists, and as a matter of fact, which every seedsman can speak to, these poisons are only asked for by gardeners or other persons qualified to use them. The whole question of the sale of poisons ought to form the subject of Parliamentary enquiry, when I am sure seedsmen could present a strong case. *Robert Marfee, Paisley.*

CHRYSANTHEMUMS IN FEBRUARY.—Among the latest flowering varieties is Maud Dean; the plant is of good habit, and the flowers are pale pink in colour, fading to white. With me it blooms later than L. Canning, Princess Victoria, or W. H. Lincoln, as cut backs. I enclose a few specimens, and have still scores of blooms not yet fully expanded. *M. Jones, Undermount gardens, Bonchurch, Isle of Wight.* [The variety is certainly useful for late flowering. *ED.*]

THE WEATHER AT BIFRONS PARK, KENT, DURING JANUARY LAST.—Rainfall for the month, 2.70 inches; the heaviest fall being that of the 29th–30th, viz., .98 inch. The minimum shade temperature occurred on the 21st, when 11° of frost were registered. The maximum reading for the month was 52° F., on the 23rd. The month generally was damp and sunless, more especially during the last week. *F. J. S., Bifrons Park gardens, Canterbury.*

THE WEATHER IN SOUTH BUCKINGHAMSHIRE.—After experiencing comparatively mild weather for about a month, a heavy snowfall occurred in this part on the night of February 2-3, such as has not occurred for several years. The fall, accompanied by a strong wind from the north-east, drifted in many places to a depth of 5 and 6 feet, causing much inconvenience, and the blocking up of some of the country lanes. The average depth of the snow in the open country was 9 inches. The thermometer since the snowfall has kept within a degree or two of the freezing-point, with a slight thaw. With an overcast sky and a falling barometer a further downfall seems probable. *C. Herrin, Bourne End, February 5.*

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 1.—On this occasion, J. LEE-MANN, Esq., West Bank, Heaton Mersey (gr., Mr. Edge), staged a handsome collection of plants, amongst which were several of real merit; the finest being a plant of *Dendrobium nobile virginalis*, flowering from what appeared to be an 1898 pseudobulb. This lovely variety of *D. nobile* requires no description beyond saying that it is a pure albino form of a very common and beautiful *Dendrobium*. The Committee unanimously awarded it a First-class Certificate.

Cattleya Trianae var. *picurata* received an Award of Merit. This variety is in the way of C. T. Backhouseana, but the splashing in the centre of the petals is not so marked as in that variety; the form of the flower is very fine.

From the same collection came a distinct hybrid *Cypripedium*, which might have been the result of crossing C. Rothschildianum with C. Curtisii. The blossom is of an intense claret colour, and presents the general formation of C. Rothschildianum, except in the drooping of the petals. The latter have peculiar rose-tinted points, as seen also in those of C. Curtisii. Another good *Cypripedium* hybrid was C. *Leeanum giganteum* × C. *Bruno*, the latter parent being a cross between C. *Spicerianum* × C. *Leeanum*. When dissected, the parentage of this hybrid is seen to be very mixed, but the result is satisfactory (An Award of Merit). A Silver Gilt Medal was awarded to Mr. LEE-MANN's group.

W. DUCKWORTH, Esq., Shaw Hall, Flinton (gr., Mr. Tindall) exhibited the pretty *Dendrobium* × *Curtisii* (D. × *Cassiope* × *pureum*). A small plant with flowers having pure white segments, and dark-coloured marking on the labellum (Award of Merit).

T. BAXTER, Esq., Morecambe (gr., Mr. Roberts), gained a Cultural Certificate for a flowered specimen of *Dendrobium* ×

Cassiope; and the same exhibitor sent a batch of well-grown and well-flowered *Odontoglossums*.

Mr. Gratrix, West Point, Whalley Range (gr., Mr. McLeod), sent *Cypripedium* × *Leucanum* var. *Clinkaberryanum*; a very fine form of this pretty hybrid receiving an Award of Merit. From the same gardens came *Cypripedium* × *Thompsoni*, which received a First-class Certificate a year ago; an Award that was confirmed on this occasion.

Mr. J. Cypher, nurseryman, Cheltenham, exhibited *Cypripedium Wootoni*, supposed to be the result of crossing *C. barbatum* × *C. bellatulum* (Award of Merit). He likewise showed *Dendrobium* × *Ethel* (*D. japonicum* × *D. Rolfe* var. *roseum* (Award of Merit).

Mr. J. Robson, Altrincham, sent a fine form of *Cypripedium* insigne named *Dormani*, which, however, was not fully developed; and the Committee wished to see it at the next meeting.

Mr. R. Eichler, Exotic Nursery, Bingley, exhibited three *Cypripediums*, viz., *C. × Henry Graves*, *C. Veitohi*, "*Demidoff's* var.," and *C. insigne*, var. *Ernesti*. P. H.

THE ROYAL SCOTTISH ARBORICULTURAL.

ANNUAL GENERAL MEETING.

THE forty-seventh annual general meeting of this Society was held at No. 5, St. Andrew Square, Edinburgh, on Wednesday, January 31, 1900, at 2 P.M., the Right Hon. the Earl of Mansfield (Scone Palace), President, in the Chair. The Committee met at 1.30 P.M. for the routine business, reading the minutes, and hearing reports of the Council, secretary, auditor, and treasurer.

Though the death-roll of the Society had been heavy, and included such notable members as the Marquis of Lothian, Messrs. Welsh, Dunn, and others, yet many members had joined, the membership having increased from 802 to 834.

Mr. John Methven, in asking for the adoption of the report, moved a hearty vote of sympathy and appreciation with the Marchioness of Lothian and family. The Marquis was President of the Society from 1879 to 1881. This Society has a substantial balance on the credit side of its capital, and revenue-side of the account. The entire routine business, as the selection of officers—President, Vice-President, Secretary, Treasurer, &c.—was speedily carried through.

A proposal, however, by Mr. G. Fraser of Dalzell, to allow members to vote by proxy at all general meetings, was defeated by 28 votes to 6.

Mr. Laird also reported that it was found impossible to have their excursion to France this year as proposed. It also seems that the promised Forestry Exhibition in Glasgow next year (1901) would not be held.

At the close of the routine business, three excellent papers were read. The last is placed first, because it was the more brief and original. The subject was the afforestation of waste lands in this country (about 15,000,000 acres), and his leading idea was that some of the spare time of our soldiers might be employed in the work. He was understood to say that each soldier might perhaps manage some ten acres of forest land. This might be a means of drawing soldiers from the rural districts rather than crowded towns, as well as improve the morale and physique of the army.

The address given by the Earl of Mansfield, advocated the teaching and training and lodging of young foresters on the same lines as had proved so successful in the raising of Scottish gardeners. A three years' apprenticeship; the bothy or lodge system with its social and educational advantages; and terms of journeymanhood on the same or other estates should follow.

The lads for the first year should be employed in the home nursery so as to become familiar with the kinds of trees; their propagation and general treatment. The second year they should have instruction in the formation and management of plantations, including fencing, hedging, rough carpentry, and perhaps road making and bridging. The third year something of the following might be included in the course, viz., the marketing of timber, valuing of standing and felled timber, and the working and management of saw mills. Some training in farm work should also be afforded. This society could also establish a registry of employment for foresters; and it needs dinning into the public mind that foresters were members of an independent profession, and not merely cutters of wood and diggers of drains.

Some humorous observations were made by Mr. J. C. Mackenzie, M.P., on the relations between the forester and the game-keeper. A hearty vote of thanks was passed to Lord Mansfield for his address.

Mr. Nisbet then read an instructive paper on "The present Condition and future Prospects of Forestry in Great Britain." He complimented the Scottish Arboricultural Society on the good work it had done in advocating better methods and schools of forestry; £18,000,000 worth of Coniferous timber, used yearly in these islands, might be grown at home.

Our chief sources of supply were Canada and the Baltic, both in danger of being soon exhausted, through the growing demands of Germany and the United States of America. As to the present condition of British forests, the largest areas of them are pleasure-grounds and game-coverts, suffering from dense planting alternating with excessive thinning.

Woods must be managed on correct plans before they would yield good returns; more thorough and perfect instruction was also needed; Government might advance money, at easy rates of interest; and the injurious rating of woodlands should cease. Something must be done to avert a timber

famine, which threatens to prove far more severe and disastrous than a Cotton famine.

In the evening the members of the Society dined together, with the Earl of Mansfield, at the North British Hotel.

After the usual loyal toasts, that of the Society was proposed by Mr. James Macdonald, the Secretary of the Highland and Agricultural Society, who spoke mainly on the close relationship of forestry with agriculture, and of his belief that the country would greatly benefit if more attention was paid to forestry.

The Chairman, in responding, said he found great ignorance of, and much praise for the Society abroad. He wished such people would mend their manners and become members; admiration at a distance being all very well, but they would rather have it a little closer.

Mr. John Macmillan, the Master of the Merchant Company, proposed the toast Forestry Instruction. He dwelt strongly on the vital importance of the subject; mentioning among other things that the percentage of the acreage under forests was smaller here than in any country in Europe, not excepting Holland and Denmark. The small state of Belgium, with the densest population in Europe, had forests nearly five times greater in extent than this country.

Dr. Nesbit in reply referred to what had been done by the Indian Government, and remarked incidentally that the failure of crops, and the consequent famine in that country, was to a certain extent due to the devastation and clearance of natural forests to an extent almost beyond the power of man to replace. He concluded by advocating the institution of a Chair of Forestry in this country, and appealed to the Merchant Company to assist in this direction.

The meeting concluded with the health of the Chairman being felicitously proposed by Professor Bayley Balfour, of the Royal Botanic Gardens, which was duly honoured.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 5.—The annual general meeting of the members of the National Chrysanthemum Society was held on Monday evening last, at Carr's Restaurant, Strand. The chair was taken by Mr. Percy Waterer (Chairman of the Executive Committee), and there was a good attendance.

The notice convening the meeting, and the report of the Executive Committee, both of which had been previously circulated, sufficiently indicated that there were contentious matters to be raised, that would make the proceedings lively. These meetings of the National Chrysanthemum Society differ considerably from those of other horticultural societies. The proceedings are certainly not "cut and dried," the members do not leave every particle of business to be settled for them by their Committee, and if there is too much evidence of a combative feeling amongst them, they are at least exempt from the charge that they lack interest or earnestness.

REPORT OF EXECUTIVE COMMITTEE.

This report, which was taken as read, described the affairs of the Society as "of a generally satisfactory character." The exhibitions held during last year were considered to be specially remarkable for the "singularly fine blooms of the Japanese type," and expression was given to the general opinion that incurred blooms were "scarcely so numerous and refined as in previous years." With regret the committee has noted "that the incurred, the reflexed, and the Anemone-flowered types appear on the exhibition stages in decreased numbers." It may be hoped that measures will be taken to give increased encouragement to growers of these sections. The Vase class the committee refer to with satisfaction, and acknowledgment is made of the Society's indebtedness to Sir Ed. Saunders and other donors of special prizes. A sub-committee was appointed to take into consideration the relations existing between the parent society and those affiliated with itself, and has recommended that amendments be made in certain privileges the affiliated societies are given. These recommendations were adopted by the Executive Committee, and certain alterations being necessary in the rules, these were submitted to the annual meeting for adoption. The result will be seen below.

THE BALANCE SHEET

showed that the receipts from annual subscriptions amounted to £266 13s. 6d.; foreign members' subscriptions, £8 2s. 4d.; from Royal Aquarium Company, £375; Affiliated Societies' Medals, &c., £64 6s.; donations and special prizes, £151 6s. Altogether the receipts were £1099 0s. 5d. On the expenditure side a sum of £568 13s. was given in prizes; £142 5s. 3d. was paid for medals; £69 19s. 6d. for printing and stationery, &c.; there is a balance at the bank of £76 4s. 6d., and the Committee recommended that the sum of £50 of the reserve fund now on deposit be increased to £100.

The Chairman in proposing the adoption of the report and balance sheet, remarked that he was of opinion that incurred blooms would be better shown at the November exhibition were the date a little later. More encouragement should be given to exhibitors of flowers of this type at the December exhibition. The report should have contained an appreciative reference to the kindness of Lord Rosebery in permitting the society to visit Mentmore in the summer. The charge of £12 9s. 9d. for expenses at the annual dinner should not appear in the accounts. The dinner should be arranged on a business principle, and pay for itself. The Chairman's motion having been seconded by Mr. G. Langdon, references to the dinner item were made by Mr. Simpson and Mr. Newell from different standpoints, and eventually an explanation of the expenses incurred was given by the secretary, which put rather a different light upon matters.

Mr. J. W. Moorman was pleased with the statement of accounts. Two years ago the society had to trespass upon the reserve fund to the extent of nearly £50, and it was now to be paid back. The society was pursuing the right course. The Chairman's motion was then carried unanimously.

ELECTION OF OFFICERS.

Sir Edwin Saunders was re-elected President of the Society by acclamation. Mr. Percy Waterer was re-elected Chairman of the Executive Committee, and Mr. Bevan Vice-chairman. Mr. Wilkins and Mr. Harman Payne were also elected to retain their positions as Treasurer and Hon. Foreign Secretary.

Then the appointment of a General Secretary became necessary, and the meeting approached the question somewhat nervously, anticipating a warm debate.

The re-election of Mr. R. Dean having been proposed by the Chairman, and seconded by Mr. Ballantyne, in short speeches, that showed how much they appreciated the work done in the past by the present Secretary, Mr. Thos. Bevan rose to propose his motion, of which notice had been duly given, to the effect that the election of a secretary be postponed until the Society had advertised, for a properly qualified person to fill the post at a salary of £100 per annum.

Mr. Bevan proceeded to review certain circumstances connected with the fulfilment of the duties of Secretary by Mr. Dean, and to complain of his conduct in several important respects. One ground of complaint was that he had written last year in *American Gardening* an article that appeared to make the most of the financial difficulties that had overtaken a very few Chrysanthemum societies in England, and in other respects to encourage an idea that was prevalent in America that the prestige of the Chrysanthemum as an exhibition flower and of the National Society in England had decreased. Mr. Dean's attitude in regard to the "Stredwick" case, for which the sum of £5 18s. 7d. appears in the expenditure-account, was severely criticised. Amongst other charges brought by Mr. Bevan was that the present Secretary assumes towards the Society's committees and officers an attitude of dictatorship, that makes it very difficult for the officers to continue to work with him. There were other complaints, some of them advanced with considerable warmth, but through all it could be plainly seen that the attitude taken by Mr. Bevan was an honest attitude, and he was generally believed when he declared that he would sooner have forfeited £10, than have felt it his duty to make the speech he had delivered.

But the meeting had already made up its mind that no better secretary could be obtained than Mr. Dean, and especially after his reply to Mr. Bevan had been made, his re-election became a certainty. When therefore, the motion by Mr. Bevan had been seconded by Mr. W. Wells, and remarks had been made upon the subject by a few members, there voted in favour of deferring the election of secretary three members only, and when the chairman's proposal was again placed before the meeting, Mr. Dean was re-elected unanimously, amidst much applause. Mr. Dean returned thanks, and said that though seventy years of age on the 1st of the present month, his energy and his enthusiasm in the work of the National Chrysanthemum Society, were equal to that of any one present of thirty years of age.

Then was announced the result of the election of members to the Committee, nominations for which had been made earlier. Including those members retiring and seeking re-election, there were fifteen vacancies to be filled. The following gentlemen were elected, and the positions are those obtained in the poll: J. H. Witty, J. W. Moorman, D. Ingamelle, J. Lyne, A. Newell, W. A. Sturrock, Cuthbert, J. R. Cholmeley, W. A. Holmes, R. E. Reeve, Swales, J. Brooke, A. J. Foster, E. Dove. Another gentleman elected has since refused the position.

AMENDMENTS TO RULES.

Rule X.—The recommendation of the Executive Committee was to delete Privilege I., and substitute other words which would make it necessary that all delegates from affiliated societies, to the parent society, should become members of the National Chrysanthemum Society. Also to limit their powers of voting, to matters affecting affiliated societies only.

A very animated discussion arose upon this recommendation, and delegates from affiliated societies rose one after another, protesting against the proposed alteration, and declaring that if it were persisted in, affiliated Societies would withdraw in large numbers. Mr. Staten, a representative from the Nottingham Society, vigorously denounced the proposal, and supported an amendment by Mr. Moorman. Upon putting the question to the vote, it was seen that the committee's proposal was lost, and the sense of the paragraph they had drawn up was modified until it read:—

"To appoint one of its *bona-fide* subscribers as a delegate to the Executive Committee of the National Chrysanthemum Society, with power to speak and vote on any subject except finance."

The following new privileges were then added without opposition:—

2.—"That such Delegate be annually elected by the Society appointing him at a properly constituted meeting of such Society."

3.—"That a copy of the resolution appointing such Delegate be sent to the Secretary of the National Chrysanthemum Society, with an intimation to the effect that the appointment was made in due order."

Condition 1 of Rule X. was rescinded, and the following substituted:—

"That with the one special exception hereafter mentioned, the Society's Medals and Certificates be awarded only to classes for Plants or Cut Blooms of Chrysanthemums, and

that all inscriptions be recorded thereon before being handed to the winners; but Affiliated Societies obtaining the Medals of the Society are permitted to purchase one extra Medal, which may be awarded to non-competitive exhibits of any kind at their exhibitions, at the discretion of the judges.

It was further resolved that all alterations in the Rules rendered necessary by the above resolutions be carried out.

The business of the evening was thus concluded, after having lasted close upon four hours.

MISCELLANEOUS.

Iale of Wight.—On Thursday last a public meeting was held in the Newport Guildhall, with the object of forming a local Chrysanthemum Society. Mr. W. Morris presided over an attendance which was small, largely due to the inclemency of the weather. It was resolved, on the motion of Mr. W. E. Wickens, that a Newport Chrysanthemum Society be formed, and that an exhibition be held in November next. A local committee was elected, with P. T. Mew, Esq., J.P., C.C., President; Dr. M. L. Coombes, Treasurer; and Mr. C. H. Cave, Honorary Secretary.

Iale of Wight Horticultural.—On Saturday, February 3, this Association held their adjourned annual meeting at Warburton's Hotel, Newport. Dr. J. Groves, B.A., J.P., presided over a good attendance of members. It was resolved to elect local committees at Cowes, Ryde, Shanklin, Ventnor, Freshwater, and Newport, with seven members each; and it was decided to amalgamate with the Ryde Horticultural Society in the holding of an exhibition of spring flowers in April next. It was resolved to hold an exhibition of fruit and honey at Newport in October. It was decided to award the Association Certificates to meritorious exhibits staged at any of the Island shows during the year 1900. The programme of lectures and places of meeting for the current year was left in the hands of the Secretary. A sub-committee was appointed to make arrangements for issuing an Association almanac in book form, to contain the papers read at the meeting, and other information. A lengthy meeting was brought to a close by the election of seven new members. S. H.

Devon and Exeter Gardeners.—At a recent meeting of the members of this association, a paper upon "Gardening as a Profession," was read by Mr. G. CAMP, gr. to Mr. E. BYROM, Culver. The essayist said that the professional gardener is underpaid. Like other callings, that of gardening is subject to the law of supply and demand; there is now an excess of supply over demand. The system of apprenticeship should be more strictly adhered to, and means taken to prevent the profession from being overcrowded by half-qualified men, who originally were admitted to gardens as "helpers." The good work that is being done by the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund was referred to appreciatively by Mr. CAMP, and by several of those who subsequently engaged in what proved to be an animated discussion.

The Pomological, Boskoop, Holland.—The following were awarded Certificates—*First Class*: to *Ploea excelsa aurea* magnifica, imported by Messrs. Ottolander & Hooftman, Boskoop; to *Azalea Yodogama*, imported by Messrs. M. Koster & Sons, Boskoop; to *Azalea "Peter van Noordt"*, raised from seed by Messrs. P. van Noordt & Sons, Boskoop; to *Hemerocallis aurantiaca* major; to *Spiraea Aruncus* Kneiff; to *Sambucus pubens maxima*, all of which were imported by Mr. K. Wezenburg (C. de Vos), Hazerswoude, Holland. *Second Class*: to *Chamecypris Lawsoni* and erecta var. *filiformis*, imported by Messrs. Ottolander & Hooftman, Boskoop; to *Gaultheria procera*, imported by Messrs. G. Y. Alberts & Co., Boskoop; to *Spiraea callosa* Froebel foliis variegata; to *Polygonum Baldschuanicum*, both imported by Mr. V. Wezenburg (C. de Vos), Hazerswoude; to the Apple "Van der Stam's Orange Reinette," raised from seed by Mr. G. Van der Stam, Boskoop; to the Apple "Queen Wilhelmina," raised from seed by Mr. P. van Fol, Boskoop. *First Class*: to the Black Currant "Goliath," raised from seed by Messrs. J. Boer Wz & Sons, Boskoop. P. A. Ottolander, Chief Secretary of the Pomological Society, Boskoop.

Chester Paxton.—Owing to the death of the Duke of Westminster, K.G., the annual social gathering of the members of this Society was postponed until last Saturday evening, when about 150 members met at the Grosvenor Museum, under the presidency of Mr. Robert Wakefield. After tea had been partaken of in the Art Gallery, a capital concert was provided in the Lecture Theatre. Mr. Siddall gave a brief account of the war, his lucid descriptions of many of the chief places of interest in South Africa being illustrated by lantern-slides. The musical programme included several patriotic songs, including "Soldiers of the Queen" and "The Absent-Minded Beggar," and a substantial sum was collected for the war fund. Mr. N. F. Barnes proposed, Mr. John Wynne seconded, on behalf of the Society, a vote of thanks to all those who had contributed to the evening's enjoyment, which was cordially responded to; as also a similar compliment to the President, proposed by Mr. Miln.

Hornsey and District Chrysanthemum.—The annual meeting was held on the 31st ult., and the report and balance sheet were adopted with much satisfaction. A balance during the year was acquired of £8 6s. 11d. The late Secretary, Mr. T. A. Newman, who has been obliged to resign the position owing to a change of locality, was presented with a marble timepiece and an address, as a mark of appreciation upon the part of the members for the services rendered by Mr. Newman. The new Secretary is Mr. T. W. Lester, 17, Fairfax Road, Hornsey.

Obituary.

JAMES PALLETT.—We regret to announce the death, on Monday last, of Mr. J. Pallett, the Superintendent of Waterlow Park, Highgate. Deceased was out in the park during the morning, and appeared then to be in his usual state of health. When at mid-day he reached the lodge in which he lived, he remarked to his wife that he felt faint, and at once sat down in an armchair, and expired before any assistance could be rendered to him.

GEORGE BROWN.—By the death on Jan. 24, at the age of 93, of Mr. George Brown, we lose a very capable representative of the old type of Scotch gardeners. He was a native of Aberdeenshire, and acquired his earliest knowledge of gardening in Scotland. In the early thirties he came to London, finding employment in Messrs. Henderson's Pine-apple Nurseries. For ten years he occupied a situation as gardener in Leicestershire, and had for a near neighbour the late Peter Greive, gardener at Culford Hall. Mr. Brown went to Sandford Priory in July, 1848, as gardener to the then owner, Mr. Chateris. At this time the pleasure grounds there were very limited, and so began what was the crowning effort of his life. He had no sooner become settled in his new home than he began hybridising the then very limited collection of Rhododendrons contained in one bed, and so successful was he that several of our very best varieties owe their origin to his efforts. Space had to be made for many of his favourite varieties, and eventually many acres were planted with Rhododendrons, and hardy Azaleas, which latter he crossed with excellent results. Notwithstanding the work of raising new varieties of Rhododendrons and Azaleas which occupied much of his attention, he was a good all-round gardener. The deceased retired from his charge five years ago, whilst still hale and hearty, the gardens and estate having been taken over by various tenants. Charles Dalby, Greenham Lodge Gardens, Newbury, Berks.

Remarks.—The weather during the week has been remarkable for cold, north-easterly winds. Sleet and rain fell on Friday, followed in the evening by snow to the depth of 3½ inches.

GENERAL OBSERVATIONS.

The following summary record of the weather throughout the British Islands, for the week ending February 3, is furnished from the Meteorological Office:—

"The weather during this period varied greatly in different parts of the kingdom. Over all the eastern and south-eastern districts it was very gloomy, with frequent falls of snow, sleet or cold rain, the fall of snow or sleet on Friday night being very heavy over our south-eastern counties. Over Ireland and the extreme western and northern parts of Great Britain,

however, the conditions were generally fair, and the falls of sleet or rain were slight and infrequent.

"The temperature was below the mean, the deficit ranging from 2° in the 'Channel Islands,' and 3° over the eastern and north-eastern parts of Great Britain, to 5° in the 'Midland Counties' and 'England, S.W.,' and to 6° in 'Scotland, W.' and 'Ireland, S.' The highest of the maxima were registered during the earlier half of the period, and ranged from 48° in 'Ireland, S.,' and the 'Channel Islands,' to 41° in 'England, E.,' the 'Midland Counties,' and 'Scotland, W.' The lowest of the minima were recorded either at the commencement or end of the period, and ranged from 14° in 'England, N.W.' (at Newton Belguoy on Friday), and from 18° and 19° in 'Scotland, E. and N.,' to 28° in 'England, S.W.,' and to 36° in the 'Channel Islands.'

"The rainfall was more than the mean in 'England, N.E., E., and S.,' but less in all other parts of the kingdom.

"The bright sunshine exceeded the mean in 'Scotland, N. and W.,' and over Ireland, the excess in the latter country being very large. The percentage of the possible duration ranged from 5 in 'England, E.,' and 8 in the 'Midland Counties' and 'England, S.,' to 23 in 'Scotland, N.,' 37 in 'Ireland, N.,' and 45 in 'Ireland, S.'"

MARKETS.

COVENT GARDEN, FEBRUARY 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

SEEDS.

FEBRUARY 7, 1900.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with only a quiet business passing. The continued demand from Germany, for English Cloverseed, combined with the firm quotations cabled from America, inspire London holders with confidence meantime; there is no change this week in either Alsike, White, or Trefoll. As regards Timothy, the tendency is still upwards. Blue Peas, and Haricot Beans, owing to the wintry weather, meet an improved request, whilst there has been more doing both in Spring and Winter. Tares and Birdseeds move off slowly, on former terms; but Mustard and Rapeseed are held for higher rates. Linseed continues dear.

FRUIT AND VEGETABLES.

GLASGOW: February 7.—The following are the prices since our last:—Apples, Canadian; Baldwins, 19s. to 22s. per barrel; Northern, Spy, 18s. to 22s. do.; Greenings, 17s. to 18s. do.; American-California, Newtown Pippins, 9s. to 12s. per box; Grapes, English, 1s. to 2s. 6d. per lb.; do., foreign, Alameda, 12s. to 16s. per barrel; do., best, 30s. to 30s. do.; Bananas, extras, 9s. to 10s. per bunch; No. 1, 8s. to 9s. do.; No. 2, 6s. to 7s. do.; small, 5s. to 6s. do.; Oranges, Murcia, 7s. to 8s. per half case; Valencia, ordinary, 420's, 8s. 6d. to 9s. 6d. per box; large, 10s. to 10s. 6d. do.; extra large, 12s. to 14s. do.; Jumbos, 15s. to 16s. do.; large and extra large, 714's, 11s. to 13s. do.; Seville Bitter Oranges, 10s. per half chest; Palermo, do., 5s. to 6s. per box; Lemons, Palermo, 8s. to 10s. per case, and 4s. 6d. to 6s. per box; Mushrooms, 1s. to 1s. 2d. per pound; Onions, English, 5s. 6d. to 6s. 6d. per cwt.; do., Valencia, 5 in a row, 8s. per box; 4 in a row, 7s. do.; Tomatoes, Teneriffe, 3s. to 4s. per case; half case, 5s. to 6s.; Turnips, Swedes, 1s. 6d. to 1s. 8d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Cauliflowers, 1s. 9d. to 2s. 2d. per dozen; Cabbages, 8d. to 1s. 6d. do.; Celery, 8d. to 1s. 2d. do.

LIVERPOOL: February 7.—Wholesale Vegetable Market.—Potatoes, per cwt., Lynn Greys, 8s. to 9s. 6d.; Main Crop, 3s. 4d. to 4s. 6d.; Bruce, 3s. 4d. to 3s. 9d.; Champions, 3s. 4d. to 3s. 6d.; Turnips, Swede, 1s. to 1s. 8d. per cwt.; Carrots, 3s. 6d. to 4s. 3d. do.; Parsley, 6d. to 8d. per dozen bunches; Onions, foreign, 3s. 9d. to 4s. 6d. per cwt.; Cauliflowers, 1s. 9d. to 2s. 3d. per dozen; Cabbages, 8d. to 1s. do.; Celery, 6d. to 1s. 2d. do. St. John's.—Potatoes, 1s. per peck; do. new, 3d. per lb.; Grapes, English, 8s. do.; Pines, English, 4s. 6d. to 6s. each; Cobnuts, 1s. per lb.; Asparagus, 1s. per bundle; Cucumbers, 8d. to 1s. each; Mushrooms, 1s. 4d. per lb. and basket. Birkenhead.—Potatoes, 1s. to 1s. 3d. per peck; Cucumbers, 1s. each; Filberts, 10d. per lb.; Grapes, English, 1s. 6d. to 2s. do.; do., foreign, 4d. to 8d. do.; Pines, foreign, 4s. to 6s. each; Mushrooms, 1s. to 1s. 6d. per lb.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending February 3, and for the corresponding period of 1899, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Barley	27 2	25 4	— 1 10
Oats	17 0	16 6	— 0 6

ENQUIRY.

LAELIA ANCEPS CALVERTIANA AND ROSEA.—A correspondent would be pleased to hear if anyone has these varieties still alive. He would much like to see them, for so far as he is aware they are dead.

RATS.—To catch rats you must deceive them. Get an iron trap (gin) and adjust it so that a 2 oz. weight will spring it when placed on bridge. Next get a box large enough for trap to lie in, and about 4 inches or 5 inches deep. Now set the trap, and lay it carefully in the box, and cover it over with tissue-paper, and sprinkle a few bits of bread over it. The rat smells it, he finds it, and jumps on to the solid bottom (as he thinks), and is caught by the fore-legs. I have been quite successful that way. But, better still, keep all food out of their way, and as far as you can out of their smell, and do not drop or throw any food about. Food is what they come to seek. At my house we are very particular that way, and I have not heard or seen a rat, mouse, or beetle for a long time, and yet my neighbours are pestered with them. I have an earthen pan with cover for bread, and a hanging cupboard for other foods, and no rat or mouse can get in, and all crumbs are swept up. Starve them and set your dogs on them, and I think you will soon be free of them. W. M., in *English Mechanic*.

CATALOGUES RECEIVED.

GARDENING APPOINTMENTS.

MR. CYRIL ARCHER, for some years in the Gardens at Addington Park, Croydon, and Compton Wood, Eastbourne, as Head Gardener to His Grace the Archbishop of Canterbury, Lambeth Palace.
MR. DONALD LEITCH, for the past two years Foreman at Alloa House gardens, Alloa, N.B., as Head Gardener to Mrs. STIRLING, Kippenross, Dunblane, N.B., entering on his duties first week in March.

ANSWERS TO CORRESPONDENTS.

CORRECTION, p. 7.—For liquid air read hydrogen.

CYCLAMEN FLOWERS: A. L. The doubling of the flowers is frequent, and not uncommon, and in some instances the peculiarity is becoming fixed.

CYCLAMEN LEAVES DECAYING: O. H. V. The result of a check, or unsuitable methods of cultivation.

DAHLIA LITERATURE: B. C. R. We would refer you for a succinct history and descriptive notes of the plant to the *Dictionary of Gardening*, by G. Nicholson, published by Upcott Gill, 170, Strand, W.C.; and to the *Propagation and Improvement of Cultivated Plants*, by F. W. Burbidge, published by Blackwood & Sons—a work probably now out of print.

INSECTS: W. E. D. The curious excrescence on the Laurel branch is the cocoon containing a living chrysalis (pupa) of the Puss-moth (*Dicranura vinula*). Willows and Poplars are the food-plants of this beautiful insect; and the individual which has spun up its cocoon on your Laurel branch had probably fed on one or other of those trees in the immediate neighbourhood of your interesting find. R. N.

INSECTS: Foreman. We can find none. You should send such specimens in a small box or bottle rather than in an envelope.

IVY, WHEN TO CUT BACK THE SHOOTS AND FOLIAGE: Ivy. In order not to have the wall bare of greenery for a longer period than is necessary, wait till the first signs of growth are observed, then you may trim it in closely, and not have to wait more than a month for a fresh covering of leaves. The warmer aspect will show leaves first, and the east side may be a week or ten days behind it in point of time.

NAMES OF FRUITS: A. C. 1, Yellow Ingestre; 2, Pitmaston Nonpareil.—A. L. G. 1, Herefordshire Beefing; 2, Reinette Diel.—J. R. You have exceeded the number of specimens allowed by our regulations, three are therefore named this week, and the others will be dealt with in a future issue; 1, Cockle Pippin; 2, Calville Rouge d'Hiver; 3, Cobham.—C. W. S. The specimen is not recognised, but it is reserved for further examination and comparison, and a reply will be given next week.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. B. G., Stafford. A very finely coloured form of *Laelia anceps*. The other is a remarkably good variety of *Cattleya Walkeriana nobilior*, not *C. dolosa*.—E. J. L. 1, *Thunia orientalis*, var.; 2, *Thunia orientalis*, var.; 3, *Cupressus Lawsoniana*, var. *erecta viridis*; 4, *Cupressus thyoides*.—T. F., Magdeburg. The *Cattleya* belongs to the *C. Triani* alba section, usually known as *C. T. delicata*, but a remarkably pretty form of it.—A. B. *Calanthe vestita luteo-oculata*.

POTATOS: J. W. Y. We are unable to name varieties, as to do this the foliage, flowers, habit, &c., must be under observation, and necessarily at this date you are able to send only the tubers.

WEATHER: F. J. S. We are much obliged, but with a weather record from Chiswick, and that afforded by the Meteorological Office we are sufficiently well served. Instances of remarkable weather in any part are always acceptable.

THE ART AND SCIENCE OF STOKING.

A BELGIAN horticulturist, unacquainted with English methods of stoking, is desirous of information in regard to several matters connected with the heating of glasshouses. To horticulturists of all classes, and many inhabitants of the colder parts of the earth, this is a matter of much interest, and some importance; seeing that success in the culture of the occupants of glasshouses and pits, harbouring plants which require artificial heat, depends in a great measure, upon the manner in which the temperatures are maintained in the various structures. An ordinary boiler, longer than it is wide, should be set on a bed of brickwork, having a rise of at the least half an inch per foot run, from the front to the back, at which point the flow-pipe connecting with the main flow-pipes in the house or leading thereto, should be fixed, in order to accelerate the circulation of the water in the boiler and pipes. Attention to this important matter of a rise in the bedding and slope of the fire bars at the right time, is of the greatest importance to the satisfactory working of the heating apparatus as a whole. Thus it will be seen that a horizontal tubular, a Cornish cylinder, and any kind of saddle-boiler, say of nine feet in length, should have at the least a rise of four and a half inches from the furnace-door to the back, and six inches would not be too much. Another important point to be observed in the setting of such boilers, is not to allow too much

space between the top pipes or dome of boiler, and the fireproof tiles or brick arch covering the boiler; a clear space of not more than four inches being all that is needed. This will cause the flame to impinge on the top part of the boiler, causing the rapid warming of the water in the boiler. The damper for regulating the draught in the chimney, should be fixed immediately above the point where the flue enters the same. If the furnace-house be situated in the open, that is, distant from trees and buildings, the chimney-stack may be built from 12 to 15 feet high, in order to insure a good draught. A height of 12 feet will be sufficient where coke is burnt, but for the combustion of anthracite coal, the sharper draught afforded by a chimney higher than these figures is essential.

To begin at the beginning, the best way to light a fire in a garden furnace, where the necessary quantity of live coke or coal necessary to do so is not at command, is to build some small and then larger pieces of kindling wood pyramically round a central mass of paper, dry chips, straw, or shavings, following these with about four layers of coke or coal broken small, before the paper, &c., in the centre is lit; fuel in small increasing quantities being added at intervals of time until a good body of fire is secured, and at which stage it may be said the operations of stoking begins. Then the mass of glowing fuel should be pressed nearly to the back part of the furnace-bars with the fire-hoe, and sufficient fresh fuel applied to get the heat of the water in the boiler and pipes up to a high figure, and maintain it at the boiling-point if this be found necessary, which however is rarely the case. In starting the fire, the damper in the chimney should be drawn out considerably, in order to secure sufficient draught, but after the fire has become established, it should be pushed back about three-fourths of its length, so that no undue amount of heat may escape by way of the chimney. Before applying more fuel, push the clinker-bar underneath the fire the full width of the furnace-base, removing the clinkers that may have formed during the previous hour or two; push the fire to the back part of the furnace, as previously advised, adding more fuel in the front, and repeat this operation as often as the fire and requirements of the houses make it necessary. A garden furnace should be under examination at short intervals of time from early morning onwards, until it is banked-up for the night; always being careful not to put any more fuel on the fire than is absolutely necessary to maintain the right degree of heat in the several houses and pits.

BANKING-UP.

In making up the fire for the night, in addition to the usual extraction of clinkers and addition of fuel, if coke be used, and when the furnace is half-filled, throw into the furnace a few shovelfuls of ashes, then more coke, then more ashes, and proceed thus until the furnace is filled nearly to the bottom of the boiler, finishing off with a coating of ashes at the top and front of the mass. This done, push the chimney-damper nearly home; a space of one inch only being left for the passage of the smoke. The following morning the condition of the fire should be noted. It may have burned sufficiently low to maintain the right degree of heat in pipes and houses, and at the same time consist of a good body of clear fire to start with, in which case the draught may be increased, and a little fuel and ashes added. On the

other hand, should the mass of burning fuel have become low, the method of making up the fire for the night should be altered, and less draught allowed, whilst more ashes or coal-dust should be put on the fire in banking it up at night. First thing in the morning, in addition to taking out the clinkers, the ashes should be removed from the sides of the boiler, by using the clinker-bar energetically between the bottom of the boiler and side pipes and flues of the furnace, in order to give free play to the flames; and in the case of a Cornish or any kind of saddle-boiler under and over the latter. This operation should be repeated once in the afternoon, and again in the evening, allowing the fire to burn somewhat low, the more readily to perform the work. The flues should at least be cleaned well out three times in the week during hard firing in winter and spring, beginning with the top central flue, cleaning the pipes or dome of saddle-boiler with a small hoe and brush, working these well in among the top and side pipes, &c., and afterwards drawing the ashes and soot out of the bottom flues, situate on either side of the base of the furnace, in addition to clearing the base of the boiler in the furnace.

I may here state that the tools necessary for stoking consists of a shovel-hoe, 7 inches wide and about 5 inches deep, and attached to a long stoutish iron handle, this for pushing clear fire back in furnace, and drawing the ashes from underneath; also a hoe about 2 inches wide and 1 inch deep, and attached to a long light iron handle, for cleaning out the flues; and a poker and clinker-bar combined, this necessarily being strongly made, to enable it to withstand the strain involved in breaking up and removing clinkers from the furnace.

KINDS OF FUEL.

Anthracite coal requires very little attention in the matter of stoking; the large lumps should be put on the fire unbroken, that is, if they are not too large to conveniently place in the furnace. Anthracite of the Peacock vein is the best to use. If the fire is made up, say, at ten o'clock at night, with anthracite, there will be a body of clear fire eight or nine hours later, and a good heat in the houses. Seeing that heat can be got up in a much quicker time with coke, it will be advisable to have some coke to start with in the morning, and afterwards to make use of anthracite. This is what may be termed hard coal; and the various kinds of house-fuel of a softer nature burn much more quickly than hard coal, and consequently are not only more expensive to use for hot-house purposes, but they require more attention in stoking.

BOILERS.

Having had practical experience of many types of boilers, including the several supposed improvements, also the old-fashioned saddle, I have come to the conclusion that for efficiency, durability, and economy of fuel and labour, there is none to equal the upright and horizontal tubular boilers. The horizontal boiler, on account of its make, requires a much shallower stoke-hole than that necessarily required for the upright tubular, a circumstance greatly in favour of the horizontal boiler. With the exception of the latter, all other descriptions of boilers referred to above have ash-pit doors, which, in connection with the chimney-damper, are used to regulate the draught. The tubular boiler will burn almost anything, from brushwood, stems of trees and roots, cleft and otherwise. Like many other things, young men of intelligence and application learn as much in the "art and

science" of stoking in three years as others lacking these qualifications manage to acquire in twice that length of time.

Stoking does not consist simply in removing clinkers and putting on fresh fuel; on the contrary, great care and judgment on the part of the stoker are necessary in order to maintain the proper degree of heat in pipes and houses, exercising due discretion in the matter of regulating the draught by means of ash-pit doors and the chimney-damper, so as to prevent the temperature in the houses getting too high, or the boiler from boiling over. Where the boiler is large enough to heat four ranges of houses, or is put in to heat two structures in the first instance, with the intention of adding two more in the near future, it requires the exercise of extra watchfulness and care on the part of the stoker to prevent the water boiling over at the supply-cistern or the expansion-pipe occasionally. It is a faulty practice to open the furnace-door to allow the heat to escape therefrom into the stokehole, with a view to preserving a steady heat. The practice carries condemnation with it, and goes to show clearly that more fuel than was necessary was put on the fire, and as a consequence precious heat was wasted. The stoker should, by attention and practice, understand the "music" of the boiler when the water is getting very hot, and shape his actions accordingly. *H. W. W.*

CRINUM CAPENSE.

In the less cold parts of these islands, this fine hardy bulbous plant grows and flowers well if afforded a warm situation, and a little protection in winter. The plant illustrated (fig. 29), of which a photograph was kindly sent by Mr. Goetling, gardener at Lisle House, Bournemouth, was not grown entirely out of doors, but was wintered in a cool shed, and turned out of doors on March 15, and shifted into a large No. 4 pot. During the summer it made vigorous growth, and started seven young bulbs—originally it was a single bulb.

Altogether sixty-one blossoms were formed on seven spikes, truly a grand plant, and very fragrant! It was lifted and put into the conservatory, to shield it from weather, on the 4th of September, and the first bloom opened on the 15th of that month, and the last was cut on November 1. Its total height was exactly 6 feet. The colour of the flower is white, flushed with red. Of this species there are several varieties, all beautiful.

ORCHID NOTES AND GLEANINGS.

A FINE SPECIMEN OF PERISTERIA ELATA.

A CULTURAL note on this plant in the issue of the *Gardeners' Chronicle* for December 23, 1899, served to recall to my memory a fine specimen I saw in bloom in the gardens at Cliveden, last summer. On going through the houses there quite lately, I noted the same plant again, and gained a few particulars of the mode of treatment accorded the specimen which has flowered so regularly for several years past. In August last this plant, now growing in a No. 1 sized pot, produced nine spikes, some six feet or more in height, with 486 blossoms, or an average of fifty-four to a spike. This is probably one of the finest specimens of *Peristeria elata* existing in this country, and it appears to be an advance on Mr. O. Thomas' plant shown at one of the Royal Horticultural Society's meetings in 1898 as regards the number of the flowers. It would be interesting to know how the Frogmore plant bloomed during the past summer. Six years ago the plant at Cliveden was growing in a 9-inch pot, and for the past year or a longer time it has filled

a No. 1 size, and is now finishing up eleven fine growths. The cultural details are simple: The plant occupies the same position, a light one, in a moist plant stove all the year round, and is afforded a plentiful supply of water while growing, and occasionally weak liquid manure made from cow-dung. Less water is required after the growths are made; and plenty of drainage materials is an essential. The compost consists of the fibre of pasture loam only, and peat in the proportion

sum, and *O. luteo-purpureum*, from the crossing of which two species resulted. With all three under examination it is very interesting to note the features of each of the parents in the hybrid. The first thing which presents itself in *O. × mulus* is the distinct Hawthorn-scent of *O. gloriosum*. Then it is seen that its texture is harder, less fleshy and thinner than that of *O. luteo-purpureum*, while the outline of the sepals and petals distinctly indicates *O. gloriosum*, the colours and the

FIG. 29.—CRINUM CAPENSE.

of two of the former to one of the latter, together with a liberal quantity of sharp sand. No sphagnum-moss is used for surfacing, a little loam fibre being preferred. Mr. Bacon, the present head gardener at Cliveden, is justly proud of this fine specimen. *Visitor.*

ODONTOGLOSSUM × MULUS.

It is not often that one has the pleasure to receive flowers of a natural hybrid Orchid, together with flowers of the two reputed parents. Joseph Broome, Esq., Sunny Hill, Llandudno (gr., Mr. A. C. Axtell), however, has sent me flowers of *Odontoglossum × mulus*, and of *O. gloriosum*.

expansion of the front lobe of the lip and its jagged margin tells of *O. luteo-purpureum*. Its inflorescence, too, is much more liable to branch than that of *O. luteo-purpureum*. The most curious result of the crossing is seen in the column, its wings, and in the crest on the lip, which are distinctly intermediate between the two species which in themselves differ widely in those characters. The variety, flowered out of an importation by Mr. Broome, is a very fine and brightly coloured one. The sepals are chestnut-brown, with an irregular yellow bar across each, and a bright yellow tip; the petals are creamy-white at the base, and yellow at the tip, finely blotched with red-brown. Lip

yellow, with a white crest, in front of which is a red-brown blotch. It closely resembles the form illustrated in the *Gardeners' Chronicle*, 1886, N. S., vol. xxv., p. 13. J. O'B.

LÆLIA JONGHEANA.

Many who have plants that have now opened their blooms for the first time will be disappointed with this. It will be called "starry." This is not to be desired where form is a desideratum, but there are points in this *Lælia* which recommend it to those who look for more than temporary bloom. It will prove a useful adjunct to hybridists whereon to work. I would advise everyone to cross every bloom they have with *Sophronitis grandiflora*, or *L. anceps*, or with any large bloom with a well-coloured lip. The dwarf habit of the plant, and its strong constitution, will conduce to its producing a fine race of hybrids. If it were red, as is *Sophronitis*, it would be the greatest possible acquisition. Even as it is, it is most beautiful, and the plants have not yet attained full development. Next year when well grown, the blooms will be broader in all their parts. I have seen many

FIG. 30.—*GALANTHUS NIVALIS* VAR. *SCHARLOKI*.

plants, but not a large proportion of spikes. It may interest some to know the treatment afforded this species at Rosefield. I have some thirty plants capable of blooming, having from six to fifteen pseudo-bulbs, and one to three leads; and nine plants in bud. They were put into pans and placed on the south-side stage of the Cattleya-house close to the glass; they did badly, were transferred to a cool-house, and hung up all the summer. They were brought back to the Cattleya-house in October, and hung up against a glass partition. There will be variations in colour and form, and when the "hololeuca" comes, then the fun will begin, and people will approve of it. De B. Crawshaw, Sevenoaks.

LÆLIA SUPERBIENS.

This stately old species seems to require a favourable and sunny locality in which to produce its fine spikes of large handsome flowers, for in the neighbourhood of town it seldom flowers, though where better situated it flowers regularly. Such is the experience of Joseph Broome, Esq., Sunny Hill, Llandudno (gr., Mr. A. C. Axtell), with whom it flowers well and regularly, and who now sends a good example of it. The flowers have narrow sepals and petals extending about 6 inches from tip to tip, of a bright lilac-rose. The lip is of a dark rose-tint, with a number of large, raised, yellow keels running down the centre.

PLANT NOTES.

GALANTHUS SCHARLOKI.

ODDITIES (if one may be permitted to use the word) are by no means uncommon among Snowdrops, yet few, the writer thinks, are more singular than the form of *Galanthus nivalis*, known as *G. Scharloki* (fig. 30). From the time when it first pierces through the soil, it is easily seen that it is distinct, the divided spathes having an influence even at that early stage, by exposing the segments of the flowers. It is singular to see the little ball-like flowers showing between the spathes. More peculiar still, is the way in which the spathes curve down on each side of the blooms at a later stage. These spathes have been likened to a pair of wings, but they remind the writer more of curved horns. The distinctness of *Galanthus Scharloki* is still further shown by its possessing pale green spots near the tips of the outer segments. From *Galanthus Scharloki* Mr. James Allen has raised several seedlings which are inter-

of his countrymen who are the owners and cultivators of land, and who, by their apathy and want of enterprise, have allowed others from over the seas to invade our markets, and take away our gold—the gold which, under happier auspices, would have found its way into the pockets of our sadly depleted and impoverished rural population. This is not written in any carping spirit of envy as regards those who find it to their advantage to send us their surplus supplies to fill the void created by our apathy at home; rather are we grateful to them. Indeed, there are many kinds of second-rate exotic fruits which we cannot grow out-of-doors in this country, such as Oranges, Bananas, Guavas, Indian Figs, &c., which are always a welcome addition to our dessert. But after all, what are these in importance and value as compared with the hardy fruits we can grow at our own doors. Take the homely British Apple, for instance: for home and general consumption, it is of a thousand times more value as an article of food for our people than all the foreign fruit put together; and yet we import far more of this fruit than we grow ourselves. Why is this? The question, I fear, is easier asked than answered; but one emphatic remark can be made, and one that cannot be gainsaid, and that is, that the climate and soil of many counties in Great Britain and Ireland are as well—aye, better—suited for the growth of this fruit than any other part of the known globe. It is not, then, the fault of the first essential; neither can we say that the culture of the Apple is not properly understood by the majority of British gardeners; the reason must be found in some other direction.

Our country is rich in iron and coal, and a host of other manufacturing and engrossing pursuits, that a minor industry like gardening has been lost sight of by the rich, the enterprising and energetic part of our population. It is a fact also that years ago fruit among the working population was scarcely ever thought of as an article of food, but it is very different now, especially among those in towns, where fruit consumption has enormously increased. What will the consumption be, say, twenty or thirty years hence at the present rate of increase in the population? I have no doubt in my own mind that our friends abroad are taking note of this, and making preparations accordingly, and it will not be amiss to ask the question—what are we doing in England, Ireland, and Scotland in this direction?

Thanks, in a great measure, to the well-maintained and energetic action, and the now far-reaching influence of the Royal Horticultural Society, by its experiments and exhibitions, and by the work of its *Journal*, and to the enormous influence directed this way by our horticultural press, there are indications on many hands that we are at last waking up to our responsibilities and duties in this matter.

I have no means of knowing of the increase of acreage placed under fruit-trees during the past ten years, but I have observed that in the district between Windsor and London, on land adjacent both to the Great Western and the London & South Western lines, great tracts of land have been planted with fruit-trees, mostly Apples, and all appear to do well. These are mostly planted on previously cultivated land, and are chiefly half-standards and bushes. Let us hope the owners of these plantations will steer clear of the common and fatal error fallen into almost invariably by amateurs and farmers in dealing with their orchards and fruit-trees generally—the error of overcrowding. This is painfully apparent in our established and semi-established orchards all over the country.

Broadly speaking, in launching out on the business of Apple-cultivation on a large scale for profit, there are three well-defined ways of proceeding namely, the usual orchard of standard trees on grass; isolated rows, well separated, of pyramid trees on arable land; and the comparatively thick planting of bush or half-standard trees by the acre,

esting as studies of the working of heredity, although none are exactly like the parent. One or two have divided spathes, and some have green markings on the outside of the outer segments. None of the four or five I have here are as pretty as the parent—for it is pretty, despite its uncommon features. We owe the discovery of this interesting little Snowdrop to Herr Julius Scharlok, who found it in the valley of the Nahe, a tributary of the Rhine; and Professor Caspary named it in honour of its discoverer in 1868. Unlike some Snowdrops which break away from the normal form, *G. Scharloki* is a capital doer. S. Arnott, Carsethorn-by Dumfries, N.B.

THE APPLE.

WHEN last autumn I had the pleasure of listening to Mr. George Monro's lecture at the Drill Hall on the great expansion of the fruit industry, and of the enormous increase in the consumption of fruit which has taken place throughout this country during the last twenty years, I must admit that the pleasure was mingled with a thought of sadness at the admitted fact that the increased supplies in nearly every instance had been supplied by other countries than our own. I could not but feel that Mr. Monro had unconsciously formulated a damaging and true indictment against those

also on cultivated land. Each plan has its advocates, and no doubt each one has some particular merits of its own, more especially in its adaptation to certain conditions; but given that, the sole object is a matter of profit, then there is no doubt that the orchard on grass is out of the running altogether, especially for the first twenty years.

Where the farm or market-garden is of moderate extent, or larger, there is no doubt, in my opinion, that the planting of the trees in rows, at wide distances apart, is far and away the best system to pursue. Its advantages are many. In the first place the trees have the full benefit of all the light and sunshine during the year, and also all the rain that falls, as well as the advantage of not having the roots of neighbouring trees contending with them as to which tree shall have the lion's share of the soil's fertility. I need scarcely say that these advantages are the prime essentials to the growing of a perfect, symmetrical, fruitful tree—a tree capable of bearing a crop of first quality fruit from base to summit. This cannot be said of a tree grown in a thicket amongst others: from such a tree second-quality fruit only can be expected, and that chiefly from the topmost branches. Another advantage I claim for this system is the easy facilities afforded for pruning, collecting the fruit, and, if necessary, spraying the trees. Yet another advantage, and one not to be despised, is the shelter it affords to other crops of lower growth, which may be planted between, whether of bush-fruits, vegetables, or flowers for sale. *Owen Thomas.*

IRELAND.

THE ROYAL HORTICULTURAL SOCIETY OF IRELAND.

THE schedule of the above society has been issued, which makes it their seventieth: the list of prizes and awards for the four forthcoming shows are similar to those of previous years, with the single addition of a Silver Challenge Cup of the value of £10 sterling, which has been presented by Messrs. West & Son, Collopy Green. The council have agreed to make a new class for Roses, and to give the cup as the premier prize with money added by a few friends; and the stand to comprise Teas and Noisettes, and consist of eighteen blooms in at the least twelve distinct varieties, and not more than two of any variety. The balance-sheet shows the society to have touched low water, as the amount of their account is very small. It is to be hoped that by the end of the season the society will be brought into a more flourishing financial condition. The secretary of the society is Mr. W. H. Hillyard, 61, Dawson Street, Dublin.

TOBACCO CULTURE IN IRELAND.

In connection with the experimental farm which is attached to the Donaghpatrick Agricultural Co-operative Society, it has been shown that the climate of Ireland is suited to the cultivation of tobacco. Their efforts are not, however, entirely successful, owing to the lack of expert advice in the matter of harvesting the crop, which includes the drying and curing of the same prior to marketing; the only advice they had has been volunteered by a friend from America, who gave the promoters some hints about saving the crop. The sites upon which the test was carried out were loams of two different qualities, ordinary clayey loam, and a deep clayey loam of the best quality. The variety grown in both instances was English Virginian, and was supplied by Messrs. J. Carter & Co.

The methods of cultivating the plants were similar to those adopted by Messrs. J. Carter & Co., at Bromley, in Kent, some twelve years ago. The tobacco, when cured, was manufactured by Messrs. Goodbody & Son, and when finished it weighed, in the case of No. 1, 14 lb. 12 oz., and in that of No. 2, 20 lb. 15 oz., the average return being for

35 lb. of leaf 35 lb. of tobacco, without the addition of any flavouring materials. Messrs. Goodbody referred the promoters to send a sample of the leaves to Messrs. John Ross & Co., Liverpool, and gave the following as their opinion:—"It seems to show up fairly well in quality, and smokes satisfactorily; of course, a great deal will depend upon the way in which this tobacco is cured, whether it will be serviceable or not."

The means of 1899 was not suitable for its proper cultivation, as the wet autumn was unfavourable to the ripening of the crop. The cost of production, however, will hamper cultivators, as they lack one essential feature, the absence of sun-heat for drying. This will entail the use of fire-heat, which will be a serious item when large tracts are under cultivation; the cost of manufacturing has been reckoned at 4d. per lb., and the excessive revenue duty is 2s. 6d. per lb. If its cultivation is to be helped, the fiscal policy must be modified, as the excise authorities would simply kill the industry, and the return, after all expenses were deducted, would leave a small margin of profit. One lesson gleaned from their labours is, that the tobacco crop does not exhaust the soil more than Turnips, which is a great point in its favour.

The promoters intend trying this year more varieties, and to produce a higher class of tobacco; and it would be very desirable if the experiment could be tried along the west coast of Ireland, not exactly the seaboard, but some distance inland, the climate being more suitable than that of central Ireland, as for example, co. Meath, where the above experiments were carried out. An account of the experiment is published by Mr. Nugent J. Everard, President of the Donaghpatrick Agricultural Co-operative Society, Ranelstown, Navan, and from which the above extracts were taken. *A. O'Neill.*

NOTES FOR NOVICES.

THE LEAF.—It is not altogether the best season in the year to make a study of leaves; yet the gardener-student will, of course, not be at a loss for material at any time. Before us lie Tulip-leaves, Lily of the Valley leaves, and Violet-leaves; any one of them will serve our present purpose. We are not going to descant upon their general appearance, nor upon the differences in form between them. What we want to emphasise now is that all these leaves, in fact, with few exceptions, all leaves are substantially uniform in structure. There is the most astonishing diversity of outward form, but the internal structure is, in its main features, identical, however much it may differ in detail. This is not to be wondered at, as the duty of the leaf and the work it does in the plant are correspondingly uniform.

The main features just alluded to are the skin (or epiderm) which covers the whole surface of the leaf; with the point of a penknife and a little patience, the skin of a Tulip-leaf can easily be picked off. If the fragment be held so that the light streams through it, and it be looked at with a pocket-lens, it will be seen to be translucent, colourless, and made up of cells and nothing but cells—membranous bags more or less flattened, and containing no green matter (chlorophyll). With a good pocket-lens the skin may be seen to be perforated with numerous pores. These are, of course, more readily seen under the microscope, but it is well in all cases to see at first as much as possible with a simple pocket-lens, and when you can see no more with it, then and not till then avail yourselves of the compound microscope. These pores are the breathing-pores or "stomata," through which pass in either direction watery vapours and fluid. The skin of the leaf (barring the breathing pores, is mostly impervious to water, and its main office is the protection of the internal structure. Some say it does not absorb water as such at all, and indeed in some cases it is so coated with wax, felted hairs, or other impervious material, that it cannot absorb

water; neither can it, save through the pores, allow of the passage of water from the inside. The pores, it should be said, are capable of closing and opening according to circumstances.

The skin of the leaf is therefore a protective garment, and it regulates, chiefly, or exclusively, by means of the pores, the ingress or egress of watery vapour, and the constituents of atmospheric air.

Beneath the skin, easily seen on removal of a small fragment, is the pulp of the leaf, consisting of cells whose protoplasm is mixed with green substance called chlorophyll.

Speaking generally, the more complete the exposure to sunlight the more abundant and denser the green substance. In the Tulip the green substance is pretty evenly diffused throughout the leaf, because one surface is nearly, if not quite, as much exposed as the other; but in the Violet, or any plant in which there is a marked upper and an equally marked lower surface, then the green substance is densest above and thinnest beneath. As a consequence of this, the under surface of most leaves is of a paler colour than the upper.

This green pulp is the most important part of the leaf, considered as a food manufactory. Under the influence of sunlight and sufficient heat and moisture the leaf-factory sets to work to form green substance and ferments out of the protoplasm, starch and sugar out of the green matter. The chemical processes are complex, and not fully understood, but the result is that by the agency of a ferment formed in the protoplasm, the solid, insoluble starch is converted into liquid sugar or some analogous compound. This forms the food which may be transferred from cell to cell, till it reaches the growing points, where it is utilised in the construction of new cells, or, if for the moment it is not all wanted, it may be conveyed to some place of storage, such as the bark, the seed, or the bulbs, or tubers as in the Potato; the liquid matter being again converted, for convenience of storage, into solid matter. The pulp of the leaf then is of the utmost moment to the plant, and to have it in good working order is or should be a principal aim of the gardener. This may be accomplished by exposure to sun-light by an adequate supply of water, cleanliness to remove obstruction from the leaf, and an adequate temperature according to the nature of the particular plant.

Traversing the pulp of the leaf in various directions, from base to tip as in the Tulip, or broken up into a network as in the Violet, are the so-called "veins" of the leaf. The term is as bad and misleading as it can well be, but it is in universal use, and it is not quite so deterrent as the "fibro-vascular system," or the "libero-ligneous bundles." These fibrous bundles or threads consist partly of long wood-cells, which serve as a support to the pulp of the leaf, just as the bones of a bat's wing serve to support that membranous expansion. Besides acting as a mechanical support, these bundles supply conduits for the passage of fluid from place to place. The part of conduit is enacted by certain "vessels," open tubes, not thickened by woody deposit in the interior as in the true wood-cells.

It is no part of our present object to give fuller details of leaf-structure. That may come at a later stage. All that we wish to emphasise in this place is that the leaf is covered with a protective skin, with which is associated a breathing apparatus, that the green pulp is the active manufactory where the most important part of the work of the leaf in supplying food and favouring growth is carried on, and that the "veins" act as mechanical supports, whilst the associated vessels act as conduits. Speaking broadly, all leaves have these three elements in greater or less abundance, according to circumstances of climate, soil, exposure, &c.

The gardener, if he has the growth of a specimen plant in view, must consider the requirements of all three elements; but if he is growing a Cabbage, say, for the pulp of the leaf, he adapts

his practice accordingly, and devotes his attention principally to supplying the conditions favourable to rapid cell-growth.

If it is the fibre he specially wants he acts accordingly, by withholding moisture and retarding growth, and doing what he can to check the cellular and promote the growth of the fibrous tissues. *S. Retzsch*.

A CONIFER DISEASE.

In 1888, Professor Tubeuf described a disease attacking the young shoots towards the summit of seedlings, also the lower twigs of older plants of the

and has shown by artificial infection with its conidia that the Silver Fir, Spruce, and Larch, are also susceptible to the disease. He has also observed *Juniperus communis* with its young shoots killed, and sclerotia resembling those of *B. Douglasii* present.

In this country a considerable number of seedling *Wellingtonias* have been killed, the symptoms being in all respects identical with those indicated by Tubeuf (fig. 31). The fungus, however, does not appear to be a new species as supposed by Tubeuf, but our old and well-known enemy, *Sclerotinia Fuckeliana*, the conidial form of which is known as *Botrytis cinerea*. Behrens has arrived at a similar

Preventive measures.—When the disease once appears, its spread is very rapid, especially during damp, cloudy weather in the spring, owing to the rapid diffusion of conidia which attack the young tender leaves, the mycelium passing from thence into the shoots. Spraying with dilute Bordeaux Mixture, or perhaps better, with a solution known as "Violet-mixture" should be at once resorted to as a check to the spread of the pest; all plants in the vicinity both healthy and diseased, should be well sprayed, using a nozzle that gives a very fine spray, so that the material remains on the parts sprayed.

Past experience shows that plants once attacked invariably die, hence all such should be promptly removed and burned, as pruning the diseased parts is out of question in the case of most Conifers, especially where the lead is attacked, and this portion is usually the first to suffer. The ground should also be well drenched with the spraying mixture, for which purpose a stronger solution may be used with advantage, otherwise the fallen diseased leaves will continue to furnish a crop of conidia.

Diseased shoots and leaves after being kept in a dry box for four months, yielded a copious crop of conidia after being moistened and kept in a damp place for ten days. This experiment proves the necessity of removing from the ground all fallen leaves and shoots, as sclerotia form abundantly in such dead portions of the plant.

"Violet-mixture," which is quite as efficacious as Bordeaux Mixture, adheres to foliage better than the last-named solution, and does not leave a white deposit on the plants sprayed.

Copper sulphate	2 lb.
Copper carbonate	3 lb.
Water	18 galls.
Potash	3 oz.

All the ingredients are soluble in cold water. *Geo. Massee.*

FIG. 31.—SEQUOIA GIGANTEA ATTACKED BY BOTRYTIS CINEREA.

- 1.—Terminal shoot of *Sequoia gigantea* attacked by *Botrytis cinerea*. Nat. size.
- 2.—A fruiting-branch of the *Botrytis*. $\times 400$.
- 3.—Portion of a *Sequoia* branch with sclerotia. $\times 10$.
- 4.—A single sclerotium imbedded in the bark of a *Sequoia* branch, producing the *Botrytis*-form of fruit. $\times 80$.

Douglas Fir. The disease is characterised by the withering and curling up of the shoots, which soon become denuded of leaves, and eventually the entire plant dies.

When the first symptoms of disease are observed, the portions attacked are seen to be covered with a dense outgrowth of grey mould, and after the twigs are dead numerous small black sclerotia, about the size of a pin's head, may be found embedded in the bark, and also in the tissue of diseased, fallen leaves.

Tubeuf named the parasite *Botrytis Douglasii*,

conclusion to myself as to the identity of the fungus.

Artificial infection with conidia proved that the Scots Fir is also susceptible to the disease, and perhaps the same is true of most Conifers; plants belonging to other groups, as Vines, Cherries, &c., have also been recorded as having been artificially inoculated. On the whole, coniferous seedlings appear to suffer most, the disease often spreading rapidly, and doing much mischief if not promptly checked. The disease has also been recorded as occurring in the United States.

FORESTRY.

PARK CLUMPS OF TREES.

To render a park clump really attractive, and in harmony with the prevailing surroundings of ordinary park scenery in the Midlands or south of England, it must have a certain amount of resemblance to the clumps or groups found in natural forest scenery, for, after all, a park in its honest form is only an open forest deprived of its rougher growths of brushwood and thicket. Smooth stretches of turf dotted over with well-balanced "specimen" trees, while pleasing enough in a way, and appropriate enough in the vicinity of the mansion or the pleasure-ground, cannot be considered as elements of ideal park scenery unless relieved by parts more densely timbered, and of a wilder growth, which give the necessary touch of Nature to the scene before us, and which carry out the idea of transition from the artificially kept or dressed grounds on the one hand, and the natural forest, heath, or chase, on the other. The clump is the connecting link between the single tree, and the larger area which takes on this forest character more closely, and in small parks may have to take the place of the latter entirely, owing to want of space, or considerations connected with the view. Density, and a perfectly regular distribution of the trees (both of which have much the same effect), are objectionable features in such clumps, for they fail to conform to that broken and constantly varying character which is the chief beauty of park timber. The most picturesque types of the latter are found in two or three trees standing so close together as to form but one crown between them, stunted or pollarded trees of great girth, trees which divide into two or three stems close to the ground, or stems with aged thorns or crabs springing from their bases—in short, anything due to accidental causes, from which years of subsequent growth have removed the abruptness or disfigurement without restoring to a normal condition.

How, then, can similar results be obtained in clumps formed by artificial means? Certainly not in the manner described and condemned above, as hundreds of instances can be found to prove. If a natural effect is really desired, these clumps must be raised in somewhat the same way as Nature produces the results described, i.e., by a careless disregard of all formality and stereotyped methods of planting. A patch of thorns or brambles establishes itself, and under its protection a few seedling Oak, Ash, or Beech, manage to reach a few feet in height. In some instances, the whole group stands on a yard or two of ground, in others a greater distance separates them, and according to the space at their disposal, so is the shape of the crown or crowns determined. A. C. F.

(To be continued.)

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Raspberry Plantations.—The time has arrived when the canes may be finally thinned, tipped, and tied either to stakes or wire trellises. The best results are obtained when the canes are fastened to trellises, as each cane then stands apart, and yields fruit from top to bottom. A great crop of fruit may be gathered when the canes are tied in fives or sixes, bending these over and fastening the canes from two stools to one stake. If the market method of growing Raspberries be adopted, no stakes are required, as the rule is simply to shorten the canes to 4 feet, and leave four or five of the best on each stool. Some growers put a strand of raffia or string round the canes near the tops, so as to hold them together out of the way when horse-labour is employed to work the ground between the rows. Where stakes are used, the canes should be secured to them by means of tarred-twine or Osiers, but, in the case of a trellis, raffia or common bast is needed. If not already done, the canes of autumn-fruiting varieties should be cut down close to the ground, the fruits coming on the current year's growth. Raspberries succeed best on deeply-stirred and rather heavy soil, and as this is a crop that generally remains on the same piece of ground for a number of years, new plots should be heavily manured and deeply dug. It is not too late to plant this month, providing the preparation of the plot is undertaken forthwith. Superlative is a sterling variety to plant. Another is the new yellow-fruited variety, Guinea. The best autumn-fruiters are October Red and Belle de Fontenay. Semper Fidelis—very acid—and Northumberland Fillbasket are good either for field or garden. Newly-planted canes should always be cut down to within 3 inches of the soil in all cases before or soon after planting.

Tree-Protection.—The frosty weather has given the Apricots a needful check, for the buds were swelling fast before it came. When the flower-buds are forward in this month as they are this year, there is a danger that hard frosts will destroy a great number. If the wall is furnished with copings of glass, or of boards, and these are now in position, fish-netting may be let fall in double or treble thicknesses from the copings, and kept off from the wall by means of poles whenever danger to the flowers is feared. With regard to Peaches, Plums, &c., there is full time to make provision for their protection.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Dendrobium Wardianum, D. nobile, &c.—Various Dendrobiums are imported at this season, and those whose stock needs to be replenished would do well to secure a fresh supply as early in the season as possible, so that the whole of the growing season may be utilised for their establishment. D. Wardianum is a notoriously short-lived species under cultivation, and any obtained now may be put into pans at once, just large enough to hold the base, filling in with crocks to near the rim, surfacing with peat and sphagnum-moss in equal proportions. Secure the old bulbs to the wires, so

that they will not sway and loosen the base, but when the young growths develop, allow these to droop as they will. Suspend the pans in a light structure where a temperature of 55° to 65° is maintained, and until root action has commenced afford only sufficient water to keep alive the sphagnum-moss. The above remarks apply equally to D. crassinode, D. nobile, D. Findleyanum, D. aureum, D. lituiflorum, D. Devonianum, D. primulinum, and D. crepidatum, which, however, require stove-treatment whilst growing.

Thunias.—At this season repotting should be performed as soon as the roots appear, and the young growths have made an inch of growth. The potting compost may consist of two parts fibrous-peat, and one of fibrous loam and chopped sphagnum-moss, a small portion of pulverised cow-dung, together with a good sprinkling of very small crocks and sand. Let all old material and roots be removed to within 2 inches of the base of each pseudo-bulb; having done this, select 5-inch pots for a strong, single pseudo-bulb, or a 7-inch one for three or more pseudo-bulbs, according to their strength. Place a large crock over the hole at the bottom of the pot, insert a stake in the centre, and more crocks, nearly filling the pot, and over these place a layer of rough sphagnum-moss, and afterwards the bulbs, tying these to the stake. The compost should then be filled in to nearly the level of the rim, and over the base of the new growth. The material should be made moderately firm, well incorporated, and the growths placed so as to look outwardly from the centre. In order not to excite the plants unduly, place them in a light, not over-warm position, say the warm end of a Cattleya-house; afford a slight spraying occasionally, especially on bright mornings, and increase the amount of moisture as the season advances. When the roots reach the sides of the pots, water in good quantity may be applied whenever there are appearances of dryness.

Pleione humilis.—As this species flowers till this month, repotting may be done when the flowers fade. Other species are repotted in November. If the compost is well preserved, and other circumstances are favourable, nothing need be done before growth has made considerable progress, when a top-dressing of chopped moss and sand may be afforded. Those requiring removal from the pots should be taken out in clumps, and not separately, as with the other species, the decayed materials and dead roots being picked off. Let the clumps be inserted in pans three-parts filled with clean crocks, and above these place a compost consisting of Orchid-peat two parts, fibrous-loam one part, and chopped moss one part; sufficient finely-broken crocks and sand being used as will give free outlet for water. The plants when repotted should be stood in the Masdevallia-house near the roof. Afford water sparingly through a fine rose water-can, and after growth has begun to progress freely, a more liberal supply will be needed.

Pleione lagenaria and Wallichiana growing in the same house are making steady progress, but these need only as much water as will keep the compost moist.

P. maculata growing in the Cattleya-house should be afforded water more liberally, it being in a more advanced stage, but saturation of the materials should be avoided, or the tips of the leaves will turn of a brown colour.

General remarks.—Extremes of outside temperature occur at this season, and damping-down and applying water call for much care on the part of the cultivator, or those in charge of the plants; much evaporation of moisture occurs when strong fire-heat is used at night, still, no more water than is necessary should be thrown about the floor in the afternoon. Air may be admitted by the ventilators near the floor whenever the conditions are favourable, closing them early in the afternoon. Plants in a dormant condition should not be excited by exposure to high temperatures and a saturated atmosphere.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

Conservatory and Greenhouse.—There being at this season an abundance of plants available to keep these houses bright, the first opportunity should be taken to remove those which have got past their best, or are no longer needed. Re-arrange

the plants occasionally, and where convenient, group a family—say Narcissi in variety—in one mass. Many plants are far more effective in a group than when mixed with others, and a thorough change can thus be easily made, which is always refreshing to the eye. During cold weather, ventilation will require careful attention, the fires being stopped, or the heat diverted from the pipes, if the day is likely to be sunny. The application of water should be made early in the forenoon, remembering that a rather dry atmosphere is favourable to the endurance of the flowers. Solanums may, when removed, be cut over, and then stood in pits out of the reach of frost, planting them out later on. Libonias only require the shoots to be shortened, and the plants out in proper shape: place in a cool-house, and repot them later on. Let the faded flowers and seed-vessels of Azaleas be picked off, and the plants encouraged to grow by placing them in a house having a temperature of 55° to 60° (rising to 70° with sun-heat), freely syringing the heads in the morning, and early in the afternoon.

Forcing-house.—Continue to place bulbs, Azaleas, Lilac, Deutzias, &c., in heat, and remove to cooler quarters all subjects as soon as the flower-buds begin to show colour. Hippeastrum bulbs may now be shaken out of the exhausted soil, and repotted into 4½, 5, and 6-inch pots, according to the size of the bulbs. Hippeastrums require to be potted in a free, open compost, with plenty of sand added, and to be plunged in a gentle bottom-heat, such as that afforded by tanner's bark, Oak-leaves, &c.

Cyclamens.—The seedlings raised in the autumn of last year and now standing in pans and boxes should be potted into 60's, and encouraged to make slow, steady progress, by affording a temperature of 55° to 60°, and keeping them near to the glass, so that no drawing of the leaf-stalks occurs.

Imantophyllums (Clivias).—The flowers will be improved in colour if the plants are afforded liquid manure liberally. When in flower, these plants may be safely placed in the cool conservatory.

Pelargoniums should now be placed in their flowering-pots, and be freely aired when the weather is mild.

Fuchsias may be re-potted as may be found necessary, and the shoots stopped.

Roses in Pots.—The plants which are intended to flower in the month of May, should now be pruned and started, assuming that the potting was performed in the autumn, and the pots have been plunged in coal-ashes. Let the pots be washed, and the surface stirred with a pointed stick. A temperature of 50° to 55° will suit the plant for the present.

THE FLOWER GARDEN.

By J. BENDOW, Gardener to the Earl of Rochester, Abbotsbury Castle, Dorset.

Coniferous Trees.—Almost every species of Conifer which may have lost the point of the stem from any cause may have the symmetry of the tree restored by selecting a well placed lateral shoot, and fixing it to an upright stick fastened to the stem with twine over a few caoutchouc bands. The leader being fixed in its place, vigorous side growths about the apex of the tree should be cut back slightly. Conifers of dense growth, as Juniper, Cupressus, and Biota are frequently weighed down with snow, in which event the branches should be forthwith tied back with strong tarred cord, thus avoiding the loss of branches not easily replaced. Young trees may now be easily staked, the ground having become moistened by rain and snow. The use of strong Oak-quartering with the flat sides to the tree, or of three Ash-stakes joined at the top, are useful modes of staking trees. Care must be exercised, however, in tying the trees so as not to allow the bark to be injured by friction.

Propagation and Culture of Yuccas.—Varieties of Y. filamentosa and Y. gloriosa are among the most useful that may be planted in the sub-tropical garden, and if given a little care during and immediately following frost, they will prove hardy and long-lived. Yuccas are effective when used as "dot" plants in large beds on the lawn, or when planted by the side of paths adjacent to the mansion. Grouped together on raised mounds, with Daffodils, Snowdrops, Chionodoxas, &c., growing under them, or planted here and there on the

sunny side of shrubberies where the bend or belt of shrubs forms a bold front, they will be admired. Yuccas are not very particular as to soil. They succeed in a sandy loam, enriched with thoroughly-rotted manure, and made porous by the addition of a good proportion of old mortar-rubble. Propagation can be easily effected from the root-stock, by taking up now any very old roots of plants that are broken or decayed. When such roots are examined, there will be found clustered about them many buds or points similar to those of a Jerusalem Artichoke. Each of these should be so severed with a sharp knife as to secure to the growth a good heel. Pot them separately into 5-inch or 6-inch pots, and use a compost of sandy loam and leaf soil. Manure at this stage might cause decay. Plunge them closely together in a hotbed of leaves, and give them a thorough watering, which will be sufficient till growth has commenced. Spray the leaves occasionally on bright days. It is necessary occasionally to remove aged plants owing to decay or other cause, and in such cases the large growths may be treated as cuttings. They should be severed with a saw at a point where the growth is sound, immediately below the leaves. At Abbotbury this method of increasing the stock is in every respect successful. The operation should not be commenced until May or June. A bed or border in full sunshine should be prepared in the meantime for the cuttings. Raise the soil above the level, and use a compost of two parts leaf soil, adding one part loam and one part grit. Make this firm by treading it. Plant the cuttings firmly by using a spade, and placing them against the side of a trench, subsequently treading the soil in—or make a large hole with a crow-bar; in either case insert the cuttings up to the leaves or collar, and give them a soaking of water. They will make roots during the first year, and may be afterwards planted in permanent positions. During such severe weather as the present, even though the plants may have been tied up, or given what protection is necessary by means of bracken or similar material, a close watch must be maintained. Directly a thaw occurs, the tissues of the stems become relaxed, and the plants may collapse through being top-heavy, if not well supported with stakes and props. Mats may be used to prevent a too rapid thawing of the stems. Experience gained a few years ago during a spell of 20° of frost, proved that when the stems, after bending over to the ground, were replaced and supported, no injury resulted, but otherwise the plants would have been disfigured, or broken off entirely.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Rhubarb.—Every third year a part of the stock of roots should be re-planted; and if it be deemed advisable, the position of the bed should be altered. It is well to have at the least some part of the stock in the full sunshine. Rhubarb may be grown in the same position for several years, providing the soil is of good depth. For several years I have adopted the following plan, and found it to answer. A portion of a bed is lifted yearly for forcing, and the ground is manured and trenched, and the surface left in a rough state till the present month. I then lift and divide a number of strong crowns, plant the pieces each with a bud at 5 feet apart in ground that has been trenched, and cover the entire surface with a 3-inch layer of spent Mushroom-bed dung. The Rhubarb plant suffers if the stalks be pulled too severely, so that it is necessary to plant sufficient roots to yield a fair supply without having to be severe on the plants.

Chicory.—As the supply of Endive and other saladings becomes short, Chicory will fill the gap between the late and the early-sown Lettuces. The roots of Chicory should be lifted, and the tops trimmed off to within an inch of the crown, and the roots placed in light soil in boxes or pots in a Mushroom-house, or in pits from which all light is excluded and there is a warmth of 60°. Not many roots should be forced at one time, the leaves becoming coarse and tough if left to grow to any great length. If the young leaves are not cut too close to the crowns, a second and more tender crop may sometimes be obtained from forced roots. The common and the large-rooted are good, useful varieties, but the Witloof has the largest heads.

Onions (autumn-sown).—Larger bulbs and a more even crop are produced from seed sown in beds or

pits, and transplanted into a plot of ground which has been well trenched and manured, than when sown in the open ground and thinned afterwards. Onion-plants in pits and frames should not be odded, so that when weather is sufficiently mild they may be planted outside without fear of a check. The lines of Onions in the open always require the soil to be made firm by trampling on either side carefully, and some soot spread over the land in order to prevent the worms from drawing down the leaves.

Spinach.—The prickly-seeded variety has withstood the winter well so far, and as an aid to growth weeds should be kept under, and guano, sulphate of ammonia, or any other fertiliser, sprinkled between the rows, and lightly hoed or forked into the soil. In the spring sow seeds of the Victoria Improved round-leaved Spinach on land in a warm site.

Turnips.—Seeds of Carter's Early Forcing (in shape like a Mammoth Radish), an excellent variety, and Early Milan, should now be sown in pits on mild bottom-heat, the bed consisting of light soil, compacted by a light treading, or by being patted with the spade. Sow in rows 9 in. apart, and during the continuance of frosty weather, cover the glass with mats and litter, air being freely afforded in mild weather, after the seeds are germinated. Never let the plants flag for lack of water.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Tomatoes.—Where a light house occupying a sunny position is at the command of the gardener, the first batch may now be planted in boxes and brought as near to the glass as may be convenient. Boxes having a width and depth of 10 inches, and 3 or 4 feet in length, are convenient for the purpose. To fill them, employ good fibry loam and bone-meal, with the addition of a little burnt garden refuse. Select sturdy plants that have been grown under cool conditions from late autumn-sown plants, and place them 1 foot apart in the boxes, and the same distance from the glass. Keep a steady temperature of 60°, and a rather dry atmosphere, and afford free ventilation in mild weather. Any plants raised in the autumn from seed, and which are now in flower or fruit, may be shifted into pots, stopped at the fourth truss, and pushed forward for an early supply.

Vines.—Late Vines from which the fruit was cleared, and the Vines pruned in December, are in a fit condition for starting. Any renovating should have been completed at pruning-time, and nothing should now remain but to keep the borders steadily moist. An early start is of great advantage to late Grapes in affording a long season of growth, and the time to ripen the fruit in early autumn under favourable conditions; and the expenditure of a little extra outlay for fuel necessary for an early start is well repaid later on.

Pot-Vines.—The early Vines now rooting freely will require more liberal applications of water, and the plants with rapidly-swelling fruit will be benefited by clear liquid manure being applied alternately with clear water. When a good bed of coarse material, consisting of fibry loam and dung has been made, in which the roots may extend through the bottoms of the pots, this should be kept in a healthy, moist condition. The temperature may be raised to 65° at night and 75° by day, and advantage taken of sunny days to maintain a good degree of heat for as long a period as possible.

Second Early Vinerias.—Let the Vines be relieved of superfluous bunches, sufficient being left on the Vines to admit of a slight reduction after the fruit is set. Keep a night temperature of 65° during the flowering period, and a few degrees higher during the day. A dryish atmosphere and free ventilation should be afforded during the early part of the day, in order to have the pollen in a dry condition by midday, when a gentle tap on the rod or lateral will set it free in clouds. This is sufficient to ensure a perfect set, except in cases where the stigma gets covered with a globule of moisture. Where an examination reveals this condition, the bunches should be sharply tapped, following up the tapping directly afterwards by an application of pollen from

some free-setting variety. Thinning should be commenced as soon as possible after the pollen is exhausted. The berries which are best set always swell to the largest size, and are easily distinguished in the earliest stage by having strong foot-stalks. In thinning bunches of Grapes, a bold hand is very desirable, and the work should be carried out at one operation—nothing exhausting Vines more than leaving double the quantity of berries required in a bunch, which will have to be removed after the stoning period is passed. After thinning, every care must be taken to keep the foliage in perfect health, and any bare spaces on the trellis should be filled-in with young laterals which carry no bunches. Careful ventilation will be necessary to prevent cold currents of air injuring the tender skins of the berries. Avoid an excess of atmospheric moisture, as it tends to produce foliage deficient in substance; give it most freely during bright sunny weather.

THE APIARY.

By EXPERT.

Condition of Bees.—A great deal of unnecessary harm is done at this season of the year by anxious bee-keepers disturbing their bees. It does no good, but, on the contrary, it does much harm. If you are sure they have not sufficient food, place candy cake on the top bars, but do so very quietly and quickly, so that the bees are not disturbed. If this is neatly done, all will be well, but to cause the bees to come out in cold weather means loss of time, and this is sure to be shown by the stocks being weak in the spring; and by the time they have built themselves up, the honey flow is over. All hives should be examined once a week, to ascertain if the roofs are watertight (of course, iron roofs would not need it at all), to remove damp cloths and afford fresh ones. The bee-master will, after he has wrapped up his bees, place on the roof several layers of newspaper, which form an excellent covering, particularly if he have an additional cover of waterproof sheeting, which can be obtained for a few pence from any waterproof maker.

Supers for the Spring.—The present is a good time to get in readiness all supers, &c., for spring use, scrubbing them with boiling-water and soda. Hives should also be got in readiness for swarms, not leaving the work till the hives are wanted.

Honey.—All sections that are not sold should be examined, and all "weeping" sections carefully cleaned, or good money will be lost by the honey running over them; and, lastly, all sections should be placed on the market perfectly dry.

VARIORUM.

THE VINE IN URUGUAY.—From a recent report by the Uruguayan Bureau of Agriculture, we learn that in the Caralones department, in 1896-97, there were 230,200 American Vines in nurseries, and 617,800 at the end of August last. The number of Vines transplanted and growing were, for 1896-97, some 149,000, and for the year ending in August last 196,334. The amount of Grapes produced in the department increased last year to 383,530 kilogrammes—showing that the pest of the phylloxera had actually increased the production, owing to the restoration of vineyards and the augmented acreage devoted to their culture. In the department of Monte Video the plants in nurseries, in 1896-97, were 1,288,800 of the American variety, and 2,826,100 in 1899. The Vines transplanted in the former period were 262,900, and in the latter term 104,300. The smallness of the latter figure, compared with the former, is due to grafting—there having been 12,700 Vines grafted in the nurseries, and 379,782 in the vineyards. The production of Grapes in 1896-97 was 938,400 kilogrammes; for last year the production was 1,481,740 kilogrammes. It will thus be seen that the joint vineyards have improved in production, notwithstanding the plague of the vine-louse, and this improvement is due to restoration of Vines and increase in number of vineyards.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, FEB. 22 { Annual meeting of the Kew Guild
in the Garden Library, Kew, at
8 P.M.

SALES.

MONDAY, FEB. 19.—Fruit Trees, Palms, Roses, Hardy Perennials, &c., at Frotheroe & Morris' Rooms.

WEDNESDAY, FEB. 21.—Japanese Lilies, Palm Seeds, Continental Plants, Herbaceous Plants, &c., at Frotheroe & Morris' Rooms.

FRIDAY, FEB. 23.—Imported and Established Orchids at Frotheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—33°4'.

ACTUAL TEMPERATURES:—

LONDON.—February 14 (6 P.M.): Max. 39°; Min. 33°.

Cold thaw; rain; sleet.

PROVINCES.—February 14 (6 P.M.): Max. 42°, West Ireland; Min. 34°, Home Counties.

The Royal Horticultural Society. The annual meeting was held on Tuesday last in the Lindley Library, Sir TREVOR LAWRENCE presiding. The Report, the greater portion of which was printed in our columns last week, was made the subject of running comment by the President, who indeed may pride himself on the progress the Society has made. Sir TREVOR deserves the gratitude of the Fellows for the way in which, through evil report and good report, he has stuck to the Society. Now that there is once more a vacancy in the list of Victoria Medallists, we hope Sir TREVOR will be induced to overcome his scruples, and place himself where he ought to be—at the head of that select body.

The sum spent on the Library, small though it be in proportion to the income of the Society, is nevertheless well expended, and the gratitude of the Trustees and of the Fellows at large may be tendered to the Council for this most judicious expenditure.

The new Charter again proves to have been less expensive than we had imagined. We have not seen its provisions, but from all we learn, it must be a great improvement on its predecessors. The bye-laws will require very careful manipulation, and we hope every facility will be given for their consideration before they are sought to be officially promulgated. Every effort should be made by the Council to keep in touch with the Fellows. We mention this because no intimation—at least we saw none—was given of the proposed alterations in the Council: "No other nomination having been received, there is no occasion under the new Charter to issue a balloting-sheet." The Fellows, no doubt, ought to have known, but as a matter of fact they either did not know, or they ignored the fact, that it was

open to them to have nominated a member of Council. Again, the sentence above cited induces us to ask when the new Charter came into operation? If on November 19, 1899, there was plenty of time to have made the fact known.

Nothing but approval can be felt for the selections made; but another year we trust due notice will be given, so that if by chance the outside Fellows desire to exercise their right, they may be able to do so without incurring the risk of being too late.

The proposed removal of the experimental-garden from Chiswick, on the occasion of the centenary of the Society in March, 1904, is obviously a matter for serious consideration. The cost of obtaining land, and of re-erecting the houses and pits in a new situation, will be so large, that even if special aid be forthcoming, we cannot look forward to the prospect without apprehension.

The uprooting of old ties and traditions may be only a matter of sentiment; but even if that be so, sentiment is not without influence.

The number of Fellows who visit Chiswick is not large, and if the garden be removed further afield, the diminution will no doubt be accentuated.

It is satisfactory to note that in connection with the proposed new Chiswick, the Council hope to establish a horticultural college that shall become a real centre of horticultural education. We have always urged the necessity for such a school, and there is no doubt but the work in connection therewith could be most fittingly done by the Royal Horticultural Society.

The finances of the Society are most encouraging, there being a surplus upon the working last year of £1751. This is larger than in any previous year, and the number of Fellows at the present time is greater than ever.

For a report of the general annual meeting, see p. 110.

Examinations. Some people appear to entertain entirely wrong notions as to the purpose of such an examination as that conducted by the Royal Horticultural Society. Some think it is not practical enough, others would confine it simply to the subject of the courses of lectures on particular subjects, often not more than six, which the candidate may or may not have had the opportunity of listening to. Some talk as if the passing of an examination and the acquisition of a certificate, immediately qualified the candidate to take a head-gardener's place, or the post of superintendent of some gardening institution. Would they expect some newly-fledged M.D. at once to take the charge of a large hospital? or a midddy to take command of a battleship? And yet this is representative of what some people expect. In a pursuit like gardening, experience is the great teacher; but how can you expect a youth or maiden of sixteen or eighteen to have experience—that is a plant of slow growth.

What then is the object of the examination? Simply to direct the studies and control the education of the candidate in such a way that he may be imbued with scientific method, and learn the importance and co-relation of certain facts and inferences. This discipline is certain to be useful to him in after life. It will give purpose and direction to his work, enable him to gain experience with greater facility, and apply it with greater readiness.

In some quarters it is recommended that the

examinations for these young students should be more practical, that the candidates should, in presence of the examiner, undertake the potting of an Orchid, the grafting of a fruit tree, and so forth. This we think is a mistake. Such a test should come not as a preliminary matter, but after the candidate has passed his examination in the principles of his art. Two or three years would not be too long an interval between the entrance examination and the practical test. The interval, of course, should be filled up by practical work in the garden. The entrance examination should, in our opinion, be almost if not entirely devoted to the principles of gardening, with only incidental reference to its practice.

Teachers and examiners should recognise the fact that the object is not to turn out accomplished scientists, nor to produce head-gardeners at eighteen years of age, but men with sufficient knowledge of botany and allied sciences to enable them to benefit by their subsequent course of practical training, and profit by their gradually gained experience.

MR. J. B. CARRUTHERS, a son of Mr. WILLIAM CARRUTHERS, formerly Keeper of the Botanical Department, British Museum, has been appointed Assistant-Director and Mycologist at the Botanical Gardens, Peradeniya.

SIR JOHN LUBBOCK is to be henceforth known as Lord AVEBURY.

THE DUKE OF PORTLAND has undertaken to preside at the sixty-first Anniversary Festival of the Gardeners' Royal Benevolent Institution at the Whitehall Rooms on May 18 next.

PRESENTATION.—Mr. J. BARSON, general foreman at Eastnor Castle gardens, is leaving that place to become gardener to the Earl of SANDWICH, and on the 8th inst. the garden staff presented their departing colleague with a handsome tea and coffee service. Mr. GEO. MULLEN, head gardener, made the presentation, and expressed the hope of all the employees in the garden that Mr. BARSON would be successful in his new position. The Eastnor Castle Cricket Club also wished Mr. BARSON success, and made a presentation of a marble timepiece.

RETIREMENT OF MR. A. HENDERSON, OF THORESBY.—On the death of his noble employer, Earl MANVERS, Mr. HENDERSON had an annuity left him, and he resigns his charge of the gardens at Thoresby after thirty-eight years pleasant and happy service, during which long period of time he has always received the greatest of kindness from the family. His foreman, WILLIAM ROBERTSON, is his successor.

MR. J. W. WATT, a son of Mr. WATT, of the firm of Messrs. LITTLE & BALLANTYNE, Carlisle, is about to embark to South Africa as a trooper in the Imperial Yeomanry, and the employees of the firm have presented Mr. WATT with an address, demonstrating their appreciation of his patriotic conduct, and expressing their hope that when he has done his duty, he may be spared to return to this country in safety. Additional addresses have been presented to Mr. WATT by the representatives of the seed department and of the office.

SIR MICHAEL FOSTER, M.P.—The country may be congratulated on the election of Sir MICHAEL FOSTER as representative in parliament for the University of London. He is a typical representative for the most advanced and progressive of our universities, and, as a man of business, as well as for his scientific habits of thought, will be a valuable addition to the House.

MR. H. J. ELWES, F.R.S.—Much sympathy is felt for Mr. ELWES, of Andoversford, whose son has been seriously wounded in South Africa.

RHODODENDRON GRANDE.—Among the Himalayan species of *Rhododendron* of doubtful hardiness in this country, excepting in the western and south-western maritime counties, few finer white-flowered ones exist than *R. grande*. The plant possesses flowers 2 to 3 inches in length, and 2 to 2½ inches in diameter, having a very short calyx, obscurely lobed, and a corolla limb of somewhat short segments. It flowers in the month of March. The leaves are nearly flat, glabrous, and

announced that on the occasion of the forthcoming International Exhibition in Paris, an International Congress of Botany will be held there from October 1 to 10, both dates inclusive. The subscription for membership has been fixed at 20 f., and those who may be desirous of taking part in the proceedings are desired to communicate with M. HENRI HUA, Trésorier du Congrès International de Botanique Général, 2, Rue de Villersexel, Paris. Mr. GEORGE MASSEE, F.L.S., exhibited lantern-

they were both native plants, as the former is indigenous on the west coast of France, and on the north coast as far as Cherbourg and Barfleur, while the latter is a native of West France as far north as Vendée, and reappears on the coast of the Netherlands. He suggested that the former had been passed over, owing to its resemblance to *P. canariensis*; the latter owing to its inconspicuous habit, its early flowering, and the fact that it grows on the lower slopes of the cliffs in an unfrequented

FIG. 32.—RHODODENDRON GRANDE.

(From a photograph taken in the Gardens at Osberton Manor, Worksop.)

of deep green tint above and silvery beneath. It grows to a height of 30 feet in its native habitat. The species is figured in the *Botanical Magazine*, t. 5054, as *R. argenteum*. Our illustration (fig. 32) is after a photograph sent us by Mr. FOLJAMBE's late head gardener at Osberton Manor, Worksop, and shows a large plant in bloom standing in a glasshouse.

LINNEAN SOCIETY.—On the occasion of the meeting held on February 1, 1900, Dr. A. GÜNTHER, F.R.S., president, in the chair, the President

slides in illustration of his paper on the origin of the Basidiomycetes, the substance of which had been communicated at the last meeting, and recapitulated the conclusions at which he had arrived. A discussion followed, in which Professor TRAIL, Mr. C. B. CLARKE, and Professor FARMER took part. Mr. CECIL R. P. ANDREWS, M.A., exhibited two non-British Grasses which he had found last year in the Channel Islands—*Phalaris minor*, Retz., from sandy shores and fields in Guernsey and Alderney; and *Milium scabrum*, Merl., from the cliffs of Guernsey. He maintained that

part of the island. A discussion followed, in which Messrs. JAMES GROVES and G. C. DRUCK joined, and Mr. ANDREWS replied. Mr. R. MORTON MIDDLETON, F.L.S., showed divers forms of *Asplenium Bradleyi* from the mountains of Tennessee.

THE BANDED SCIRPUS.—When alluding to this plant last week, we unfortunately entirely overlooked a more definite and satisfactory communication to our own columns in 1883; vol. xx., p. 168, from the pen of Mr. GEORGE NICHOLSON. May he forgive our inadvertence.

HORTICULTURISTS ABOUT CROYDON, though possessing two societies which have concerned themselves only with holding exhibitions in the summer and autumn, have enjoyed no facilities for the mutual improvement of themselves by means of debate. A correspondent a few months ago called attention to this fact in our pages, and so another society has been formed in Croydon, and will be known as the Croydon and District Horticultural Mutual Improvement Society. Meetings will be held monthly, and the first is to take place in the Sunflower Coffee Tavern on Tuesday evening next, when a paper will be read by Mr. GEO. GORDON. Sixty members have been enrolled. Our correspondent who first drew attention to the subject has been elected President, and the Secretary is Mr. JOHN GREGORY, 60, Canterbury Road, Croydon.

CEDARS OF LEBANON.—"Close to the hall (West Wycombe) are two very large and beautiful Cedars of Lebanon, both of them being then (August) in cone. One is considerably older than the other, and the tint of the foliage is different. The girth of the largest tree at 5 ft. from the ground was found to be 71 inches (quarter girth), or nearly 24 ft., the largest Cedar ever seen by any arboriculturist present. At Houghton Hall, in Norfolk, the members had seen a Cedar, in 1897, with a girth of 17 feet 10 inches. Next year, at Edenhall, they saw two which measured 22 feet 8 inches, and 22 feet 4 inches respectively, and they then imagined that their surprises were at an end. But this unexpected giant upset all their preconceived notions as to the dimensions which a Cedar may attain in this country." *Transactions of English Arboricultural Society*, vol. iv., part ii.

WAS SHAKESPEARE AN EVOLUTIONIST?—Certainly he was, and also a Darwinian before DARWIN! A plant or animal is always in the course of its own development to repeat in some measure the appearances which its ancestors presented, and this knowledge enables the naturalist, to some extent, to forecast the course of phenomena in the future. Now see how Shakespeare puts it:—

"There is a history in all men's lives,
Figuring the nature of the times deceased;
The which observed, a man may prophecy,
With a near aim, of the main chance of things
As yet not come to life: which in their seeds,
And weak beginnings, lie intresured."
2 Henry IV., Act iii., sc. 1.

"HOME AND GARDEN."—We have already had occasion to notice the publication by Miss Jekyll of this companion-volume to *Wood and Garden*. That book was so fresh, contained so many valuable hints, and evinced such taste in garden matters, that it came as a new "break," to use a garden term, in garden literature. No wonder that its success prompted the issue of a second volume which, it is also not surprising, is only less good than its predecessor. In it we are told how the house was built, and then we are treated to a number of pleasant chapters on miscellaneous subjects, more or less relevant to the garden. The "Home Pusses" we venture to think should have been kept at home, their doings are amusing enough, but hardly consistent with the serious purpose of the book. The illustrations are excellent, and the book has a good index—need we say more to recommend it to the notice of our readers. It is published by LONGMANS & CO.

STOCK-TAKING: JANUARY.—Notwithstanding the war now raging in South Africa, and rumours or suggestions of fresh complications, the Trade and Navigation Returns for January read as if Trade and manufactures were moving along in the wake of peace; for under both headings of "imports" and "exports" there is a notable increase compared with the same period last year—emphasized, moreover, by the enormous tonnage taken up for Government transport service. As to imports, the increase for the month is £3,344,243; the value for last month being £44,560,849, against £41,216,606. Preparing for Budget purposes,

apparently, some items show a large increase; thus: Tea has gone up by 11,314,962 pounds; Cocoa by 2,442,942 pounds; Coffee, 2960 cwt.; wine, 96,031 gallons; and so forth. There is a fall of £1,336,317 in materials (raw) for textile manufactures, but a gain of £1,067,494 in raw materials for other industries and manufactures. The following are our usual excerpts from the summary table:—

IMPORTS.	1899.	1900.	Difference.
	£	£	£
Total value ...	41,216,606	44,560,849	+3,344,243
(A.) Articles of food and drink—duty free ...	14,211,831	14,581,453	+369,622
(B.) Articles of food & drink—dutiable	1,717,053	2,234,550	+517,497
Raw materials for textile manufactures ...	9,626,504	8,290,187	-1,336,317
Raw materials for sundry industries and manufactures	8,120,391	4,187,885	-3,932,506
(A.) Miscellaneous articles ...	1,170,841	1,464,095	+293,254
(B.) Parcel Post ...	156,372	145,690	-10,682

Respecting the new arrangement for recording imports of fruit, &c., a fresh feature has been introduced by the compiler of the Returns. For the future, these will be given in hundredweights instead of bushels; it thus necessitating for the present the use of value with which to ascertain "differences." The following are the figures for month of January in the two years:—

IMPORTS.	1899.	1900.	Difference.
	Bushels.	Cwt.	Value.
		£	£
Fruits, raw:—			
Apples ...	303,058	206,823	+16,286
Bananas... bunches	90,242	+37,752
Grapes ...	1,433	440	-92
Lemons ...	183,218	104,170	+2,386
Nuts—Almonds ...	6,815	10,950	+11,610
" others, used as fruit	37,703	+9,665
Oranges ..	1,244,265	914,465	+33,319
Pears ...	7,382	2,860	-555
Plums ...	77	20	-204
Unenumerated...	66,040	7,206	-24,017
Vegetables, raw:—			
Onions ... bush.	529,753	631,017	+7,599
Potatoes ... cwt.	50,976	275,192	+40,164
Tomatoes	37,496	+23,591
Vegetables, raw, unenumerated ... value	£109,905	£70,496	+39,409

It remains to note here, respecting the item "fruit unenumerated raw," that prior to this year it included Apricots and Peaches, Bananas, Currants, Gooseberries, and Strawberries. Passing now to—

EXPORTS,

we have to note the satisfactory and encouraging increase of £3,236,448, thus obtained, January, 1900, £23,583,682, as against £20,347,234 in January of last year. The making of ships for foreign customers has had to give way to home consumption, and all classes of iron manufactures have gone up wonderfully, and to all parts of the world; pig-iron goes just now to the United States. Coal has increased its export by nearly three-quarters of a million sterling; and textiles—cotton, linen, and woollen—show plenty of life. Though India does not come to the front so well as formerly for cotton goods, America purchased largely in all three of the textiles named above. To conclude, owing to fresh arrangements of details, Members of Parliament looking for the item "Confectionery," will no longer find it arrayed under "Pickles," but just where they ought to be found in a greatly improved statistical record.

EPHING FOREST.—The Epping Forest Committee of the Corporation, in recommending that £4000 should be placed to the credit of the fund for the year ensuing, report that the thinning operations, which have been continued for nearly twenty years, have resulted in a marked improvement to the timber and undergrowth, while the natural growth of young trees, the timber of the future, has been promoted. The most urgent arrears have now been overtaken, and a much smaller annual felling has been necessary during the last and present seasons. Very little planting has been needed except for the purpose of hiding fences or other unsightly enclosures abutting on the forest, and replacing trees destroyed by the drought. In this connexion the committee report that a very large number of fires occurred last summer in various parts of the forest, owing to the extraordinary heat and drought, but with one exception, no serious damage was done.

"ICONES SELECTÆ HORTI THENENSIS."

The second fascicle of illustrations of plants growing in the collections of M. VAN DEN BOSSCHE, at Tirlemont, has lately been issued. The illustrations are excellent for botanical purposes, and the text appropriate. Some of the plants are old friends, but no doubt as time goes on we shall have illustrations of less well known plants; in the meantime, we can heartily commend the work to those who desire to know something of the plants they cultivate.

THE ENGLISH ARBORICULTURAL SOCIETY has just issued a new part of its *Transactions* (SIMPKIN, MARSHALL & Co.). It contains a report of the annual excursion, when Osterley Park, near Hounslow, Syon, Kew, Richmond, were visited on one day! On the third day, the Beech-woods near Wycombe were visited, and the annual dinner took place in the evening. On the fourth day the members visited Windsor Castle and Windsor Forest, a long day's work, finishing up with a reception at the Surveyors' Institution. Next day Bushey Park, Hampton Court, and Oxshott were visited. It cannot be said that the arboriculturists did not work hard. The fault on most of these occasions is an overloaded programme.

LAWNS.—If there is one feature more than another in which English gardens are superior to those of the Continent, it is in the construction, and especially in the maintenance, of the lawn. Of late years tennis-lawns and "putting-greens" have also put forth strong claims to recognition, and the gardener is often called on to construct one or other of these adjuncts. During the season the gardener is constantly taking away and repressing growth by frequent mowing and rolling; he should, therefore, when occasion serves, refresh the soil exhausted by the continuous growth of a grass-crop, and stimulate the growth of the unhappy grass plants by a surface-dressing of manure, or by the use of well-selected artificial. As to weeds, anything which encourages the growth of the grass will, in proportion, be injurious to the weeds, so that the timely application of a mixed mineral and nitrogenous manure may save a great deal of trouble in extirpating weeds at a future time. Messrs. SUTTON have published, through SIMPKIN, MARSHALL & Co., a booklet on the subject of "garden-lawns, tennis-lawns," "putting-greens," and cricket grounds, as elegant as it is serviceable.

MEETING OF THE GHENT HORTICULTURAL SOCIETY.—At the meeting of the Chambre Syndicale des Horticulteurs Belges and of the Société Royale d'Agriculture et de Botanique held on February 5, the following awards were made:—Certificates of Merit for: *Odontoglossum Ruckerianum superbum*, and for *Lælia Gouldiana*, and for *Odontoglossum crispum grandiflorum* (par acclamation), and for *Cattleya Trianae bella* (à l'unanimité), all from M.G. VINCKE-DEJARDIN; for *Cattleya Trianae alba* (à l'unanimité), from M.J. BOELENS; *Ficus radicans variegata*, M. LOUIS DE SMET; *Odontoglossum Wilkeanum* "Mme. Dobbelaere," from MME. DOBBELAERE,

a Fern introduced from the Congo in 1899 from M. M. VERDONCK; cut Cyclamen (*par acclamation*), from M. DRAPS-DOM; and cut blooms of *Cypripedium* Mme. Stepman from M. STEPMAN. Certificates for cultivation and flowering were allotted for *Oncidium Gardneri*, from M. L. DE SMET-DUVIVIER; and for *Acacia platyptera* (*à l'unanimité*), from M. E. BEDINGHAUS. Certificates for Cultivation were allotted for *Cocos Weddelliana*, from M. DE CLERCQ; and for *Blechnum brasiliense* × *Lomaria gibba* (*à l'unanimité*), from M. L. DE SMET-DUVIVIER; and Honourable Mention was awarded for *Corypha australis Kerchovae*, from M. ED. PYNAERT VAN GEERT. The jury expressed the hope of seeing at a later exhibition, *Anthurium Scherzerianum* (hybrid), from M. L. DE SMET, and another hybrid *Anthurium* from the Ghent Horticultural Society.

FALSE IDEALS.—It is very pleasant to read Mr. LESLIE'S note on this subject in the *Garden* for January 27, pleasant because we believe it to be the truth, and satisfactory because it coincides so thoroughly with what we have often written in this journal. There are some flowers in which it almost seems as if the express object had been to crush out all the history of the flower and obliterate its significance. "So long," says the eminent Academician, "as we follow the lead which Nature, as it were, points out to us, we are on safe ground, for by assisting her in the way of her own direction, increase of beauty frequently rewards our labours. When a plant has a natural tendency to double its blossoms, or crosses easily by fertilisation, the results are nearly always interesting and satisfactory; but whenever she has distinctly marked out the character and purpose of a plant, and so fitted it that it shall do its best for the general effect in the place among its fellows which she intends it to occupy, it seems to me to be folly for the cultivator to interfere. By so doing, novelties and monstrosities may very likely be secured, but an increase of beauty—never." At the same time, it must not be forgotten that the conditions under which a wild plant, or a plant treated as wild, grow are different from those under cultivation, and that the requirements in the two cases are often widely different. We do not want to limit Nature's power of adaptation, but simply to direct it, so as to satisfy our own requirements, whatever they may be. To lay down a set of "properties," in so far as those properties are merely arbitrary, and to endeavour to act on them, is to allow intelligence and the perception of beauty to remain in abeyance.

ROYAL TREES.—In the vicinity of Frogmore there is a large number of ornamental trees scattered about the well-kept lawns. Amongst these are a *Salisburia adiantifolia*, planted by Princess Victoria Eugénie and Prince Maurice of Battenberg on the Queen's eightieth birthday; a deciduous Cypress, about 85 feet high; *Retinospora obtusa aurea*, planted by the Empress Eugénie, March 5, 1890; *Thuja Pattoniana*, planted by the Queen of Denmark on December 1, 1875, about 18 feet high; *Abies lasiocarpa* (concolor?), planted by Princess Thyra of Denmark on December 1, 1875; *Abies Nordmanniana*, planted by H.R.H. the Duchess of Edinburgh on March 11, 1874; *Cupressus Lambertiana*, planted by the Prince of Wales on March 24, 1864; *Thuja gigantea*, planted by H.R.H. Princess Louise of Hesse on July 1, 1864; another of the same kind, on the opposite side of the path, 55 feet high; another Maiden-hair Tree (*Salisburia adiantifolia*), planted in 1754; *Thuja gigantea*, planted by H.S.H. Princess Hohenlohe on March 16, 1857. Close to the mausoleum is a particularly good-looking deciduous Cypress, and a fine *Cedrus Deodara* and *C. atlantica*. *English Arboricultural Society Transactions*, vol. iv., part 2, p. 207.

SAPROLEGNIA.—This is a fungus not much known to horticulturists, excepting as attacking flies in autumn. The experiments of Professor KLEBS, however, on the influence of varying

amounts of food are so important that we call attention to a brief summary of them in the December number of the *Botanical Gazette* (Chicago). It is found that this species will grow indefinitely without either sexual or asexual reproduction, if nourishment be abundant; but at any time the extensive formation of zoospores can be incited by simply starving the hyphæ or threads of which the fungus consists, e.g., by placing them in water. By varying the nutritive value of any medium, the fungus can be made at will to assume a purely vegetative condition; to produce rudimentary sporangia; to form sporangia which bear zoospores that do not escape, and to produce functional zoospores. It is obvious that the principles here laid down have a wide application, and they show that in certain cases the production of male or female plants, or of purely vegetative conditions, is within the power of the experimenter.

THE WEATHER OF JANUARY, 1900.

FOR the third time in succession the opening month of the year was chiefly remarkable for an almost complete absence of real winter weather. At its commencement, the extraordinary low pressure of the last few days of December was followed by some exceedingly heavy rainfalls, the total of the first week over the south-west of our islands equalling or exceeding the whole of the fall of the remainder of the month, although the weather continued throughout the month of a changeable, wet, and disagreeable character.

In many districts there was a complete absence of frost during the month, but there were many frosty nights over our central, north-eastern, and eastern counties, although none of any severity. On the 28th, however, the wind (after with slight exception blowing for a month from a direction varying from west to south) became northerly, and a decided fall of temperature set in, and by the close of the month conditions had become most favourable for a spell of cold weather, although in the south-west the temperature still remained several degrees above freezing-point.

Taking the month as a whole, it shows in many respects over the greater part of our islands a striking resemblance to the opening month of last year. In both heavy rainfall was general, accompanied by mild weather until the last week, when a spell of cold spread over our islands. Last year, however, mean temperature was deficient in the north owing to some severe frost during the last week.

The following table will show the rainfall and mean temperature at ten stations well distributed over our islands:—

Stations.	Total Rainfall.	Difference from Average.	Mean Temperature, Max. and Min.	Departure from Average.	Hours of Bright Sunshine.
Aberdeen ...	Ins. 3.45	+1.07	Deg. 38.5	+1.1	53.4
Leith ...	2.35	+0.57	40.3	+1.7	—
Spurn Head ...	2.44	+1.06	39.8	+2.2	—
Liverpool ...	4.50	+2.32	40.4	+1.5	—
Valencia ...	5.03	—1.28	44.8	+0.4	60.1
Scilly ...	6.42	+2.79	47.9	+2.5	61.2
Jersey ...	4.88	+1.07	45.7	+3.9	—
Bristol ...	4.54	+1.43	41.2	+2.0	—
Oxford ...	2.30	+0.14	40.1	+2.4	—
London ...	2.35	+0.29	40.3	+2.0	23.1

It will be seen, therefore, that rainfall, excepting at Valencia, was everywhere in excess. The great excess at Scilly was chiefly due to an extraordinary fall of 2.75 inches, on the 6th. Other falls reported of over an inch or more in twenty-four hours were:—1.37 inch at Parsonstown, and 1.05 inch at Roche's Point, on the 1st; 1.10 inch at Aberdeen, and 1.03 inch at Bristol, on the 2nd; 1.27 inch at Valencia, on the 5th; and 1.25 inch at

Loughborough, and 1.45 inch at Liverpool, on the 6th.

Mean atmospheric pressure was generally below the average. During the greater part of the month the barometer was lowest over the north of our islands, but during the last week an anti-cyclone formed over Scandinavia, and pressure became lowest over our northern districts. The greatest pressure reported at 8 A.M. was 30.48 inches at several south-western stations, on the 11th; and the least, 28.96 inches at Stornoway, on the 15th.

Temperature over our islands ranged from a maximum of 55° at Aberdeen on the 22nd, to a minimum of 24° at Loughborough on the 21st. Similar minima were also reported from Parsonstown on the 5th, and Nairn on the 28th.

Thunderstorms occurred on the 17th at Roche's Point, on the 20th at Stornoway, and on the 27th at Jersey; while lightning was reported from Wick and Aberdeen on the 9th, from Nairn and the north-west of Ireland on the 27th, and from Scilly on the 28th. Snow fell in the north of Scotland on the 4th, 5th, and 9th, and in many places during the last few days, but there were no serious storms. Aurora was reported from many stations in the north on the 19th.

Although no violent gales occurred, moderate ones were frequent throughout the month. The most extensive reported were from the south over the English Channel, and from the north-east in Scotland on the 3rd; from the south, on our northern and western coasts, on the 6th; from the south-west, in the west and north, on the 19th; and from the south-west to north-west, over the northern districts, from the 21st to the 24th. *H. H. Harding, F.R.Met.Soc.*

THE CULTURE OF KALOSANTHES.

I FEAR in the race for new plants, the older, but in my opinion, equally beautiful *Kalosanthès*, are at the present day getting overlooked, although their management is not difficult or their value as decorative plants of an inferior kind. The genus *Kalosanthès* is now placed with *Crassula* and *Roehea*, and doubtless those who like the *Crassulas* will not fail to grow the *Kalosanthès*, of which *K. coccinea* is one of the best, and *K. jasminæ* (*Crassula jasminæ*) is a very pretty cool greenhouse plant, much favoured by market growers. The flowers, resembling those of *Jasminum officinale*, are white at the first and become pink later on. Another well known variety is *K. odoratissima*, a plant having fragrant, creamy-white flowers, which is less showy than *K. coccinea*, but still worthy of cultivation; there are others, such as *K. varicolor*, a plant of less decorative value than any of those previously named. For many years past *Kalosanthès coccinea* and *K. jasminæ* have been grown in large quantities near the metropolis for the markets, but of late years I have noticed these are less grown; and this is also true of private gardens. In the latter large specimens used to be found, but they are now very rare. The chief value of these species is as yearling or two-year-old plants, small plants producing a proportionately large amount of flowers; moreover, they can be employed for a great variety of purposes. Large specimens have their uses for the decoration of the conservatory and greenhouse from April to August. As regards their culture, it may not be out of place to note that if small plants—say, in 4-inch or 6-inch pots—are desired, the plants are kept in a growing state, not dried off like plants of two, three, and four years old; the strongest shoots are removed from the plants, and those which have not flowered are removed at 5 to 6 inches in length, being denuded of leaves, and the cuttings are then placed singly in small pots in very sandy soil, made firm, and water sparingly afforded till roots have pushed forth. Whilst still unrooted the cuttings should be shaded and kept close under a cold frame or hand-glass.

Cuttings taken in the summer strike freely if

the plants from which they are taken are previously kept rather dry for a few days. Where this cannot be done, cuttings may be removed from a plant in bloom, and be dried for some hours in a shady house or frame before inserting them in the cutting-pots. They strike best when placed round the sides of a smallish flower-pot. When rooted, let the cuttings be potted singly in large 60's, and repot them for flowering into 5-inch pots. There is a gain in point of time by striking the cuttings singly in small pots, but great care must be exercised in the first stages in affording water, and the preparation of the cuttings. The after treatment is simple. At the first potting, a light soil should be employed, such as leaf-mould and peat, and finely-sifted mortar-rubble for older plants; but young plants like sand in the soil, and soon go ahead. From the month of October to the end of March following, the plants need but a very small quantity of water at the root, but they should occupy a light place—say, the back wall of a vinery or greenhouse, away from damp surroundings. The complete drying off of small plants is not advisable, as in their case growth should not entirely cease during the winter. Cuttings should be struck as early in the summer months as possible if plants are wanted for next season's flowering, and the plants got into their flowering pots before the autumn arrives.

Some gardeners allow two years to elapse before destroying the plants. Under this method, shoots that have flowered are cut, and the others tied-in to make symmetrical plants. The plants should then (early summer) be partially shaken out, repotted, placed in cold frames in the full sun, and kept close for a short time, syringing and shading them till new roots are made. Another method is to propagate strong shoots, taken from plants not showing flower, doing this early in the spring, growing the plants on during the summer, first in frames, and then in the open, till the end of September, then housing the plants, and beginning to feed in April for summer bloom. *K. jasminae* is the earliest species to flower, and this is often grown for May flowering; coccinea and versicolor or odoratissima for succession. These make excellent house plants, and if they are grown as advised, they need but little support from stakes, excepting when of large size. I would advise as soon as they have done flowering, to partially cut back the old growth, leaving any young growth at the base to dry off for two or three weeks, standing the plants on a hard coal-ash bottom in the full sun, then, when new growth appears, to partially shake out and repot in sandy compost, lowering the plants as much as possible, and to grow in frames, as advised for younger plants. *G. Wythes*.

NURSERY NOTES.

MESSRS. HUGH LOW & CO.

ORCHIDS certainly have the advantage over many other classes of plants, that the different members of the family produce a continuous selection of flowers all the year round, and the advantage is the more evident at the present dull season when little else than Orchids is to be found in bloom. At the present time, in the Bush Hill Park Nurseries of Messrs. Hugh Low & Co., a very fine display of *Phalenopsis*, a large number of their superb form of *Dendrobium Wardianum*, some splendid varieties of *D. crassinode*, and other species, are making a fine show.

The very large and healthy collection of the showy *Cattleyas* are profusely set with flowering-sheaths, some thousands of *C. Mendeli*, *C. Mossiae*, and *C. Schroderae*, as yet unflowered, being looked forward to with interest. Among those in flower is the pretty *Cattleya Trianae plumosa*, a perfectly-shaped bloom, with distinct purple feather on the petals; a very large specimen of *C. Trianae alba*, with many buds; and other fine-named varieties.

The *Cypripediums* are in great quantity and fine health. The immense quantity of *C. Lawrenceanum*

(out of which one fine example of *C. Lawrenceanum* Hyeaunum had been parted with among common *C. Lawrenceanum*), is now being watched for similar good fortune. One strong plant of the true *C. L. Hyeaunum* is present, and also the worthless form of it known as *C. L. Hyeaunum Gratrix's* variety. Among others in bloom is a small lot of *C. niveum*, now getting scarce; some good *C. bellatulum*, the best form of *C. x Arthurianum pulchellum*, *C. x Hera*, the fine *C. x Niobe superbum*, *C. Rothschildianum*, *C. x Leeaunum* in great variety, including *C. x L. giganteum*, and the distinct *C. x L. Clinkaberryanum*; *C. x Henry Graves*, *C. x Bruno*, *C. x Minnie Ames*, the handsome *C. x J. Howes*, a new and pretty hybrid between *C. Charlesworthi* and *C. callosum*, *C. x Madame Georges Truffaut*, a grand specimen of *C. caudatum Wallisii*, with several strong spikes; *C. x calurum*, and a fine, nearly white form of it; and the handsome *C. x Minoes (Spicerianum x Arthurianum)*, which is certainly one of the most beautiful of its class.

In the many ranges of *Odontoglossums*, the large quantity of plants of *O. Pescatorei* are specially remarkable for their vigour and the profusion of flower-spikes they are sending up. The *O. crispum*, too, are about to flower well, and already some are in flower, and with them a few hybrids; one noble form of *O. x Wilkeanum*, a large yellow flower, but with dark red-brown blotches, being very remarkable.

Among the *Lælia* aneeps in bloom are two fine whites, with a very faint tint of pink on the lip, which are in size and form like *L. a. Schroderiana*; also the true *L. a. Hilli*, and other named varieties.

Other good batches remarked in flower or bud were a fine type of *Dendrobium Fytchianum*, the elegant *D. Madonna*, of which the typical and the pure white forms were in bloom; *Cymbidium Lowianum*, and its yellow variety concolor; *C. Tracayanum*, the scarlet *Sophrontis grandiflora*, *Lælia harpophylla*, *Oncidium splendidum*; and among a number of other hybrid *Dendrobiums* the chaste, pearly-white *D. x melanodiscus Luna*; the richly coloured *D. x splendidissimum* Low's variety, &c.

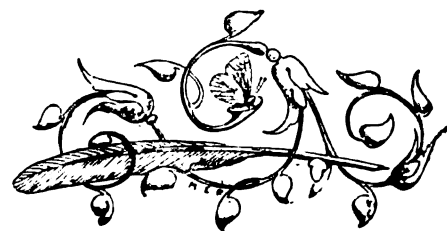

Other plants noted were the fringed-lipped *Brassavola cuspidata*, a fine lot of *Cynoches chlorocylon*, *Catasetum callosum*, *Dendrobium Findlayianum*, a good lot of *Epidendrum vitellinum*, a profusely-flowered batch of *Angraecum atratum*, and an interesting lot of hybrid *Lælias*, *Cattleyas*, and *Lælio-Cattleyas*.

ARCHONTOPHÆNIX CUNNING-HAMI.

THIS handsome species of Palm, better known in gardens as *Seaforthia elegans*, is a native of Queensland and New South Wales, where it reaches a height of 60 feet. In this country it is usually grown in the cool greenhouse or the conservatory.

In subtropical lands the species forms a decorative object of much value in the garden; and as indicating this fact, we afford our readers an illustration (fig. 33, p. 109), one of several photographs sent us, of a specimen growing in Mr. W. P. Gould's garden, El Montecito, California. Mr. John M. Pear, the gardener, states that the Palm is about twelve years old. The figure shows two expanded inflorescences, and the leaf as it fell at that time. We are told that in the same garden there exists a *Cocos plumosa* of the same age as the figured Palm, which has reached a height of about 50 feet.

PUBLICATIONS RECEIVED.—*The Naturalists' Directory*, for the use of Students of Natural History and Collectors of Zoological, Botanical, or Geological Specimens, giving the names and addresses of British and foreign naturalists, natural history agents, societies and field clubs, museums, magazines, &c. (L. Upcott Gill, 170, Strand, W.C.).—*The Century Book of Gardening* (Geo. Newnes, Ltd., Southampton Street, W.C.), Parts 22 and 23.

HOME CORRESPONDENCE.

INFLUENCE OF THE STOCK UPON THE GRAFT OF THE RIBSTON PIPPIN APPLE.—When I read the paragraph in the issue of the *Gardeners' Chronicle* for Feb. 3, p. 77, I thought with sorrow that the writer's memory was failing him, or he would have remembered how I thrashed out this matter in 1869-70. Well, in 1848 I came to Woodstock, Oxfordshire, to live, and in the old rectory garden there was a Ribston Pippin Apple-tree in a bad state with canker, and near to it grew a tree of Blenheim Orange Pippin, old, but vigorous. I will mention this excellent Apple, as it will have intimately to do with what I am about to describe. It was raised by a shoemaker, Demster by name, of Old Woodstock. I saw the original tree soon after I came to reside at New Woodstock, and took a couple of miserable-looking scions from it, which I grafted on to a Crab stock, one of which "took," and I have the tree now growing in my orchard. One Grimmet, a famous basket-maker, lived there then, and a flourishing young tree was growing by the side of the older original tree, which Grimmet threatened to cut down as "being no good on," and because it stood in the way of the young tree. It occurred to me not long after hearing of this threat that I should like a bit of the wood to retain as a memento; but I was too late. Grimmet had cut down the tree and burnt it. It is just possible that I am the only person who can trace a direct descendant from the old Demster-tree, as myriads of trees, which had originated from the old stock, doubtless, were growing around in pristine vigour; interspersed amongst them being my then favourite. It also occurred to me that it might be possible to infuse new vigour and strength into the stunted and unhealthy Ribston Pippin tree, and with this view I sowed some pipe of the Blenheim Orange Pippin, as being most likely, from the healthy and vigorous character of the variety, to produce a stock that would bring about a change for the better, and prove whether fresh and vigorous sap from a young and free-growing stock would eradicate the almost universal destructive canker in the bark, and, as a consequence add fresh life to the tree. In the second year, I selected the strongest seedlings of the batch of Blenheim Orange Pippins, one of which had a forked stem, and this stock I whip-grafted with two weakly scions from the diseased stunted specimens, both of which, to my astonishment, grew, and by the following year they had made a strong growth. The young tree was then taken up, and planted against a wall. I then determined to carry my experiment further by removing one of the grafts just above its union with the stock; and in order to do this, I removed with my budding-knife about 2 inches of the bark all round, and quite down to the wood, by this means causing the formation of a callus. Further, I tied moss round the limb, keeping it moist; then bent it down, and pegged it horizontally upon the earth, which I covered with moss, which was kept constantly moist during the summer and autumn. The limb which was thus ringed, rooted into the moss and soil readily; and in the following November, I severed the limb or graft from the stock and planted it in a pot, where it continued to make good clean growths, though of not nearly so vigorous a character as its fellow which was left undisturbed against the wall. After several shiftings into larger pots, I likewise planted that one out. The tree against the wall was the first to produce fruit, the branches remained clean and free from canker; the foliage was fully developed, partaking very much of the character of the Demster, whilst the fruit bore a striking resemblance to that of the Ribston. In texture of flesh, the fruit was not so solid, and unfortunately it was of not so good a flavour—a combination of Blenheim and Ribston, but one of the best of autumn Apples for culinary uses. I had to wait for some

years for fruits upon my tree that I revered. At length fruits from each of them were sent to the Royal Horticultural Society's Fruit Committee in 1869, raw and also cooked. I was a member of the Royal Horticultural Society's Fruit Committee then, and so, being a member, I had to move away from the table whilst my productions were receiving judgment. Upon my recall, Mr. Barron said my "Apples were a step, in regard to flavour as com-

I can scarcely keep them alive, they have so completely gone back to the decrepit cankered state of the Ribston Pippin-tree. *Robt. Fenn, Sulhamstead, February 5, 1900.*

SWEET PEAS.—I was pleased to read the able article on Sweet Peas in a recent *Gardeners' Chronicle*, and I fully endorse the writer's advice to lovers of this now popular flowering-plant. Very

On such land it is almost impossible to afford too much water, particularly if the summer is like the last. By sowing in trenches, the mulching materials are not washed away, and water is more readily carried out. Syringing, copiously carried out in the evenings after hot days, benefits the plants greatly, and keeps thrips in check. Owing to lack of space, I can only find room to grow the following varieties, which, however, give a good range of colour:—*Blanche Burpees* (white), *Lady Nina Balfour* (mauve), *Mrs. Eckford* (pale yellow), *Salopian* (crimson), *Shahzada* (purple), *Countess of Powis* (orange-pink), *Princess of Wales* (striped-blue), *Emily Eckford* (blue), and *Aurora* (striped-pink). *T. H. B., Kingston Hill.*

GARDENING FOR INEBRIATES.—Until to-day I overlooked a paragraph in your issue of January 20. It is headed "Flowers and Frailty," and relates to the good effect on the female inmates of the Home of Correction of making them work in greenhouses erected for the purpose. You think this might be tried in England with advantage. Apparently, you are not aware that for several years past one most successful mode of treatment with the Home for Inebriate Women, Duxhurst, Reigate, is to employ them in gardening. This is done under the active personal superintendence of Miss Jessie Smith, one of the first two women students who took the Diploma of the Horticultural College, Swanley. *E. L. Chamberlain.*

THE QUINCE IN SUSSEX.—Referring to Dr. Bonavia's letter in your issue of last week, there is or was a large factory at Rye (Sussex) for making Quinces into marmalade, and for several years I laid in supplies of the preserve from this factory. Whether they also make the Quince into confectionery I am not aware, but I entirely agree with the Doctor, that it is a pity such a delicious sweetmeat as cotognata does not appear to be obtainable here. I have had it sent to me from Portugal as a present, but my efforts to ascertain where I could purchase some have failed. Could Dr. Bonavia kindly favour your readers with the address of any factory or retailer in Italy or elsewhere, where one could obtain it? *C. A. C., Arundel.*

CANNA AUSTRIA.—I should be glad to know if any reader of the *Gardeners' Chronicle* has been able to flower the *Canna Austria*; and if so, under what treatment? I have tried for the last two years, but without success. I may add that other Cannas, including *Canna Italia*, have done well with me, and flowered profusely. *S. W., Kent.*

A TRIAL OF EARLY DAFFODILS AT ARD CAIRN, CORK.—Early in November, I stated in the *Gardeners' Chronicle* that I was arranging a trial at Ard Cairn of early Daffodils. All the varieties were potted on November 1, and below is given a list of the varieties, and the date when each first flowered: *Early Bird*, Jan. 15; *pallidus præcox*, Jan. 18; *obvallaris*, Jan. 20; *Cervantes* and *John Bright*, Jan. 21; *Golden Spur* and *Saragoosa*, Jan. 23; *Ard Righ*, Jan. 24; *Henry Irving*, Jan. 25; *Golden Eagle*, Jan. 26; *Buttercup*, Jan. 27; *Countess of Annealey* and *princeps maximus*, Jan. 28; *Telamonius plenus*, Jan. 29; *maximus* (wild form), Jan. 30; *Tuscan Bound* and *King Umberto*, Feb. 1; *Irish cernuus*, *spurius*, and *Mina Troil*, Feb. 2; *Golden Plover*, Feb. 3; *Tuscan bicolor* and *Tottenham Yellow*, Feb. 5. Other cultivators in this locality who potted *Early Bird* on October 1, obtained blooms on December 15. The flowers are compact and pretty, and when the variety is plentiful it will be most popular with market-growers, being the first to bloom. *Wm. Baylor Hartland, Ard Cairn, Cork.*

FRUIT TREES.—The planting of fruit trees is in many gardens still to be done, and when the trees come to hand with signs of having been for a long time out of the soil, I have always found that to soak the roots, and indeed the entire trees, in water for a few hours before laying in or planting, was a great help towards recovery. The omission of this practice is a cause of many a failure with trees that were quite sound when despatched from the nursery. As soon as, or before being planted, it is prudent to cut back gross shoots which exist about the middle of the head, as these, if left untouched, serve to weaken the smaller and less vigorous ones, especially those near the ground. At one time I tried the extension plan with Peach-trees, that is, the strong shoots were laid in at full

FIG. 33.—ARCHONTOPHENIX CUNNINGHAMII, GROWING IN MR. W. P. GOULD'S GARDEN, EL MONTECITO, CALIFORNIA. (SEE P. 108)

pared with the Ribston Pippin, in the wrong direction," viz., "a step backward." I came to London a day before the committee sat, and stayed in Upper Wimpole Street, where I knew of an excellent cook, in order to have a pie made to appear fresh on the morning of the meeting. I forgot to forbid flavouring. The judgment ran: "The committee considered it to be an excellent pie, but the natural flavour of the Apples was completely disguised by Cloves and sugar!" When I came here I brought those experimental Apple-trees with me.

little advantage is gained by sowing very early in the open ground, as until the soil becomes warmed by the sun, the seeds do not vegetate, and they are liable to rot if cold, wet weather should set in. Those who have the convenience would do well to sow a few dozen pots of varieties, and follow the advice given by "E.M.," and they will have sturdy plants for planting in the open when favourable weather occurs in April. I find it necessary here to sow in shallow trenches, the soil of the garden being of a poor, light nature, over-lying the gravel.

length, but this seemed always to result in failure, the lower buds on the shoots not forming shoots, hence the trees were lacking in symmetry. *H. Markham.*

A FRUITFUL POT-TREE OF PEACH CRIMSON GALANDE.—In 1898 the late Dr. Lewis, of Broomfields, Henfield, had a tree of this variety about fifteen years old, which carried a crop of about 200 fruits. In 1899 I had the tree photographed, and the same afternoon I picked 205 Peaches and sent them to Covent Garden Market, and the next day (July 3) they realised in the market, according to the salesman's return, a little over 6d. each, or a sum of £5 4s. 3d. I have other trees of different varieties which bear just as well, and all of them are in pots. In about a fortnight from to-day, February 12, they will present a blaze of bloom. The tree of Crimson Galande looks likely to carry 200 fruits this season. *James Terry, Henfield.*

THE WEATHER IN NORTH WARWICKSHIRE.—We are having exceptionally severe weather in this part of Warwickshire. For many days in November, December, and January we were visited by dense fogs. On December 13 I registered 24° of frost; February 8, 24°; February 9, 22°; February 10, 10°; February 11, 2°; and February 12, 11°. Our altitude is 380 feet above sea-level. During the above-named period we had much snow. On Saturday and Sunday last snow fell, accompanied by a strong north wind. On Sunday last, whilst the wind was at its height, we had a visit from some hundreds of fieldfares, who took shelter on the ground and in the shrubs in the garden. The trees were observed to be quite a fluttering mass of these birds, all busy feeding on the plentiful Hollyberries. An examination of the shrubs this morning showed that not a berry was left on them. During these storms I have observed the Gold-crested wren—*Regulus cristatus*—busily searching for insects amongst my young Fir-trees. Although we have no very thick woods near, I am told the Goldcrest may be seen in goodly numbers. To make up for the lack of thick woods, the district is liberally besprinkled with isolated trees, and these, together with immense quantities of uncut hedgerows, form ample nesting-covert for all sorts of native birds—and also of the migratory ones, too, during the season of their visitation and nidification. *W. Miller, Berkswell.*

CONTINUOUS FLOWERING OF PANCRA TIUMS.—My *Pancratium*s have been flowering continuously for three years, or 1095 consecutive days, missing only one day, viz., November 30 last year, and to all appearances they will go on for a long time to come. I do not think that it has ever been known for *Pancratium*s to flower so freely and continuously as mine have done; no blooms being kept on the plants from day to day, but the plants cleared each morning. The plants do not seem to be weakened in the least by continuous flowering. *Henry Porter, Freshfield, Liverpool.*

SOCIETIES.

ROYAL HORTICULTURAL.

FEBRUARY 13.—A meeting of the committees of the Royal Horticultural Society was held on Tuesday last in the Drill Hall, James Street, Westminster, and on the same day in the Society's offices, in Victoria Street, took place the annual general meeting of Fellows. Generally, and especially was this the case last year, on the occasion of the annual general meeting, there is a large exhibition made in the Drill Hall, and the attendance of Fellows is above the average. On Tuesday last the weather prevented many exhibitors from coming, and in consequence the display, though better than we have seen since Christmas, was not an extensive one. The roadways in the suburbs were so slippery that vehicular traffic had been seriously inconvenienced, and during the night preceding the meeting the frost was very severe, 19° being registered in Kent, and 22° in Hampshire. The risk attending the exhibition of delicate plants in such weather is obvious.

Orchids suffered most probably from the weather, there being many fewer on this occasion than have been shown at recent meetings. This Committee recommended a First-class Certificate to *Odontoglossum crispum* Mundyannum, from NORMAN C. COOKSON, Esq.; and *Laelio-Cattleya Bertha Fournier*, from M. CH. MARON; and Botanical Certificates to *Zygopetalum Murrayanum*, from Mr. F. W. MOORE, Glasnevin Botanic Gardens; and to *Dendrobium macrophyllum*, from C. J. LUCAS, Esq.

No awards other than medals were made by the Floral

Committee, but there were magnificent groups of *Primulas*, *Cyclamens*, and *Clematis indivisa*.

The Fruit and Vegetable Committee recommended an Award of Merit to a variety of *Rhubarb* named *Daw's Champion*. Collections of one hundred dishes of Apples were shown by Messrs. GEO. BUNYARD & CO., Maidstone; and Mr. JNO. WATKINS, Pomona Farm, Hereford.

Floral Committee.

Present: Chas. E. Shea, Esq., in the Chair; and Messrs. C. T. Drury, H. B. May, D. Dean, Jas. Hudson, J. Jennings, Robt. Fife, C. R. Fielder, J. Fraser, W. Bain, Chas. Jeffries, Herbert J. Cutbush, J. W. Pawle, G. Reuthe, E. H. Jenkins, W. J. James, E. T. Cook, H. Turner, C. Blick, H. J. Jones, Ed. Mawley, J. F. McLeod, and W. Howe.

Mr. Marshall, Chairman of this Committee, was confined to his house, owing to indisposition.

Messrs. JOHN LAING & SONS, Forest Hill Nurseries, London, S.E., staged a group of miscellaneous plants, amongst which were noticed *Azalea indica* in bloom, *Oytia racemosa*, *Styphylea colchica*, *Erica*, &c.; also pretty *Palms*, *Codiaeums*, *Ferns*, *Cordylines*, and other decorative species (*Silver Banksian* Medal).

Cyclamens were finely shown by Mr. JOHN MAY, Gordon Nursery, St. Margarets, Twickenham. He had a large group of plants in 5-inch pots, all of the plants carrying extra-sized blooms of much substance. The colours were exceptionally bright, and included a great variety of tints. A capital strain (*Silver Flora* Medal).

Messrs. H. CANNELL & SONS, Swanley, had a display of Chinese *Primulas*, that more than furnished one side of a long table. All of the plants represented varieties of the "lady" or "star" section, and a very beautiful effect they produced. Every plant bore an abundance of flowers, being a pyramid of blooms generally a foot high, and the free habit of the strain is just the quality most admirable in a plant needed for decorative effect. Most of the varieties have dark coloured petals, and are more pleasing than others that have lost this characteristic through repeated crossings with the florists' *Primula*. The varieties included Mrs. R. W. Cannell, white, with yellow eye, dark petioles and foliage; Princess Eva, white, some of the flowers showing pale bluish, petioles and foliage nearly green; Queen of Roses, a very charming variety; Mrs. H. Cannell, white; Miss Irene, salmon-pink, foliage moderately dark in colour, a splendid advance upon "Pink Lady"; Fairy Queen, white, or pale bluish; Purple Star, and Lady Emily Dyke, white (*Silver Flora* Medal).

Mr. WILLIAM BULL, 536, King's Road, Chelsea, London, sent blooms of varieties of Chinese *Primulas*, similar to those remarked upon on p. 73.

Blooms and foliage of *Primulas* were contributed also by Col. PLATT, C.B., Coddinog, Llanfairfechan (gr., Mr. W. Coates). The varieties were all good ones, and included Cannell's Pink, Improved Holborn Blue, Princess May, Lady Sarah Wilson (pure white, with yellow eye), and Red-stem Queen.

Four well-grown plants of *Astilbe astilboides* were shown by Messrs. VAN WAVEREN & KUYFF, Sassenheim, Haarlem, Holland. Each was given a varietal name, but though the plants were excellent representatives of the species, we could not discover important variations between them.

Messrs. F. SANDER & CO., St. Albans, showed blooms of three varieties of *Camellia*. They were Lady Buller, a single flower of magnificent deep rose colour; Lady White, white, variously marked with scarlet; and Lady Roberts, semi-double, soft rose, with white margins to the petals.

From Sir T. LAWRENCE, Bart., Burford, Dorset (gr., Mr. Bain), were shown two excellent double-flowered varieties of *Begonia semperflorens*. *Boule de Neige* is a most effective plant, the flowers open deep crimson and pass to rose. *Triomphe de Lorraine* is white. They are both very beautiful.

The pretty little *Iris*s, *I. Bakeriana*, figured in *Gardeners' Chronicle*, March 8, 1890, p. 293, and *I. Danfordiae*, were shown in flower in pots by Messrs. WALLACE & CO., Kilnfield Gardens, Colchester.

Messrs. BARR & SONS, King Street, Covent Garden, exhibited a few hardy flowering plants in pots; such as *Narcissus minimus* and others, *Cyclamen sibiricum rubrum* and roseum. Also *Primula obconica grandiflora* in several shades, and a variety of *P. sinensis*, with small flowers of a charming rose colour, and named *Rose Beauty*.

Clematis indivisa is a capital plant to flower in the greenhouse early in the year without being forced. When given suitable conditions it flowers with prodigal freedom, and its blossoms are exceedingly pretty. For training up pillars or on rafters, a more profitable plant could hardly be selected. Messrs. W. PAUL & SON, Waltham Cross, Herts, exhibited about sixty plants of *C. indivisa*, and *C. I. lobata*. Though these were worked but about ten months ago, and were in 4-inch pots only, many of them bore more than three score flowers, pure white, with yellow stamens, and purple anthers. The plants were worked about April, and when they had made growth a few inches long, were placed in the open, completing their growth there. This is the best practice to adopt in the case of plants in pots, it being easier to keep them clean by such treatment. Mildew is the worst enemy to the plant (*Silver Flora* Medal).

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair; and Messrs. J. O'Brien (Hon. Sec.), C. Maron (of Brunoy, France), de B. Crawshay, R. Brooman-White, H. A. Tracy, H. Little, J. T. Gabriel, H. J. Chapman, J. Wilson Potter, F. J. Thorne, E. Hill, H. T. Pitt, W. H. Young, T. W. Bond, C. Winn, and W. Cobb.

The weather being cold, the show of Orchids was small, and the greater part of the exhibits consisted of cut-flower spikes.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray), showed two noble blotched *Odontoglossum crispum*, viz., *O. crispum* Cooksoni, with a massive pure white flower, the sepals bearing dark purplish-brown blotches, and the petals similar, but with smaller spots, the same colour also marking the lip. The flower was 4 inches across. The sepals were 1 inch wide, and the petals 1½ inch. It had previously had a First-class Certificate. The other, *O. c. Mundyannum*, equalled it in size and beauty (see Awards). Mr. Cookson also showed spikes of the pure white *Calanthe* × *Sibyl*, and the delicate rose-coloured *C. × Phoebe*, as well as three forms of hybrid *Phalo-Calanthas*, varying in colour from bluish-white to purplish-rose.

M. CHAS. MARON, Brunoy, France, braved the bad weather, and brought over *Laelio-Cattleya* × *Bertha Fournier*, var. *splendida*, one of the largest and most gorgeously-tinted hybrids yet shown; also *Laelio-Cattleya* × *Ernesti pallida* (*Laelia flava* × *C. Percivaliana*), a paler form of the beautiful yellow hybrid previously shown by him, and which passed into Mr. Norman Cookson's collection. The flowers were of a soft cowlip-yellow with chocolate-purple markings in the centre of the lip.

Captain HORROD, Westonbirt, Tetbury (gr., Mr. A. Chapman), sent *Cattleya Trianae*, Westonbirt variety, a perfectly-shaped flower, of a light lilac-rose tint, the front of the lip being of an intense crimson-purple; also flowers of *Cypripedium* × *Calypso*, Oakwood variety, and *C. × Calypso*, Westonbirt var., both very handsome; *C. × Cyria*, and *C. × Mons. de Curte*, resembling a fine form of *C. × nitens*.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr., Mr. Davis), sent *Cattleya* × *Miranda* (amethystoglossa × *Trianae*), a very pretty hybrid with pink flowers, having the segments marked with rose-purple; *Cattleya Trianae*, Glebelands var., fine in shape, and with a very richly-coloured lip; *Cypripedium* × *Woodfordiense* (Beechense × *Charlesworthii*), of the same general appearance of others of the *Charlesworthii* crosses; and *C. × Chamber-Leanum*.

WALTER COBB, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), showed as *Cypripedium* × *Basano* (insigne × *i. Chantini*) a showy *Cypripedium*, apparently a good *C. × nitens*. If the reputed parentage be correct it would still be *C. insignis*. Mr. Cobb also showed fine spikes of *Laelia anceps Stella* and *L. a. Sunderiana*.

Messrs. LINDEN, l'Horticulture Coloniale, Brussels, sent *Odontoglossum* × *Ruckerianum* rubiginosum, a showy and singular form, with much resemblance to *O. × mulus*. Flowers yellow, profusely marked with red. Also *O. crispum* Goliath, a fine white flower, with a tinge of pink; and *Cypripedium* × *Schusterianum* (villosum × *Hookerianum* Volanteum). The large glossy flower had the colour of *C. villosum* aureum but was rounder in the labellum, and with a larger dorsal sepal.

C. J. LUCAS, Esq., Warnham Court, Horsham (gr., Mr. Duncan), sent *Cypripedium Lathamianum* Warnham Court variety, and *Dendrobium macrophyllum* Richardi.

Messrs. HEATH & SON, Cheltenham, showed a fine pan of the pretty white *Dendrobium barbatulum*, *Cypripedium* × *Lathamianum* giganteum, and a curious form of *C. insignis*.

FRANK A. REHDER, Esq., The Avenue, Gipsy Hill (gr., Mr. Norris), showed *Cypripedium* × *Favager* (*Charlesworthii* × *concinnum*). Upper sepals rose at the base, white above, with chocolate lines; petals and lip suffused with dark purplish-brown.

R. BROOMAN-WHITE, Esq., Ardarauch, Dumbartonshire (gr., Mr. J. King), showed a number of grand spikes of *Odontoglossum*, including a singular form of *O. triumphans*, three forms of *O. Andersonianum*, and several good *O. crispum* and *O. Inteo-purpureum*.

C. L. N. INGRAM, Esq., Godalming (gr., Mr. T. W. Bond), showed *Cypripedium* × *The Gem* (*Calypso* × *Leeanum*).

Awards.

FIRST-CLASS CERTIFICATES.

Odontoglossum crispum Mundyannum, from NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. William Murray).—A noble form of the *O. c. Franz Masereel* class, but with larger and better shaped flowers. The ground colour was white, tinged with rose, the greater part of the surface of the broad sepals and petals being occupied by large chestnut-coloured blotches, which in most cases were confluent. The fine lip had a yellow crest, with chestnut blotches on the front lobe, all the segments having a well-defined bluish-white margin.

Laelio-Cattleya × *Bertha Fournier* var. *splendida*, from M. CHAS. MARON, Brunoy, France. One of the finest of the large richly-coloured hybrids; it was obtained by crossing *L.-C. × elegans* and *Cattleya Dowiana aurea*, the present variety being far in advance of others previously flowered. Sepals and petals of a warm rose tint, with a freckling of cream-white showing between the veining. Lip broad, elongated, and wavy, of an intense ruby-crimson, with gold lines radiating from the base. It had the sweet odour of *C. aurea*. A vote of thanks to the exhibitor was also recorded.

BOTANICAL CERTIFICATES.

Zygopetalum Murrayanum, from the Royal Botanic Gardens Glasnevin, Dublin. A singular species, with spikes of rather small greenish flowers with some purple markings.

Dendrobium macrophyllum Richardi, from C. J. LUCAS, Esq., Warnham Court, Horsham. A curious form, with pale greenish flowers, having fine purple lines on the side lobes of the lip, and other obscure purplish markings on the front lobe.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman, and Messrs. Jos. Cheal, W. Poupert, H. Markham, Jas. H. Veitch, W. Pope, Geo. Kelf, Alex. Dean, S. Mortimer, W. Bates, Geo. Wythes, H. Somers Rivers, F. Q. Lane, Ed. Beckett, Geo. Bunyard, A. H. Pearson, and Rev. W. Wilks.

Mr. W. POUPERT, Marsh Farm, Twickenham, showed excellent samples of four varieties of Rhubarb, including Victoria, Daw's Champion, Lindens, and Hawke's Champagne. Also fine heads of Beakale and Asparagus.

Messrs. Geo. BUNYARD & Co., Maidstone, exhibited such a collection of Apples in 100 varieties that it would be difficult to praise too highly. The fruits represented the very best of late Apples for kitchen use or for dessert, and they were as fresh, plump, and bright in appearance as we should expect to see them in October. We specially noticed fine samples of Hambling's Seedling, Lady Henniker, Bow Hill, Annie Elizabeth, Blenheim Orange, Lord Derby, Gloria Mundi (very large), Gascoigne's Scarlet Seedling, Cox's Orange Pippin, King's Acre Pippin, Claygate Pearmain, Sandringham, Warner's King, Belle de Pontoise, Golden Noble, Bismarck, Royal Jubilee, and Catillac Pear (Silver Knightian Medal).

Mr. JNO. WATKINS, Pomona Farm, Hereford, made an exhibit of 100 dishes of Apples, including fifty varieties of kitchen and the same number of dessert fruits. The fruits were remarkable for high colour and moderate size. Most of the best late varieties in either section were included in the collection, and a few local sorts that the Herefordshire folk prize greatly. Amongst the latter were Stoke Edith Pippin and Cowarne Queening, both dessert varieties; Stoke Edith Pippin in appearance resembles King of the Pippins, but is apparently a better keeper. Cowarne Queening has probably been cultivated in Herefordshire for generations; it has a nice brisk flavour, and comes into use from October until January (Silver Knightian Medal).

Several varieties of Apples were submitted for Certificates, but none were recommended. Messrs. H. LANE & SON, Berkhamsted, showed Red Blenheim; Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, McIndoe's Bussat.

From F. W. CAMPION, Esq. (gr., Mr. J. Pitt), were shown excellent samples of Sutton's Perfection Asparagus (Cultural Commendation).

Awards.

Rhubarb Daw's Champion.—This is a variety obtained from a cross between Victoria and Champagne, and is said to come into use as early as Champagne, whilst in other respects it is much finer than that variety. The large, handsome, bright red-coloured specimens shown not only recommended the variety as a superior one, but were illustrative of high cultivation. From Mr. J. POUPERT, Twickenham (Award of Merit).

The Annual Meeting of Fellows.

At 3 o'clock in the afternoon, the annual general meeting of the Fellows of the Society was held in the Lindley Library. Sir Trevor Lawrence, Bart., President, was in the Chair, and most of the members of the Council were present, in addition to a moderate company of Fellows.

The minutes of the last annual general meeting, and of the special general meeting held in July having been read and adopted, a vote of thanks was passed on the proposition of Mr. Geo. Bunyard to the retiring members of the Council, Sir John T. D. Llewelyn, Bart., M.P., and R. McLachlan, Esq., F.R.S. Owing to the lamented death of Mr. Sydney Courtauld, there were thus three vacancies upon the Council to be filled, and no other gentlemen having been put forward but those nominated by the Council, these were elected. They are F. du Cane Godman, Esq., F.R.S., Sir John T. D. Llewelyn, Bart., and Arthur Wm. Sutton, Esq., V.M.H.

Sir Trevor Lawrence, in moving the adoption of the Report commented at some length upon the more interesting of its features. The Lindley Library had been given some attention, and acting on a suggestion of Mr. H. J. Elwes, the whole of the books have been enclosed in glass-fronted cases for the purposes of preservation and cleanliness. The services of Mr. S. T. Wright as superintendent at Chiswick were acknowledged in grateful terms. His able direction of the work in the gardens was as satisfactory as the influence for good he has exercised upon the students there. Congratulatory references to the Drill Hall meetings, to the Temple Show, and the Fruit Show held at the Crystal Palace were naturally received with pleasure. All were successful. Sir Trevor pointedly drew attention to the fact that the Awards made by the Society's committees during the past year, actually exceeded in number those made in 1898. It will be remembered that the Council a year ago suggested that the value of such awards might be diminished if too great a number be granted.

The Hybridisation Conference looked at from all points of view, said Sir Trevor, was a satisfactory event. In speaking of the number of foreign visitors present on that occasion, a touching reference was made to the subsequent decease of M. Henri de Vilmorin. The report of the proceedings of that Conference had been delayed through circumstances not under the control of the Society; many of the papers to be published had to be revised by authors upon the Continent and in America. The examinations held by the Society had been satisfactory. It was the desire of the Council to express their high sense of the Society's indebtedness to its Committees, the lecturers at its meetings, exhibitors, &c.

Coming to the paragraph in the Report which deals with the new Charter, Sir Trevor said the alteration had been made

in a very satisfactory manner, and so well advised were the Society, that the new Charter passed in the same form as it was submitted to Her Majesty. There now remains to be done the very serious work of drafting the new bye-laws that the new Charter renders necessary. This work had been deputed to a committee, and we understood the President to say that opportunities would be afforded the Fellows of discussing those which will be framed before they are actually adopted.

The Centenary of the Society's birth would take place in 1904, and, as stated in the Report, the Council has decided, after mature consideration, to celebrate that event by the purchase of a new Chiswick—a new experimental garden in a rural district that shall take the place of Chiswick, and probably by the establishment there of a horticultural college, and a thoroughly efficient method of giving theoretical and practical horticultural education. But Sir Trevor Lawrence had not any further information to give the meeting. Negotiations are now in progress, and at present the Council is not disposed to divulge how far these have progressed. Then Sir Trevor congratulated the Society upon its increased number of Fellows, now more numerous than at any other time in its history. From a financial point of view, there were equal grounds for satisfaction, the statement of accounts published with the report, showed a surplus upon the year's working of £1,751 8s. 9d. This is a larger surplus than has ever occurred in any one year. It will be reduced to some extent, however, by the publication of the proceedings of the Hybridisation Conference. Sir Trevor in conclusion, thanked the Council for the help they had given him, the Treasurer, Auditors, and Secretary, and spoke in the highest terms of the services of the Rev. W. Wilks, M.A., Secretary.

Professor Henslow, V.M.H., in seconding the adoption of the report, said that he did so, believing that in all respects it was most satisfactory. The council had held out to them a prospect of work that will greatly enhance the usefulness of the Society. After some remarks by another gentleman, Mr. J. Cheal said that the report showed an advance in almost everything. It seemed to him that the Society was turning over a leaf, commencing a new life, with a new charter. It had flourished because the management had dissociated itself from things outside horticulture. He had no fault to find with the Council in respect to the painting of Orchid pictures, but respectfully suggested that a little of the large surplus of money might be used for the provision of coloured pictures of the most noteworthy plants and flowers submitted before the other committees.

Subsequently Sir T. Lawrence explained that when the Council commenced the work in the case of Orchids it was done on the understanding that the committee paid half the cost and the Council the other half, but latterly the Council has paid it all. They had had a meeting, however, that morning, and it was decided that if the work was to be continued it must be upon the conditions originally agreed upon. Replying to a question from Mr. Geo. Paul, the president said that the Council was distinctly of the opinion that respecting the new Chiswick to be acquired, the society should become proprietors of the land.

Mr. R. Dean suggested that a little of the surplus revenue might be used to provide a lunch for the members of the Floral Committee upon the occasion of the Temple Show, and drew a melancholy picture of the sufferings of these hardy-treated gentlemen, in contrast to the fortunate persons selected as judges. The judges are provided with a free luncheon.

Sir Trevor said that the Council would no doubt consider the matter, but if it was decided to give a lunch to the Floral Committee it would not show greater appreciation of their services by the Council, who already recognised their indebtedness to the committee.

The report was adopted unanimously. Sir Trevor Lawrence, Philip Crowley, Esq., and the Rev. W. Wilks, M.A., were then re-elected President, Treasurer, and Secretary respectively.

It was unanimously resolved, upon the motion of Mr. Geo. Bunyard, that a vote of congratulation be sent to Sir Michael Foster, M.P., upon his election to the important position of representative in Parliament of the London University. A vote of thanks to the President concluded the proceedings.

Obituary.

W. H. LUMSDEN, F.R.H.S.—We regret to announce the death of Mr. W. H. Lumsden, F.R.H.S., of Balmedie, Aberdeenshire, on Wednesday, February 7, at the age of 48 years. The deceased had been in failing health for some months, but had only been confined to his room between two and three weeks. Mr. Lumsden was a keen horticulturist, and possessed one of the largest collections of Orchids in the North.

WILLIAM DIVERS.—We regret to have to chronicle the death, on February 12, of Mr. William Divers, in the 91st year of his age, at Noath Cottage, Linton, near Maidstone. He was gardener to the late W. Moore, Esq., of Wierton House, near Maidstone, for upwards of forty years, and relinquished his situation on the death of that gentleman in 1894. At the Maidstone, and other local exhibitions, he was well known as a successful exhibitor of Roses, Hardy Fruits, &c., and for many years he was an occasional contributor to the columns of the *Gardeners' Chronicle*. W. H. D.

TRADE NOTE.

MR. JOHN KING, COGGESHALL, ESSEX, &c.

WE regret to state that four days previous to the intended issue of Mr. King's Farm Seed Catalogue for 1900, the works of his printers, Messrs. Petty & Sons, Ltd., at Reading, were totally destroyed by fire, including the whole of the catalogues, chromo lithographs, process blocks, &c. He has arranged for its immediate reproduction, and hopes to have the new edition out in the course of a week or two.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period February 4 to February 10, 1900. Height above sea-level 24 feet.

Remarks.—The temperature has been very low, with cold, north-easterly winds; and snow fell to the depth of 4 inches on the evening of the 10th inst.

MARKETS.

COVENT GARDEN, FEBRUARY 15.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES

Main Crop, &c., 70s. to 90s.; Dunbar, 110s.; Other varieties, 65s. to 85s.; Seed Potatoes from 4s. 6d. to 7s. per cwt. John Bath, 32 & 34, Wellington Street, Current Garden.

REMARKS.—The Seville (bitter) Oranges for marmalade wine, &c., are now on sale. Savoyas are now small, the season being nearly over. They have realised good prices all through the season. Parsley has advanced in price, and the severe weather caused a limited supply on Tuesday; also of bunched Turnips and Carrots. Cape fruit include Peaches, in cases of 20 or 24, 12s. to 13s.; Plums, per case of 30 to 40, 3s. 6d. to 6s.; Nectarines, per case of 48, 10s. These Plums handle flaccid and soft. Some of the Burbanks are in shape like Washingtons.

FRUIT AND VEGETABLES

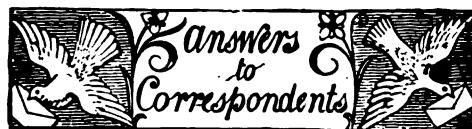

GLASGOW: February 14.—The following are the prices since our last:—Apples, Canadian; Baldwins, 15s. to 20s. per barrel; Northern, Spy, 16s. to 20s. do.; Greenings, 15s. to 18s. do.; American-Californian Pippins, and Newtowns, 9s. to 12s. per box; Grapes, English, 2s. to 3s. 6d. per lb.; do., foreign, Almeida, 12s. to 16s. per barrel; best, do., 20s. to 30s. do.; Bananas, extras, 9s. to 10s. per bunch; No. 1, 8s. to 9s. do.; No. 2, 6s. to 7s. do.; other and inferior, from 2s. 6d. to 5s. do.; Oranges, Murcia, 6s. to 8s. per half case Valencia, ordinary, 420's, 8s. to 9s. per box; large, 9s. to 10s. do.; extra large, 10s.; extra-extra large, 11s. to 12s. do.; Jumbos, 14s. to 15s. do.; 714's, 10s. to 12s. do.; Seville Bitter 10s. per half chest; Palermo, do., 5s. to 6s. per box; Lemons, Palermo, 8s. to 10s. per case; Mushrooms, 1s. per lb.; Tomatos, Teneriffe, deeps, 4s. 6d. to 6s.; cases, 7s. to 8s. 6d.; Onions, foreign, Valencia, 4 in a row, 6s. 6d. to 7s.; 5 in a row, 7s. 6d. to 8s.; Turnips, Swedes, 1s. 8d. to 2s. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 10d. to 1s. per dozen bunches; Cauliflowers, 1s. 8d. to 2s. 2d. per dozen; Cabbages, 9d. to 1s. 2d. do.; Celery, 6d. to 1s. 2d. do.

LIVERPOOL: February 14.—Wholesale Vegetable Market.—Potatoes, per cwt., Lynn Greys, 3s. 3d. to 3s. 6d.; Main Crop, 3s. 6d. to 4s. 6d.; Bruce, 3s. 6d. to 4s.; Champions, 3s. 6d. to 4s. 6d.; Turnips, Swede, 1s. 8d. to 2s. per cwt.; Parsley, 10d. to 1s. per dozen bunches; Onions, foreign, 3s. 9d. to 5s. per cwt.; Cauliflowers, 1s. 9d. to 2s. 3d. per dozen; Cabbages, 10d. to 1s. 3d. do.; Celery, 6d. to 1s. 2d. do. St. John's.—Potatoes, 1s. per peck; do. new, 4d. per lb.; Grapes, English, 3s. do.; Pines, English, 5s. each; Cobnuts, 1s. per lb.; Cucumbers, 1s. each; Mushrooms, 1s. 6d. per lb. and basket. Birkenhead.—Potatoes, 1s. per peck; Cucumbers, 1s. each; Filberts, 10s. per lb.; Grapes, English, 1s. 6d. to 2s. do.; do., foreign, 4d. to 8d. do.; Pines, English, 4s. to 8s. each; Mushrooms, 1s. to 1s. 6d. per lb.

CORN.

AVERAGE PRICES OF British Corn (per imperial qr.), for the week ending February 10, and for the corresponding period of 1899, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1899.	1900.	Difference.
	s. d.	s. d.	s. d.
Wheat	26 8	25 10	— 0 10
Barley	27 2	25 3	— 1 11
Oats	17 0	16 5	— 0 7

ADDRESS WANTED.—If this should meet the eye of the writer of "Sussex Fruits" in the *Gardeners' Chronicle*, he would oblige by kindly sending his present address to the Editor of this Journal.

AN INFESTATION OF CONSERVATORIES BY SPARROWS: *M. W. F.* Put nets over the ventilators, or trap the birds in nets. They might succumb to XL All vapour: it would at least stupify them, when it would be an easy matter to collect them; or worst of all means, lay down poisoned grain, if nothing else avails to banish them.

BOOKS: *Manual on Land Measurement*. Bath. You would obtain a suitable manual at Mr. Upcott Gill's Bazaar Office, at small cost.—*J. G. B.* *Economic Entomology* is published by Messrs. Chapman & Hall. Messrs. L. Reeve & Co. are the publishers of H. T. Stainton's *British Butterflies and Moths*, illustrated, price 10s. 6d.; *British Beetles*, by E. C. Rye, illustrated, 10s. 6d.; and some elementary works of a cheaper kind.—*G. Stratford*. Messrs. Cannell & Sons, Home of Flowers, Swanley, Kent, publish an illustrated work on carpet bedding. *A Subscriber*. *Handy Book of Bees*, by A. Pettigrew, fourth edition (W. Blackwood & Sons, publishers, London). For other bee manuals, inquire of Mr. Upcott Gill, Bazaar Office, 170, Strand, W.C. Bee journals are—*Bee-keepers' Record* (monthly), and *British Bee Journal* (weekly).

CARNATION DISEASED: *G. S.* and *Others*. The fungus attacking the "grass" in circular patches is *Helminthosporium echinulatum*. In mild cases use sulphide of potassium, 2 oz. in 1 gallon of rain; and in bad ones burn the entire plant forthwith.

CREEPERS COVERING THE SOUTH-EAST SIDE OF A MANSION: *A. B.* *Aristolochia Sipho*, *Ribes* (*Grossularia*) *fuchsioides*, *Clematis Jackmani*, *C. lanuginosa*, and varieties of these sections; *Magnolia grandiflora*, *M. conspicua*, *M. Lennei* or *M. Halliana*, *Bignonia capreolata*, or *B. radicans*.

DAHLIA LITERATURE: *B. C. R.* We might add to the number of books treating of *The Dahlia*, mentioned in our last issue, a work by Mr. R. Dean, R. Fife, and others, published by Macmillan & Co., Ltd., London.

IRON-IMPREGNATED SOIL: *J. C. & S.* Unless the iron be in excess it would not be injurious to trees, &c. Usually the iron-stone lies at some depth, and providing the drainage is good, such soil is not inimical to plant-growth. We have remarked good hedgerow and other timber, together with farm crops, doing well in Leicestershire on land 4 to 6 feet deep, overlying thick beds of iron-stone. The nature of the vegetation now growing on the land should afford you an idea of its capabilities.

LIFE OF JOHN C. LOUDON: *J. H. D.* Mrs. Loudon published an account of the life and writings of J. C. Loudon, which might be procured at some second-hand bookellers.

MARKET VINERIES: *Vitis*. Shelter and aspect, and other essentials, being equal or nearly so, we would advise the buildings to be erected on the pasture land, the turf forming the best kind of soil for the Vine. In any case you must make the drainage of the land as good as possible, and elevate the borders somewhat above the general level of the land. All the turf excavated for roads, &c., should be stacked, and the stacks kept free of herbage. It will come in for future use in border making, potting, &c.

NAMES OF FRUITS: *A. & Co.* 1, Irish Reinette; 2, Dutch Mignonne; 3, Nelson Codlin.—*J. H.* 1, Winter Codlin; 2, a small example of Harvey's Wiltshire Defiance; 3, Round Winter Nonpareil; 4, Martin Nonpareil.—*J. R.* 4, Ashmead's Kernel; 5, Barcelona Pearmain.—*C. W. S.* We can only suggest that your Apple may be the old Seek-no-Further. The specimens sent agree with that variety in several characters.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*S. G.*, *Wimbleton*. 1, *Adiantum Waltoni diffusum*; 2, *Blechnum occidentale*; 3, *Selaginella Wildevoni*; 4, *Dendrobium infundibulum*; 5, *Bilbergia nutans*; 6, *Adiantum bispiculatum*.—*G. S. W.* *Cypripedium villosum*.—*Oxon*. *Dendrobium speciosum*.—*C. de B.* A very interesting series of varieties of *Odontoglossum Inseayi* of the class called *O. Inseayi leopardinum*.—*W. P.* A fine form of *Dendrobium nobile*, but not specially named.

PILLAR ROSES: *A. B.* *Félicité-Perpétue*, *Madame Desprez*, *Rosa capreolata* (Ayrshire), *Lord Penzance's Briars*, *A. K. Richardson*, *Felleberg Noisette*, *Rosa Polyantha*, *The Boursalt* (*Rosa Alpina*) *Roses*, viz., *Amadis*, *gracilis*, *splendens*; the climbing *Devoniensis*, some of the hybrid *Bourbon* section are vigorous growers and very suitable, viz., *Chénédole*, *Coup d'Hébé*, *fulgens*, *Madame Plantier*, and *Paul Verdier*. Let the iron chains be painted green or bronze; galvanised chains are not good for plants.

COMMUNICATIONS RECEIVED.—Reading Gardeners' Society.—*R. D.*—*A. O. N.*—*J. K. K.*—*J. B.*—*B. Wadda*—*G. Waller*, Secretary, Yorkshire Gala.—*A. P.*—*L. A. L.*—*O. Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS' AND GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

SUPPLEMENTARY ILLUSTRATION.

Encephalartos Hildebrandtii, at Kew.

ROSE SHOWS OF THE FUTURE.

THERE have been "searchings of heart" in reference to Rose exhibitions: these have taken two directions, first of all the more artistic arrangement of exhibition flowers; and secondly, the difficulty which has apparently arisen with regard to the chief classes in the amateurs' division at the Metropolitan Show of the National Rose Society. This latter subject has been taken in hand in the pages of a contemporary by Mr. Charles J. Grahame in a thoughtful and practical paper, and his ideas are contained in the following sentences: "It is in order that there should be encouragement for such competition in the future that I now write, as I fear that if the highest prizes continue to go year after year to a few (a very limited few it is at present), the result may be that when those who are now almost always champions cease to exhibit, there will be no successors worthy of the name." There is no doubt that this is a difficulty. During the last few years the trophy has been carried off by three exhibitors; from 1890 to 1899 it was carried off by one exhibitor eight times, and by two others once each. One of these had since passed away, so that the prospect of a good competition is very slight. Yet I can remember the time when it was carried off by growers who had not anything like so extensive a Rose-garden as that of the present champion; and I think it is just possible that such growers have been deterred by the fact

that the first and second prizes are placed beyond their reach; while one other exhibitor at any rate (Mr. Machin) lives in the North Midlands, and consequently he can never get his Roses in good exhibition form as early as the metropolitan show at the Crystal Palace. But it may be said, cannot others take the place of those who have retired? Cannot they move up into some of the next classes, and compete for the championship? Yes; but in the present advanced state of Rose-growing, this requires considerable effort, and there must be at the same time a garden sufficiently large, and I would add, a pocket sufficiently deep, to enable them to grow such a quantity as that they might compete successfully.

With regard to Mr. Grahame's change, by means of which the owners of the Challenge Trophy for the last few years are to be excluded from competing: there is, I think, one very strong objection to it, and that is, that it would not be a Champion Trophy at all then, and the honour and glory of winning it would be greatly diminished. For instance, what would be said of the St. Leger race at Doncaster if the winners of the Derby and the Two Thousand Guineas were to be "scratched"? Surely the winner would not be so proud a man as he would legitimately be if he had had all the available horses against him, and yet had won the race. It is, in truth, a very difficult matter on which to decide. Time, which makes so great a difference in everything, may cut the knot.

I think it would be a most desirable thing if we could get a larger number of exhibitors in these classes; it may be true, that with so large a number of Roses we are sure to get some "tail," but also it must be remembered that it gives the opportunity for setting up Roses which, perhaps, we should not see elsewhere—though I am inclined to believe with Mr. Grahame, that a box of twenty-four or thirty-six is more pleasing than the very large exhibits. It does not seem to me, however, that the public think so, for it is over them that they most delight to linger and take their notes.

In regard to the other matter to which I have alluded, the more artistic arrangement of exhibitors' flowers, by which I mean those which are generally shown from amongst the Hybrid Perpetuals, Hybrid Teas, and Teas, I here again see great difficulties. It is most probable that if it were adopted, and Roses were exhibited in the way in which Mr. George Mount, of Canterbury, shows his splendid blooms cut with long stems, there would be considerable difficulty in adjudicating, and it must be remembered that all his flowers are grown under glass, and therefore are not interfered with by bad weather. If it were a very fine season, so that the outside petals of the blooms were not interfered with by either wind or rain, they might show very well; but supposing it were a bad season, a season like 1879, when the outer petals (especially of Teas) were in nearly all cases discoloured, what a poor outcome there would be on the exhibition table! and therefore in trying conclusions on this matter, I do not think we are to judge by an especially good season, but should take into account the many indifferent ones we are subjected to in our fickle climate. We remember the Rose shows of the past, and what a marvellous change has been wrought, mainly due to the operations of the National Rose Society; it is not, then, too much to hope for that some way may be found of solving the difficulty, but if the present champion growers are excluded

from competition, might they not possibly say we will have nothing to do with the Rose Show if we are not allowed to compete as heretofore? I do not say that it would be so, but I think there is danger of its being so. In saying all this, I am far from wishing any obstacle to be thrown in the way of Mr. Grahame's proposed arrangement; and if the committee of the National determine that it should be so, I am sure the members of the Society will endeavour loyally to carry it out. As Mr. Grahame says, I was opposed in the first instance to the revolutionary change which he proposed before; but seeing the successful carrying out of the scheme, I endeavoured to give it my hearty support. I always felt, however, there was this danger, that when successful exhibitors had made a stand in the lower classes, they would not care to run the risk of advancing into a higher one. In all this I am regarding it simply in that light in which I think a great many people regard prize-taking—the money amount of the prizes for which they contend. I know that there are some people who decry this, and call it pot-hunting; but when we know the trouble and expense which an exhibitor incurs, I think it is only fair that he should try to recoup himself for some of the money which he has expended. Our Rose amateur exhibitors are not, as a rule, a wealthy class; and no one ought to grudge them a certain amount to repay them, without exposing them to the charge of being mercenary. [What about the unsuccessful ones? Ed.]. The love of Roses is a very delightful thing; but, after all, it will not, like other sentiments of the same nature, confer any material advantage. It is very desirable that a greater *esprit-de-corps* should be manifested amongst our exhibitors, and the honour and glory of the prize be more considered than the pecuniary remuneration. *Wild Rose.*

ORCHID NOTES AND GLEANINGS.

LINDENIA.

THE number which was published on January 30 of the present year contains coloured figures and descriptions of the following Orchids:—

EPIDENDRUM, or *BARKERIA ELEGANS*, t. DCLXXXI. A Mexican species, introduced by Ghiesbreght. The flowers are in loose racemes, each about 2½ inches in diameter, with oblong, pointed white segments, lip projecting, keeled, white, with a deep purple spot. The column is bent downwards upon the lip.

CATTLEYA LODDIGESII var. *HARRISONIÆ* ALBA, t. DCLXXXII. A pure white form of *C. Harrisoniæ*, differing from *C. Loddigesii* in the frilling of the anterior part of the lip.

LÆLIA RUBESCENS, Lindl., t. DCLXXXIII. Flowers racemose, rosy-lilac, nearly 3 inches across; lip: *envy*: ute at the base, with a purple spot, anterior lobe broad y la: *colata*.

CATTLEYA LABIATA ALFREDIANA, t. DCLXXXIV. A form with the segments of a rich vinous purple, irregularly streaked and blotched with white.

VEGETATION OF GERMAN SOUTH-WEST AFRICA.

AN UNVISITED TRACT.—I am sending you a few lines about a part of this country, which scientific travellers have never before visited. I mean the southern border of the Etosa basin. It was in the second half of June when I heard that two farmers of Grootfontein intended to start with ox-wagons for Pnamutoni, and to go therefrom along the Etosa basin over Okakuejo to Okaakana, in order to fetch from a short distance from the last-named locality a year's provision of salt for their cattle. As I had not anything more to do in Grootfontein—the vegetation being as dormant as in Europe in winter time—I decided quickly not to let such an opportunity escape, but to accompany the party,

although I could not hope to make in this dry winter season many new botanical discoveries, but perhaps a few in the geographical line.

Starting on June 28 from Grootfontein, we arrived the same evening at Jankbas, Mr. Erikson's farm, where I found in a swamp a flowering *Zanichellia* or *Ruppia* (I do not know the distinguishing characteristics of these genera). Through a wonderful park-like landscape, consisting chiefly of dark, red-fruited *Terminalia prunioides*, *Combretum primigenium*, *Acacia hebeclada*, scattered *Sclerocarya*, and *Tambotis* (as the Boers call it). This looks like a very straightly grown *Prunus Mahaleb*, the extremities of the slender hanging branchlets and the leaf-axils bear small catkins; the seeds are said to be able to move by the action of a larva buried within them. The milky juice of the bark and leaves are very poisonous. At Karnchas, where we outspanned on June 29, we met a number of bushmen, who smoked from a big horn of the Kudu antelope, "Dacha" (*Cannabis*). This is a custom, not originally in-

I found two yellow-flowering *Grewias*, *Grewia avellana*, six species of *Acacia*, eight species of *Acanthaceae*, *Boscia salicifolia* (Witgat of the Boers, of which the soft and sugary roots are used as a substitute for Coffee), *Boscia foetida* (which I called erroneously in my former article "The Fishriver," a *Celastrineae* called Stinkbush by the Boers), a very spiny *Celastrus*, two *Ficus* (one of them the majestic *F. damarensis*).

The leaves of the different *Combretums* were turned dry and yellow by the ascending heat of the bush fires, and had begun to push out young, tender twigs and flower-buds in the axils of the dead foliage. I am convinced that if the fires continue twenty years longer in this region, all the extensive forest districts will be destroyed. Every day we had to cross bush fires. The fires are mostly caused by bushmen, who start them on the grassy plains in order to find the edible bulbs and tubers of *Cyperus esculentus*, and of various *Asclepiadaceae*; from the plains it spreads, of course, into the forest.

where we took possession of the old empty store-house, which the soldiers built three years ago at the beginning of the rinderpest plague. It was then an important point of the rinderpest protection-line, that was formed between the Heroróland on one side, and Ovamboland and Bechuanaland on the other side, to keep a check on the traffic of cattle. The view from this house is very extensive, over an enormous absolutely flat, grassy plain, covered by black forest. The Etosa basin, is hidden behind a strip of forest land. The most interesting thing among the few that I collected at Onamutoni is a *Hydnora*, that grows on the roots of *Acacia hebeclada* (I found it first 10° more south, near Keetmanshoop, upon the roots of *A. horrida*). The fruits, situated four to six together, below the surface of the soil, are as large as good-sized Apples, and contain many thousands of seeds, which may be eaten, when perfectly ripe, even by Europeans; unripe, they contain a high percentage of tannic acid.

On July 20 we started from Onamutoni for

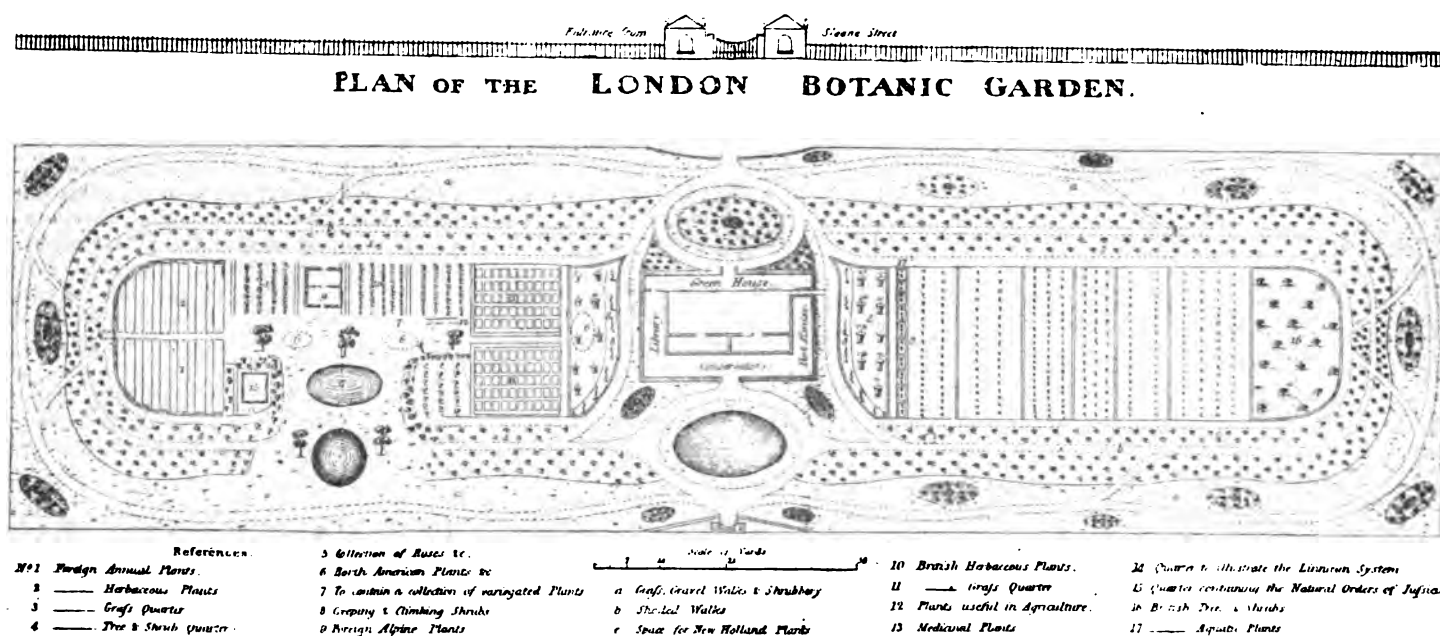

FIG. 34.—(See our issue for February 3, 1900, p. 65.)

digenous here, but introduced from the south-east of Africa, where the Zulus especially are noted hemp-smokers.

The following day brought us as far as Tseweb, where I collected a white-flowering climbing *Jasminum*, an *Aegilops*! and noted many trees of *Diospyros mespiliformis*, but without fruits. As we had collected on our path a few bags of the yellow Plum-like fruits of *Sclerocarya Schweinfurthiana* (similar to Walnuts, but instead of the green and bitter shell, they have a very sweet and scented pulp that adheres to the nut). We set an Ovambo, one of our coloured people, to work, to make a kind of beer, the national beverage of the Ovambos. As the juice is very sweet, it becomes very intoxicating after fermentation.

On July 2 we crossed forests consisting mainly of *Balsamea* (small thorny trees of a very clumsy aspect, with greyish-green bark, which can be easily torn off like that of Birches). Next day we passed a forest with several wonderful groups of *Hyphane ventricosa*, varying in height from 8 to 12 m., most of them were males, and there were only three females, bearing each two or three trusses 3 to 4 ft. long, with brown fruits the size of Apples. Our path led constantly through bush and forest-land, and besides the above-named trees

Nu-gusib, the last water before Onamutoni, is situated in a very extensive forest of *Copaifera Mopane*. Here I saw for the first time this beautiful tree as a predominating forest tree, which, with its thick rounded crown of *Bauhinia*-like foliage, and a straight stem, makes a deep impression upon the traveller, reminding him somewhat of the fine Beech forests of his fatherland. A fresh green branch, held over the fire, after a few moments, burnt with a wonderful white flame, on account of its resinous properties. The trees were full of fruit, which contain one large and very peculiarly-folded flat seed covered with numerous bristles of yellow *Copaiva Balsam*. It is not unlikely that in time *Copaiva Balsam* will be an important article of exportation from this country.

Hitherto German South-West Africa has exported only guano, a few thousand seal-skins, ostrich-feathers, a few bags of gum (of *Acacia horrida*), and a good many ethnographical curiosities. This is very little; and it will remain little, if the rich copper-mines are not reopened. You may recollect that I told you that a company with 2,000,000 pounds capital, had been constituted, in order to explore the Otavi and Tsamab copper-mines. Just now nobody speaks further of this matter.

Onamutoni was reached at last on July 13,

Okaakana. Our road went down to the east end of the Etosa basin, which was lying before us after a short "treck" in its entire and enormous extent, flat like a table, in many places covered with snow-white salt layers. There was no water in it, but the clay bed of the basin was still so wet that we preferred to keep to the ordinary road along the southern side. If you look at the best existing map of German South-West Africa, that of Langhans, you will find at the south side of the basin, the words "Waterless Desert." But such is not the case. I found almost the whole region covered with wonderful *Copaifera* forest, mixed in some places with *Acacia hebeclada*. The sixth day after leaving Onamutoni, having passed nine constantly-flowing fountains, we reached Okakuejo, a fountain about 20 kilometres in a westerly direction from the Etosa basin. Here we met with two missionaries of the Rheinisch Missionary Society, who were on the way to their station in the province Mosametes, not far from the Kunene. We travelled together as far as Okaakana, where we separated, the missionaries going northwards, and we went back the same way that we had come, and that without the salt! Here in Okaakana our seven "span" oxen had emptied at once the four pits, which did not fill again, thus we could not attempt to go further to the salt layer, which was still 40 kilometres

distant, without knowing with absolute certainty, whether we should find a sufficient water supply there. I increased my list of collected plants by 35 species only during the whole long journey, among which the most interesting are one *Fouquiera*, one *Typha*, three *Polyporus*, and three *Acacias* new to me. The 4th August we arrived again at Amutoni.

I enclose a specimen of a very interesting plant, which I take, although it has a very peculiar exterior, for a *Portulacacea*. It is growing near Windhoek as well as near Grootfontein in the north, and Bersaba in the south, in hard, clayey, sandy soil, sprinkled with pieces of quartz. I put in February, shortly before starting for the north, half-a-dozen of these plants into a wine-press,

My opinion is, that this is a very characteristic form of self-protection, or true mimicry (or intended mimicry), while the imperfect affinity of two plants from different countries is a pure coincidence, effected by similar conditions of existence; but is not, as Mr. Williams considers, mimicry. I use the technical term mimicry in the same sense as that in which Dr. Marshall used it in an entomological article in *Vom Fels zum Meer*—that is, as meaning self-protection, as when a locust imitates a green leaf, or piece of grass or sandstone, or a butterfly has the colouring and form of the wasp.

I was not hitherto aware that *Acacia* belonged to the category of the ant-plants; I learnt it only a few days ago from a friend. I put a pair of

about six square miles, and growing together, three *Campanula*, one *Laurentia*, seven *Lobelia*, one of the genus of which I was not able to find out with the *Flora Capensis*.

The number of *Acacia*, including *Albizzia*, I have collected so far in the country, amounts to 18 species. The number of *Utricularia*, 4; ditto *Orchids*, 4; ditto, *Orobanchaceae*, 4. I never found any *Aroids*. *Dinter*.

NEW VARIETIES OF LILAC.

THE Lilac in its several forms has been greatly improved during the last quarter of a century, and chiefly by one hybridist, Mr. Lemoine, of

MADAME CASIMIR PERIER.

Top—MADAME LEMOINE.
Bottom—ANDENKEN AU LOUIS SPÄTH.

PRESIDENT GRÉVY.

FIG. 35.—NEW VARIETIES OF LILAC.

together with some others, and left them here in Windhoek under the hot iron roof of a store, in order that the plants should not become mouldy during my absence. I was rather puzzled to find the plant, when I returned to Windhoek in the middle of October, still almost as fresh and healthy as it was in February, eight months earlier, only the stems were a little lengthened and pressed, and the thick roots a little shrivelled. The same was the case with *Portulaca quadrifida*.

A yellow-flowered *Mesembryanthemum* (which is not one of the ten species enumerated in *Harvey & Sonder*) frequently grows near the *Portulaca*, but is even more dependent on the small rounded pieces of quartz. This plant so closely resembles, when not in bloom, the form and colour of the pebbles among which it grows, that it can only be detected by an experienced eye.

opened spines with ants by. Spines, infested by ants, are thicker than healthy ones.

The tubers of *Aponogetons* possess a tenacity of life similar to that peculiar to those of *Liliaceae*; in February, I collected in a pond east of Windhoek an *Aponogeton*; as the leaves were dry and thin, after two days more drying, I thought the bulbs also would be dry. When putting my herbarium into order a few days ago, I discovered that the tubers were as fresh as if collected yesterday. I put one of them into water and it is already beginning to grow! The importation of this charming little plant is therefore very easy, although previously I thought it impossible.

In October I was two weeks botanising in the Anas mountains, two hours south of Windhoek. There I found on the borders of a "Riva," not fewer than six *Campanulaceae* upon an area of

Nancy, whose efforts have had marvellous results. At Stuttgart, in the nursery of Mr. Wm. Pfitzer, senior, there is a fine collection of the best of the older varieties, as well as the most recent novelties. This nurseryman has always taken great interest in Lilacs, and he tests all the new varieties in his romantic garden on the hillside of the picturesque Hasenberg. It was always a pleasure to me to spend a few hours among them on fine May mornings, and many were the passers-by in the adjoining street who were attracted by their beauty and fragrance.

The collection consisted mostly of standard trees, 10 to 12 feet high, which are generally garnished with *Clematis*, *Roses*, *Forsythias*, *Jasmines*, &c., thus hiding the naked stems. It included most of the best single and double-flowered varieties enumerated in nurserymen's

lists, from the earliest to the latest varieties. Those tried and found wanting were re-grafted with something new, thus making fine strong plants. Lilacs are very attractive in the month of May; but desirable and beautiful as they are, they should not be planted in great numbers in small gardens, as, after flowering, the shrubs offer few attractions. For affording flowers in the winter months, they are almost invaluable. Taking our illustration (fig. 35, p. 115) from the left to the right, we have first Madame Casimir Perier, one of the most beautiful of the double white varieties, having large double creamy-white flowers. It is an improvement on Madame Lemoine, in being dwarfer and more floriferous; it forces capitally. The illustration affords but a faint idea of its beauty. The variety at the top in the central vase is Madame Lemoine, a beautiful variety, with large, double, pure white flowers, a variety which has received awards wherever exhibited. It is an excellent forcing variety, and very free-flowering. Its enormous trusses of bloom consist of about six spikes, with several smaller ones between them, the whole forming a dense mass of flower, as the annexed photo shows.

The variety occupying the lower place in this vase is Andenken an Ludwig Späth, named in English catalogues Souvenir de Louis Späth, and is one of the finest varieties in existence. It is distinct, possessing large, graceful spikes of a foot in length, of dark reddish-purple flowers, two or more of which are produced together on one branch; it is excellent for forcing.

President Grévy occupies the third vase in the line. It is a beautiful variety, with fine trusses, and may be best described as an improvement on Mishel Buchner. *H. R. W., Clapton.*

VEGETABLES.

SOME POINTS IN CELERY CULTURE.

In order to produce good Celery, it is essential to allow the plants a long season of growth, to permit no check, and to cultivate highly. Taking these points seriatim, it is unadvisable to defer the sowing of the seeds till so late a part of the spring that it becomes impossible for the plants to attain to their greatest possible size. For this reason I like to sow for the main crop sometime between the middle and the end of February. Germination may be aided by means of artificial warmth immediately the leaf appears. A cool temperature should be afforded, where, while growing, they may in no sense of the word, be excited. About the middle of April, and sometimes earlier, the seedlings will have reached a stage when they should be transplanted singly into beds out of doors, and any delay, once the seedlings have reached a size suitable for this operation, exerts a lasting injurious effect on the plants. A striking instance of this occurred in my own case last year, when, through a mistake, a smaller number of seedlings was pricked-out than was required, and these when finally pricked-out remained all through weaker than the early batch. All this stage, I think, a mistake is not uncommonly made in providing a too porous compost, and in making the bed of soil too deep. For my part, I find that the plants succeed better in a 2-inch layer, firmly compressed, of equal parts of strong loam and spent Mushroom-dung. The substratum is a thick layer of coal-ashes, beaten down till it is hard and level. The seedlings are dibbled in, thirty across a 6-foot frame, or about 2½ inches apart.

The next point of importance is the preparation of the trenches. Having to produce a large quantity annually, I prefer four-line trenches, the ridges being 4½ feet, and the trenches 4 feet wide. Advantage is always taken of an opportunity to prepare the trenches some weeks before the plants are ready. By this means the ridges can be the sooner utilised for cropping; culinary Peas, Lettuces, and Turnips being the crops most generally taken—and in order to secure to these the fullest

advantages, the ground occupied by the ridges is previously deeply dug, the trenches being thrown out. The depth for the latter should be sufficient to allow of the soil being made level with that of the garden, once the necessary manure has been wheeled in. The last named, a mixture of cow and horse dung, is 6 inches thick, spread equally over the trenches; and in digging it is mixed with the soil to its entire depth, the practice of placing the manure in a layer in the bottom of the trench, and above that the unmanured soil, being less conducive to an uninterrupted vigorous growth. Following the digging, a slight dressing of Mushroom-bed dung is applied to the surface and hoed-in; and in addition, just before the plants are set out, an application of superphosphate is made. Ours is open and light soil, and I find it distinctly advantageous to afford firmness by trampling it, which has the effect of preserving it in a healthy moist, state, and it also conduces to a less rapid extension of roots than otherwise would be the case.

As regards planting, the time chosen is either the end of the month of May, or quite the beginning of June, and if possible in damp weather. Last year, for instance, the plants were fortunately transplanted while the soil was so moist as to need no water, and as a fact, not any was applied last year, one of the driest of summers. The benefit of a shallow and firm preparatory bed is apparent when transplanting. The plants being lifted on spades in "turves," each one comes apart from its neighbour a nice rooted mass, and is covered with an inch of soil when planted, pressed down with the foot, the surface being afterwards Dutch-hoed, a process that is occasionally repeated, in order to keep the surface friable. Two months subsequent to planting, I find it distinctly favourable to the growth of the plants to introduce from the sides of the ridges sufficient soil to cover the surface 2 inches in depth. The middle of August sees, perhaps, 200 plants earthed-up, and these will be ready for use towards the end of September, at which time a second batch should be treated in the same manner, and the remainder one month later.

A simple method of keeping the stalks close while earthing them up consists in running a string from end to end of each row, binding, without however tying, each plant with the string, and securing each end to a stick to keep it tight. A long row can be tied in this way in a few minutes. When the earthing-up is finished, the string is drawn out and used for another.

There are so many fine varieties of Celery in cultivation that it is almost needless to name any. For many years I have relied on Standard Bearer for the latest supply, that is, up till April; and for autumn and early winter my favourite used to be Sandringham Dwarf, but that variety has of late years been superseded by Veitch's Superb White. Both varieties produce thick, bulky stalks, and the blanched portion is invariably also thick, an essential condition where Celery is a favourite salad. *R. P. Brotherton, East Lothian.*

VARIATIONS PRODUCED BY GRAFTING, AND THEIR INHERITANCE.

(Concluded from p. 88.)

INARCHING.—Before proceeding to consider mixed grafts, allusion is made to inarching where the plants are not severed above or below the union, each still remaining in connection with its own roots. Such a process may have a practical value, for although it is of no use to increase the size of the plants, Cauliflowers from which seed is usually obtained with difficulty, readily fruited when treated in this way.

By mixed grafts a balance is able to be kept up between the functional activities of stock and scion, and success otherwise impossible obtained. Such a case is illustrated by the grafting of a deciduous plant upon an evergreen; here the stock expects the scion to work in winter, but having lost its leaves it cannot, and the graft fails. If some of

the branches of the evergreen stock are allowed to persist, however, the difficulty is got over.

M. Daniel was enabled to maintain a Pear scion on a Crab-stock for a longer time than usual (1892—1898) by using the mixed graft, but being left to itself it became exhausted in the end.

Grafts were made during germination between the black Belgian Haricot (with three or four violet flowers in the inflorescence) and the large Soissons variety (with a score of yellowish-white blossoms in the head), the latter being the stock. One series had all the lateral-buds removed from the stock, and so consisted of simple grafts; in the second the shoots springing from the region of the cotyledons were allowed to grow, and mixed grafts resulted. As might be expected the evils of altered nutrition were apparent in the simple grafts, and these were stunted. Little apparent difference in growth was manifest however between the scion of the mixed series and the control plants. In one case, however, a graft produced a head of nine dirty-white flowers, streaked with violet.

It is not surprising that the chief differences should appear in reproductive organs to the formation of which both components of the mixed graft contribute material they have elaborated, and this is particularly the case when seeking seed from the graft, the stock has not been allowed to fruit, and *vice versa*. The practical value of mixed grafting for the production of hybrids without the intervention of sex need not be dwelt upon, but at the same time its possibilities for lessening the undesirable variation due to nutrition alone must not be lost sight of.

INHERITANCE.

The second part of the paper deals with the inheritance of the characters produced by grafting, and is based, naturally, upon experiments with herbaceous plants, seeing that the time necessary for observation upon successive generations of trees precludes such investigation upon the part of a single individual. As might be expected, the young of plants stunted owing to bad nutrition after grafting, were themselves degenerate. On the other hand, the large seeds produced by wild Carrots on cultivated stocks produced plants that approached to the latter in habit. A remarkable percentage of variations (the cotyledons varied in number from 3 to 1) was also noted, and several intermediate characters.

The seedlings from an Alliaris on Cabbage, recalled the appearance of the latter, and would have been set down as at least a new variety by a classificatory botanist. It has been found impossible to produce sexual hybrids between any two distinct species of Cruciferae by several workers, and the one recorded case is still contested. Hence the practical importance of a process which will bring about a variation in the first generation. Notable also are the Kohl Rabis obtained from the white variety grafted on the red; the "new" variety remained sound in the wet autumn of 1894, when many of the control plants rotted from the severe winter that followed, and while the former survived all the other members of the Cabbage tribe succumbed to the frost. Other instances are given, and the transmission of characters by vegetative reproduction of the stock shown to be partial with the Potato and Jerusalem Artichoke. From the seeds of the Haricot Beans above described, where there were mixed grafts, the streaking of the flowers was not transmitted; but this is the only experiment at present made on such grafts.

M. Daniel concludes that the direct influence of the graft is not universal; that he has proved that actual variations, apart from the effects of nutrition, are at times induced; that these being acquired by the plant during its lifetime and transmitted to its offspring, Weissman's contention is not good so far as plants are concerned. We will not here go into the question any further than to point out that what M. Daniel calls the progeny of a grafted plant—the true graft hybrid, in fact—may be looked upon as springing from two plants, when acquired characters in the special sense of the word might not come in.

ODONTOGLOSSUM CRISPUM MUNDYANUM.

Our illustration (fig. 36) represents one of the two fine *Odontoglossums* exhibited by Norman C. Cookson, Esq., Oakwood, Wylam, Northumberland (gr., Mr. Wm. Murray), at the meeting of the Royal Horticultural Society on February 13, when it was awarded a First-class Certificate; the other, *O. c. Cooksoni*, having previously been given a similar award. *O. crispum Mundyianum* takes high rank in the fine section which includes *O. c. Franz Masereel*, *O. c. Ashworthianum*, and a few other famous varieties. The ground-colour of the flower is white, tinged with rose-purple, and heavily blotched with chestnut, or red-brown, the central area of the lip being bright yellow.

MARKET GARDENING.

PALMS FOR MARKET.

CONSIDERING the enormous consignments of Palm-seeds annually imported, it is somewhat remarkable that our markets never seem to be

dealt with as soon as received, and it is of importance that they should not be allowed to get quite dry, so that if they cannot be sown as soon as received they may be turned out of the packages and covered with Cocoa-nut fibre refuse, or other moist material. Or if they arrive in a dry state they may be put into water for a short time, but it is not advisable to leave them in water for longer than one day. I find the fibre is a good substance in which to germinate them. Some growers clean the husks off before sowing, but this is waste of time. Having to deal with a large quantity this season, they were put in as received, and they have germinated as well as any I ever had to handle. When sown in cocoa-nut fibre refuse they should be taken out and potted singly as soon as the first leaf begins to expand. In potting, it is very important that the soil should be pressed firmly, and that the roots should not be broken. For the first potting, good loam, with sand added, may be used, and for later pottings some manure may be added; or if the loam is close and heavy, a small quantity of peat may be added. Over-potting should be avoided, for with large pots they are liable to get too wet, through the constant

pulpy, with a bright bluish outer surface; if the seeds are put in water this may be washed off, but if the covering has dried up it may easily be rubbed off. The cultural remarks above may also be applied to this Palm, except that they must be grown on throughout under one method of treatment. Those grown close together in a high temperature make long leaf-stalks, and for some purposes are more useful than the spreading plants with shorter stalks. The latter are certainly the most symmetrical, and when those that have been drawn up are exposed to more light and air the new leaves do not correspond with the older ones. The most useful size plants are those in 32's (6-inch pots), as in a 48 it hardly gets sufficiently characterised, though large quantities are sold in this size; extra large plants are not much in favour, as they spread too much. *Livistonia chinensis* is the most correct name perhaps, though I think, as a market plant, it will be a long time before it is known by any other than *Latania*, or *Fan-Palm*. *Livistonia rotundifolia* and *L. altissima* have been tried, and they make fine plants, but do not withstand hard usage so well, or find so much favour as market plants.

ARECA LUTESCENS.

This is an old favourite, but since the *Kentias* have come to the front it has been rather neglected, though at the present time there is a fair demand for plants in 48's and 32's. It is often grown with three plants in the same pot, being rather too thin a plant when grown singly. The seeds are very uncertain: when good they germinate quickly, and almost every seed in a large consignment may retain their vitality; while I have seen other consignments which had, to all appearances, been packed in good condition, have reached their destination in a useless condition, and every seed has refused to germinate. One importer from South America adopted the plan of sowing the seeds in boxes, and this proved fairly successful, most of the plants making a good start before reaching this side. When seeds are received in a dormant condition they should be sown immediately. It requires stove treatment, and although it stands well during the warm weather, it is of little service for winter work.

COCOS WEDDELLIANA.

The seed-crop of this useful Palm is very uncertain; some seasons we get very large importations of seed in fine condition, while it sometimes happens that the crop entirely fails, and the small quantities that are received are of doubtful quality. This makes it difficult to keep up a regular succession of the various sizes, a most important matter in market-growing. Some growers put the seeds in singly in small pots as soon as received; but they may be put in moist fibre, and taken out as they begin to start. It is, however, most important that they should be potted before they have made much root, for if the tap-root gets damaged they never make good plants. They may be potted in a lighter compost than the stronger-growing Palms; a humid atmosphere with bottom-heat, and avoid over-watering. It does not take up so much moisture as most plants, and when the soil once gets soddened, the plants are sure to get into a sickly condition. It is generally supposed that this Palm is too tender for ordinary house-decoration, but I have found it stands well if not too much exposed or over-watered. Either in a small state as a table-plant, or in larger sizes for groups, &c., it is one of the most elegant Palms we have.

PHENIX.

There are several species grown, the most elegant being *P. rupicola*, which after it gets a few well-characterised leaves has a bright and graceful appearance; but it requires careful treatment, the leaves being much inclined to die-off from the points of each pinna. I think a low temperature and too much moisture at night is the chief cause of this. *P. reclinata* is a more vigorous-growing species, and makes a useful plant. *P. tennis*, or

FIG. 36.—ODONTOGLOSSUM CRISPUM MUNDYANUM.

over-stocked with good plants of the more useful sorts. It is some years since it was generally predicted that *Kentias* would come down to a very low price, but as far as I know of this has not yet occurred, for during the autumn trade sales good prices were maintained for useful stuff, and although it may sometimes occur that the supply of some species exceeds the demand, it will be the exception rather than the rule. The really marketable sorts are confined to a very few species. *Kentias*, of course, take first place. A few years ago *K. Belmoreana* was first, but within the last two years *K. Fosteriana* has been more in demand. They are both equally useful; *K. Belmoreana*, as a 48-size plant for tables, &c., is the more elegant, but for larger specimens, *K. Fosteriana*, which grows taller, is more serviceable for decorations. *K. Canterburyana* grows too slow whilst young, but later it attains to a good size, and forms a plant well furnished with stiff-stalked recurved leaves.

CULTURE.

The *Kentias* may be grown under a variety of conditions. In the first place, the seeds should be

syringing necessary to keep the foliage clean. Although *Kentias* like a moist atmosphere, it is a great mistake to give too much water at the root; and with liquid-manure afforded occasionally, they will thrive better in comparatively small pots. I have seen them grown in 48-sized pots until they have attained to a size larger than are often grown in 24-sized pots. *Kentias* grown under various modes have a widely different appearance; when plunged where there is a good bottom-heat, and kept close together, they run up tall; but to make really useful plants, they should not be plunged after they are potted into the size they are to be sold in, or, I might say, after they are in 48's. To make well-furnished plants they should have sufficient room. Although they may be grown on in a high temperature, they should be gradually hardened off, and in selecting plants for immediate use those with the youngest leaf well developed should be taken.

LATANIA BORBONICA.

This is another popular Palm, the seeds of which are usually very cheap, and germinate freely. When received quite fresh the outer covering is soft and

canariensis, may also be mentioned. Seeds of all these are usually very plentiful, though until quite recently *P. rupicola* commanded a high price.

CORYPHA AUSTRALIS.

This is a very hardy Palm, and although it never makes such a high price as most others, it is worth growing, and provided the plants are kept free from insects, they may be crowded together wherever it is convenient to stow them, either in a cold-house or the stove. Those grown in the stove make the most useful plants; in a cool-house it is short and heavy. It may be grown under almost any conditions, and will last as well as the *Aspidistra*. There are other species of Palms grown to some extent, but those referred to in this article include all that is most useful. *A. H.*

ALPINE GARDEN.

RANUNCULUS LYALLI.

It is somewhat disheartening to be unable to find anyone who has been successful in permanently establishing *Ranunculus Lyalli* in the open in the United Kingdom. A few years ago so many plants were disposed of by dealers in hardy plants to growers in all parts of these islands, that it was to be expected that some one or other would have persuaded it to become a permanent occupant of his garden. Unfortunately this does not seem to have been the case. With the greater number the Shepherd's Water Lily was an entire failure, and died without producing a flower. In a few instances it flowered, but these were exceptional, and even there it does not appear to have long survived its seed-bearing stage. One of these places was the unique garden at Easter Duddingstone Lodge, near Edinburgh, of the late Mr. Charles Jenner. Unfortunately for me, I was too late to see it in bloom, but it was then giving promise of producing a crop of seeds. The plant looked very healthy in its place in a sheltered rock-garden, but it afterwards succumbed. I have made inquiries of many who had been anxious to grow *R. Lyalli*, but up to the present I have been unable to come across anyone who has been any more fortunate than was Mr. Jenner, whose then gardener, Mr. Mungo Chapman, now of Torbrex Nursery, Stirling, was an exceptionally good grower of hardy flowers. I do not offer any explanation of the cause of the failure of this plant in our gardens. We should be more likely to discover what this was if anyone could show us under what conditions it has been established in a garden in the United Kingdom. This would not prove that it could be grown in every garden, but it would give a stimulus to a few who have not yet lost hope of establishing this fine flower in British gardens. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

AN EARLY-FLOWERING SNOWDROP (*GALANTHUS BYZANTINUS* VAR.).

Some years ago, Mr. James Allen, of Shepton Mallet, and the writer, obtained through a correspondent, a number of bulbs of a Snowdrop collected near Broussa. When this flowered with us it appeared to be the same as that described by Mr. J. G. Baker in the *Gardeners' Chronicle*, Feb. 25, 1893, p. 226, as *Galanthus byzantinus*, a new species. It was afterwards identified as being that species, which is intermediate between *G. plicatus* and *G. Elwesii*. These Broussa bulbs gave flowers of much diversity of form and markings, some of them approaching closely to *G. plicatus* and some to *G. Elwesii*. The leaves of some were plicate, and others were similar to those of *G. Elwesii*. They have every appearance of being natural hybrids. In addition to their other differences, the plants flower at various times; and three or four years ago Mr. Allen informed me that one of his plants was among the first Snowdrops to bloom after the new year.

Last year he very kindly sent me a bulb, and this season it has been the first to bloom since January 1, with the exception of *G. Elae*, which ought to flower in December here, but has been late for once. I observed this early variety on January 17, which is several days earlier than the blooming of the other spring Snowdrops, which seem, by the way, to be rather later this year than is their wont. This variety is not large, but is of great purity of colour, and looks pretty in the rock-garden where it is grown; the leaves are broad and slightly plicate. The Snowdrop is very welcome in the opening of the year, and one is glad to have a variety which will be a precursor of its sisters. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Strawberries.—The earliest plants now passing out of flower may be afforded a much higher temperature if early fruiting be desired, but if fruit of the largest size and finest quality is looked for, a moderate degree of heat, namely, 60° to 65° at night, and 70° by day, with 10° rise by sun-heat, will bring them forward sufficiently rapid. The plants during the last stage should receive full sunshine, and to do this conveniently they should be placed on shelves near the roof and afforded air freely whilst ripening. The short period of time between setting and ripening must be taken advantage of to sustain the plants with rich nutriment. Manures of a pasty nature should be avoided as they clog the soil, and render it sour and unhealthy, spoiling the flavour of the fruit. Clear liquid made with sheep or deer-droppings is good; and an easily-made manure, clean in use, and quick in action, consists of ½ oz. of sulphate of ammonia stirred into a gallon of water. Continue to introduce fresh batches of plants into any forcing-house that is started, or failing these into hot-water pits, &c.

Peaches and Nectarines.—In the earliest house the trees will require the frequent removal of young shoots, until finally disbudded. Crowding of the growths is bad practice, one shoot at the base and one leader being all that are required by trees that have filled their allotted space. In all cases, whether on back walls or trellises under the roofs, the future shoot should be taken from the side where it will be most convenient for training in. All foreright shoots should be removed entirely, and the tying of the selected shoots into their proper positions should be attended to at an early stage of growth. Where the set of fruit is a good one, an early thinning should take place, leaving two or three of the best placed fruits at about equal distances apart on each shoot. A few fruits may be left on the under-side of the trellis, which will form a succession to those more exposed to the sun. After this stage is reached the borders must be kept uniformly moist, and where the trees are aged and have occupied the borders for some years, liquid manure may be afforded at every application of water with advantage to the swelling fruit. Young and vigorous trees in new borders will not require liquid manure until a later stage. When the fruits are swelling freely, a rise of temperature to 60° at night, and 65° to 70° by day, may be afforded. Take the opportunity to ventilate freely on mild sunny days, in order to give substance to the foliage; and fumigate on the first appearance of green-fly.

Melons.—The weather up to the present time has been very unfavourable to the plants, and until warmer nights and sunnier days prevail their progress will be slow. At the same time, where the plants are healthy, and the temperature of the bed of fermenting material is kept up to 75° or 80°, a steady root action will be going on, and this, with the natural rise of temperature, will soon start the plants into free growth. Every encouragement should be given to bring about this condition by keeping the house well damped down, and closing early on sunny days. During dull and damp weather, when but little air can be given with safety, much atmospheric moisture should not be afforded, as it tends to make the foliage tender,

and the probability is that it will collapse before the ripening period is reached. Ventilation requires to be carried out cautiously during cold, windy weather; but every favourable opportunity should be taken to change the air of the house without creating cold currents. A temperature of 70° by night must be maintained, and 10° higher on favourable days. Preparations for a succession crop should now be made by getting the necessary heating material—dung and leaves—into a sweet condition by frequent turning. After this date a selection of young plants should always be on hand ready for planting when and where required.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

Chrysanthemums.—If the stock of cuttings should now be sufficiently rooted as to be fit for potting in large 60's, the work may be forthwith undertaken. If insufficiently rooted the soil has probably become sour, but by carefully shaking them out of it and placing them in fresh soil, a start may readily be induced. In potting cuttings see that the drainage is carefully arranged and covered with some fibrous material, and that the soil is in a fit condition as regards moisture. This can be ascertained by squeezing a handful of it, and if it clings together in a ball it is too wet, and should be mixed with some dry mould and allowed to stand for a day before using. The potting should be done firmly. At this time of year manures are not much needed, and a soil that consists of three parts good loam to one of spent Mushroom-bed dung is rich enough, and may be freely used with heavy loam, and a little of it is good even in light soils. When potted, let the plants be stood on a bed of coal-ashes in pits near the glass, only sufficient heat being afforded as will ward off frost. No water should be applied for a few days, only overhead sprinklings, until the roots become active. During cold weather very little air should be admitted; careless ventilation and easterly winds soon breeding mildew, and any check of that sort is usually followed by attacks of green-fly, very dangerous at this season.

Salvia Heerii and S. Gesneriflora.—These plants, now forming bright features in the conservatory, should never be omitted from a collection of winter flowering plants. At about this date, cuttings of these varieties may be put in; potted off singly when rooted, in May they may be planted out of doors. They will make plants four to five feet high, during the summer season. At the end of the month of September, they may be dug up and potted. They are easily grown, and are not touched by insects.

Phrynum variegatum, may be divided into small pieces, potted in large 60's, and plunged in bottom heat of 80°. Small pieces will often make plants two to three feet high in 48's and 32's, in the course of one season. Grown in light sandy soil, the bold variegation comes out very effectively, making it one of the most useful plants of recent introduction; and unlike *Dieffenbachias*, *Dracenas*, &c., the plant does not suffer by being made use of in apartments.

THE FLOWER GARDEN.

By J. BENSON, Gardener to the Earl of Ilchester, Abbotsbury Castle, Dorset.

Perennials and Biennials.—Any of these plants raised from autumn-sown seeds, as soon as renewed growth is noticed should be dibbled-out where they are to flower in beds and herbaceous perennial borders. The stations, &c., should be suitably prepared by being dressed with fresh loam and manure as may be required. Pansies raised from autumn sowings may now be planted in beds or in the reserve garden, employing fibrous-loam chopped into small pieces as a dressing for the land, and thus ensure their lifting with plenty of roots to which the soil will cling, and receiving no check when they are planted where they are to flower. Selfs should be carefully selected, and those which are found to be true kept by themselves and distinctly named, and the colour indicated on the labels. Seedlings of varied colours make attractive beds; and groups in borders. Pansies struck from cuttings in cold frames in the autumn should be afforded air freely at all times when there is no frost. If damping-off occurs, or mildew is remarked, apply charcoal-powder to the soil. If crowded, transplant them to a warm border, which has been enriched

with finely-chopped turf and spent Mushroom-dung, placing the plants 4 to 5 inches apart, to be lifted with a good ball of earth later on. If the Pansy is required in bloom continuously, sowings should be made thinly in boxes or wide pans. If the stock of plants is not sufficiently large, plants may be dug up, divided, and the rooted divisions pricked out on a bed of rich, porous soil, overlying a very mild hot-bed, covering them with a common garden frame or handlight. They may be planted-out in beds, &c., when well-rooted.

General remarks.—An inspection should be made of the trees and shrubs, and any branches which may have been partly broken off by the recent heavy snowfall should be bound up tightly till the wound heals, badly damaged branches being removed neatly, and the wounds dressed with pitch or lead-coloured paint. Afford the paths and broader walks a sweeping and hand-weeding; roll the turf, and keep every part as neat and trim as the means afforded will allow.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WISART, Bart., Clare Lawn, East Sheen, S.W.

Cypripedium Spicerianum has recovered from the weakening effects of flowering, and may be re-surfaced or re-potted as is necessary. Plants that have sufficient root-room, and are in a satisfactory condition, need only be given a top-dressing, after removing as much of the old surface material as convenient. Those that must be re-potted should be placed in a compost consisting of two parts good Orchid-peat, one part yellow loam fibre, one part of chopped sphagnum-moss, and some old lime mortar, broken into small nodules. If old mortar cannot be obtained, crocks will suffice. Every particle of old potting material should be cleaned away from the living roots of unhealthy plants, and all dead roots be cut away, unless they are necessary to the potting operation. Use pots of medium size, that will not require a large quantity of compost, and rather more than half fill them with drainage material, which for *Cypripediums* in general, should consist of smaller pieces of crock than are employed for Cattleyas, and such species. Cover the crocks with a layer of sphagnum-moss, and fill in with the compost to the level of the rim, but not higher. The base of the growths should be just covered when the operation is completed. Healthy plants need not to be shaken out, but the loose material may be picked away. Place the plants in pots rather larger than those from which they are removed. If division is desired, the operation should be carried out with extreme care, as the roots intertwine much and are brittle. This species may be afforded a position where ample shade can be afforded during the summer months, and where a temperature of 55° to 60° is maintained during winter, to be increased gradually as the season advances. Atmospheric moisture is essential at all times. Re-surfaced plants will not yet need large supplies of water, and those repotted should only be afforded as much as will keep the soil moist until root-action commences. They may be syringed overhead on dry and bright days. *C. Spicerianum*, when employed as the pollen-bearing parent, has given some good hybrids, but it is a bad seed-bearer. The best species in my opinion claiming affinity with the *C. Spicerianum* is *C. Leeanaum*, which thrives under similar treatment and conditions.

Cypripedium insigne may likewise be repotted or top-dressed as is required. Excepting that this species thrives in a lower temperature, there is nothing to add concerning its treatment to what I have written respecting *C. Spicerianum*. Hybrids from *C. insigne* generally appreciate a trifle more warmth, because the other parent was of a more tender character.

Selenipediums, other than *S. caudatum*—which should be attended to in the autumn—may be re-potted or re-surfaced, commencing with those grown in the East Indian house, viz., *S. longifolium*, *S. Roezlii*, *S. x calurum*, *S. x Sodenii*, *S. x leucorrhoda*, *S. x grande*, *S. x nitidissimum*, *S. x Penelaua*, *S. x Perseus*, *S. Lindleyanum*, *S. Sargentianum*, &c. *S. Pearcei*, *S. x Schroderae*, and *S. x Dominianum* grow best in a warm intermediate temperature; and *S. caudatum* and *S. Schlummi* under moderately cool conditions. The pots or pans used should be nearly three parts filled with crocks, and the compost consist of two parts

peat to one part sphagnum-moss. It is an advantage to raise the base of the plant upon a slight mound, on account of the creeping rhizome. Disturbed plants should be sparingly watered for some time afterwards, but when they are rooting freely it is almost impossible to afford them too much. In houses where the atmosphere is inclined to be close, watering overhead should be avoided, but if evaporation is rapid, no harm will result from such a practice.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Manuring Fruit-trees.—This is by no means an unimportant matter in connection with fruit culture. Nourishment may be applied in the shape of decomposed stable or farmyard manure, or by means of artificial manures. When there is not sufficient animal manures for all the requirements of the garden, and the deficiency is made good with artificials, a change should be made the following season by using animal where artificial manure was applied previously. This will afford the trees a change in the food supplied them. In regard to Gooseberry, Currant, and Raspberry plantations, no very serious error is likely to occur in the application of manures; but in the case of Apple and Pear-trees and others, manure should be withheld from those that are barren through making too much wood already. Trees bearing freely need manure to be applied whether the trees are on walls or in the open. Of concentrated manures, bone-meal, dried blood, kainit, superphosphate of lime, and muriate of potash, are all good. The best quality of basic slag is also serviceable, but it is now rather late to apply it. The first two manures may be used in combination for stone and bush fruits. Kainit and superphosphate of lime, when combined, are good for Apples and Pears. The first and the last two named, when mixed together at the rate of 3 lb. of the former to 1 lb. each of the other two ingredients, afford splendid stimulants for fruit-trees, especially those that produce woody seeds, as the Peach, &c. Old hot-bed manure answers well for Raspberries. Wood-ashes are exceedingly useful, and a good dressing may be applied to plantations of fruit-trees of all descriptions.

General work.—As soon as the pruning of trees and bushes is completed, and manure has been wheeled on to and spread about where it is required, the land may be dug, shallow under the bushes and deeper in the middle distance, between the rows, with the exception of the Raspberry quarters. In their case the manure should be spread between the rows and around the stools, after clearing up the prunings and weeds, and the middle spaces dug deeply, so as to afford crumbs of earth to cover the manure. In digging-in manure amongst fruit-bushes, &c., injury to the roots ought to be carefully avoided. When the roots are very near the surface, it is better to remove the surface-soil with a hoe, lay the manure over the roots, and return the soil over it. The Gooseberry sawfly-grub is at times very destructive, and measures should be taken early against it. The following simple plan has been the means of eradicating this pest at Stoke Edith:—The soil beneath each bush is at this date entirely removed to a depth of 3 inches, and buried deeply in a trench in another part of the garden. The bare surface is then heavily dressed with fresh slaked lime, and enough fresh soil, taken from between the rows, is then placed over the lime to make good the deficiency; and the surface of this soil is limed likewise. Remedial measures were also taken when the insects appeared in the summer months, but by following up the liming four consecutive years, the insects were entirely got rid of and have given no further trouble. Alleys in front of the fruit walls should have the surface loosened with a digging-fork to a very shallow extent. At this place it is almost impossible to do more than break up the crust over the roots of Peach, Apricot, and Pear-trees, so near are the roots to the surface. Remove all suckers on the roots of Plums and Peaches, by baring the roots and cutting the suckers clean away with a knife. If an application of artificial manure is to be made, this ought to take place previous to the pricking-up. The borders of the Peach and Apricot trees may be covered with long litter after the crust is loosened. Prune forthwith all newly-planted trees, and secure

them as their requirements may demand. Some object to the pruning of fresh-planted trees, but having given both methods a trial, I am strongly in favour of pruning soon after planting, and thereby establishing a reasonable balance between the roots and branches. If such trees were mulched at the time of planting, a little soil thrown over the same now will keep the mulch in its place. ■

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonsbirt, Tetbury, Gloucestershire.

The Current Season's Crops.—A scarcity of green vegetables seems not to be an improbable event in many gardens, the result of the drought of last summer and spells of mild weather coming between periods of severe frost. Sheltered gardens have suffered the most, and it is only here and there in exposed allotments that plants are to be seen at all, and it is remarked that these mainly consist of Wilcox's, Sutton's Queen, and the later varieties of Broccoli. Cabbage stumps which usually yield a fair supply of sprouts have been killed, and the greater part of the late Brussels Sprouts have rotted on the stems. Up to the present, the autumn-sown Cabbages here have come out well, foremost among them being Nonpareil Improved. The land should now be cleared of decayed Cabbage and Brussels Sprouts stumps, and be deeply trenched and manured. It will be wise to make a large sowing of some early variety of Cauliflower to assist in making good deficiencies. Seakale and Rhubarb-roots in the open ground should be covered, in order to maintain the supply; and Asparagus-roots in sufficient numbers placed in the forcing frames.

Forcing.—Owing to the late frosty weather a more than usual amount of fire-heat had to be used, and this being favourable to the increase of insect pests, clean water and the syringe should be freely used on the plants in the morning hours, and the pavement or ground kept moist in the vicinity of the hot-water pipes. French Beans are very liable to infestation by red-spider, and seldom do well afterwards. Sponging the under parts of the leaves with sulphur made into a thick paste will check the spread of the pest; but it is, after all, better to destroy the plants and sow more seed, and if possible grow the plants in another house. A slight fumigation should be afforded on mild nights in order to check the increase of aphides; and on fine days the amount of ventilation should be increased, so as to afford strength to the stems and leaves.

Tomatos.—Plants that were raised from seed in January will be sufficiently large to be lifted and dibbled into the centre of large thumb-pots, three-parts filled with a light, rich compost, plunging these in a bed having mild heat. As soon as they become established, apply a top-dressing, and place them in a very sunny part of the house. Plants raised earlier than January may now be placed in either new or well-washed 6-inch pots, so that the soil will not cling to the sides when turned out for the final re-potting or planting. Tomatos produce flowers, and set them more freely if the soil consists of fibrous loam, horse-dung, lime-rubble, and $\frac{1}{2}$ -inch bones pressed firmly into the pots. These plants may be stood in a sunny house, and afforded a temperature of from 60° to 70°, with considerable humidity, air being admitted in fine weather. Water at the root should be afforded in moderation till the pots become filled with roots.

Parsley.—If the supply from all sources is getting short, roots may be lifted, and placed in pots or boxes in gentle warmth, and occasionally damped overhead. As soon as the weather and the soil are favourable, seed may be sown out of doors. If the size of the garden will not admit of a large breadth being sown, Parsley may very well be employed as an edging to walks. A warm aspect, and a well-worked, heavily manured, and deep soil, are the chief requirements of Parsley. The drills should not be more than 1 inch deep, nor more than 12 inches apart; and the seeds should be covered with refuse potting bench-soil. The seeds of the Hamburg Parsley, for the production of roots and leaves for flavouring, may be sown in drills twelve inches apart, and about $1\frac{1}{2}$ inch deep in good, but not necessarily heavily-manured soil.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, FEB. 27. { Royal Horticultural Society's Committee (Shrove Tuesday).

SALES.

MONDAY, FEB. 26.—Fruit Trees, Roses, Hardy Perennials, &c., at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at the Putney Nurseries, Dryburgh Road, Putney, by order of Mr. J. A. Mahood, by Protheroe & Morris, at 12 o'clock.

WEDNESDAY, FEB. 28.—Japanese Lilies, Tuberoses, Greenhouse Plants, Continental Plants, &c., at Protheroe & Morris' Rooms.

FRIDAY, MARCH 2.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—49°.

ACTUAL TEMPERATURES:—

LONDON.—February 21 (6 P.M.): Max. 46°; Min. 32°.

Dull—mild—rainy.

PROVINCES.—February 21 (6 P.M.): Max. 50°; S.-W. Ireland; Min., 36°; N.-E. Scotland.

DAVID DOUGLAS.

THE suggested abandonment of the Royal Horticultural Society's garden at Chiswick, naturally revives the recollection of its glorious history. The Chiswick garden was established in 1822, and soon afterwards, and for ten or a dozen years subsequently, the collections made in Western America by DOUGLAS began to pour in.

Nobody, not even Fortune, has conferred so much honour on the Society and so much benefit to horticulture in general, as regards the importation of plants as DOUGLAS. And yet, as we have often noted, there is not a portrait of DOUGLAS in the Lindley Library, not a tablet to his memory in the garden, not a medal instituted to commemorate his services, not an indication that the greatest horticultural collector the world has known was in any way connected with the Society. His fellow citizens at Scone, near Perth, were more mindful of what is due to the memory of our benefactors, and shortly after his death they erected a monument in the tasteless style of the day in the cemetery at Scone. Latterly, this monument has been restored, and we are indebted to the Rev. A. STUART MARTIN for the opportunity of illustrating the monument (fig. 38, p. 121), and of once more calling attention to the labours of this distinguished collector.

DOUGLAS served his apprenticeship at Scone Palace Gardens, and having been trained by Sir WILLIAM (then Dr.) HOOKER, he was sent by the Royal Horticultural Society in 1824 to visit the forests of north-western America. At that time the journey had to be taken round Cape Horn, but he reached his destination in the following year, and soon began his explorations, and made known to his astonished employers the abounding richness of the district in Coniferous and other trees, and in herbaceous perennials. Seeds of the Douglas Fir, *Abies nobilis*, *A. amabilis*, *Pinus Lambertiana*, and

hosts of other plants were sent home; indeed, he is said to have collected eight hundred species, and to have introduced into this country more than two hundred kinds. Returning to England after his first voyage in 1827, he remained at home for two years, when he again set out to visit the Colombia river, afterwards going south to California, where he is said to have discovered no fewer than one hundred and fifty species. In 1831 he went on to the Sandwich Islands, but returned to the Colombia and Fraser rivers. He was wrecked in this expedition, losing his collections, and barely escaping with his life. In October, 1833, he sailed again for the Sandwich Islands, and on July 12, 1834, while exploring the high peaks of the islands, he fell into a pit in which a wild bull had been captured. Several hours later, DOUGLAS was found dead, and terribly mangled. "No other collector," says SARGENT, in his *Silva*, "has ever reaped such a harvest in America, or associated his name with so many useful plants."

DAVID DOUGLAS.
(Died July 12, 1834.)

DOUGLAS' letters, which are full of interest, were mostly published by Sir WILLIAM HOOKER in the second volume of the *Companion to the Botanical Magazine*.

The following is the inscription on the monument:—

ERECTED
BY THE LOVERS OF BOTANY IN EUROPE,
IN MEMORY OF
DAVID DOUGLAS,
A NATIVE OF THIS PARISH,
WHO, FROM AN ARDENT LOVE OF SCIENCE, AND A DESIRE TO
PROMOTE THE IMPROVEMENT OF BOTANY,
VISITED THE UNEXPLORED REGIONS ON THE
BANKS OF THE COLUMBIA, AND SOUTHWARD TO
CALIFORNIA; WHENCE
HE TRANSMITTED A GREAT VARIETY OF THE SEEDS OF
VALUABLE TREES AND FLOWERING PLANTS
ADAPTED TO THE CLIMATE OF GREAT BRITAIN,
AND
WHO AFTER DEVOTING TEN YEARS OF THE PRIME OF HIS LIFE
IN ADDING TO
THE ARBORETUM AND FLORA OF EUROPE
SUFFERED
AN ACCIDENTAL AND LAMENTED DEATH IN ONE OF THE
SANDWICH ISLANDS,
ON THE 12TH JULY, 1834,
IN THE 35TH YEAR OF HIS AGE.

ENDOWED

WITH AN ACUTE AND VIGOROUS MIND,
WHICH HE IMPROVED BY DILIGENT STUDY,
THIS EMINENT BOTANIST
UNFORMALLY EXEMPLIFIED IN HIS CONDUCT
THOSE CHRISTIAN VIRTUES
WHICH INVESTED HIS CHARACTER
WITH A HIGHER AND MORE IMPERISHABLE DISTINCTION
THAN HE JUSTLY ACQUIRED
BY HIS WELL-EARNED REPUTATION FOR SCIENTIFIC KNOWLEDGE.
A DUTIFUL SON,
A KIND AND AFFECTIONATE BROTHER,
A SINCERE FRIEND;
HE SECURED BY
THE RECTITUDE OF HIS MORAL AND RELIGIOUS PRINCIPLES
NOT LESS THAN BY
THE BENEVOLENCE OF HIS DISPOSITION
THE ESTEEM AND REGARD
OF ALL WHO KNEW HIS WORTH.

The following are a few of the numerous trees, shrubs, and ornamental plants introduced by Douglas:—

TREES.	
<i>Acer circinnatum.</i>	<i>Pinus Lambertiana.</i>
— <i>macrophyllum.</i>	— <i>ponderosa.</i>
<i>Amelanchier florida.</i>	— <i>nobilis.</i>
<i>Arbutus procera.</i>	— <i>amabilis.</i>
<i>Crataegus Douglasii.</i>	— <i>Menziesii.</i>
<i>Pinus Douglasii.</i>	
SHRUBS.	
<i>Berberis aquifolium.</i>	<i>Ribes sanguineum.</i>
— <i>glumacea.</i>	— <i>speciosum.</i>
<i>Garrya elliptica.</i>	<i>Rubus spectabilis.</i>
<i>Gaultheria Shallon.</i>	
ANNUAL, BIENNIAL, AND PERENNIALS.	
<i>Clarkia pulchella.</i>	<i>Gilia tricolor.</i>
<i>Olinthia elegans.</i>	<i>Nemophila insignis.</i>
<i>Collinsia grandiflora.</i>	<i>Ipomopsis elegans.</i>
<i>Lupinus polyphyllus.</i>	
<i>Eschscholtzia californica.</i>	
<i>Douglasia nivalis.</i>	
&c. &c. &c.	

At Honolulu, upon either side of the doorway or entrance to the Kawaiahae Church in Honolulu, the passer-by, says a writer in the December number of *Erythea*, may see tablets set in the wall. One of these is in commemoration of DAVID DOUGLAS, the botanical explorer, who met, after leaving California, a tragic death on one of the Hawaiian Islands. The inscription upon the tablet reads as follows:—

Hic jacet
DAVID DOUGLAS,
Scotia anno 1799 natus:
qui
indefessus viator,
a Londinensi Regia Societate
Horticulturali missus,
in Hawaii saltibus,
die 12 Julii A.D. 1834
victima scientiæ
interiit.
Sunt lacrymæ rerum, et mentem mortalia
tangunt. Verg.

ENCEPHALARTOS HILDEBRANDTI (see Supplementary Illustration).—No nobler plants than Cycads can be found for the decoration of warm-houses big enough to hold them. Apart from the magnificence of their appearance, there are few plants of greater interest to those concerned in structural botany, or in the history and descent of living plants from prehistoric representatives, whose remains are embedded in oolite rocks. No nobler collection can be found than that in the Palm-house at Kew. Our supplementary illustration is taken from a plant in that house, bearing seven male spikes. *E. Hildebrandti* was discovered in Zanzibar by HILDEBRANDT, and was introduced to this country by Mr. WILLIAM BULL in 1878. The leaves, well shown in our illustration, are covered when young with whitish woolly down, but the adult leaves are glabrous. The species was described by ALEXANDER BRAUN in the *Index Seminum*, or Seed List of the Berlin Garden, in 1874.

LINNEAN SOCIETY.—On the occasion of the meeting to be held on Thursday evening, March 1, 1900, at 8 P.M., the following papers will be read: I. "On Botanic Nomenclature," by Mr. C. B. CLARKE, F.R.S., F.L.S., &c. II. "On some

Foraminifera of Tithonian Age from the Limestone of Nesseldorf," by Mr. F. CHAPMAN, A.L.S., &c.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Flower Committees of the Royal Horticultural Society will be held on Tuesday, February 27, in the Drill Hall, James Street, Westminster, 1 to 4 P.M. A lecture on some of the plants exhibited will be given at 3 o'clock, by Professor G. HENSLOW, M.A., V.M.H. Intending candidates for the Royal Horticultural Society's examination in horticulture on April 25, 1900, may obtain all particulars from the Secretary, 117, Victoria Street, Westminster.

THE GARDENERS' ORPHAN FUND annual meeting was a most satisfactory event, and showed a financial condition that supporters of the Charity may well be proud of. We quite agree with the committee in determining to meet all claims for benefits, so long as they can at the same time increase the Reserve Fund. It was never intended to hoard an immense fund for use in the future, by practising a policy of niggardliness in respect to present needs. That the meeting decided to place upon the Fund as members, five candidates in addition to the nine that were elected in the ordinary course, will doubtless encourage everyone to help to maintain the finances in such a condition that future needs may be met as they arise. At any rate, it will be satisfactory to subscribers to know that the money they may give will be used at once for the purpose they intended. The interest upon the Fund's capital is now sufficient to pay all the expenses of administration. We regret that Mr. WILLIAM MARSHALL has to retire from the position of Chairman of the Executive Committee. Mr. MARSHALL has rendered such excellent services to the Institution that he will be greatly missed in the Committee.

CAPTAIN H. CECIL ELWES.—We are glad to hear that this gentleman, who was severely wounded, has made an excellent recovery, and hopes to rejoin his regiment (Scots Fusiliers) in a few weeks.

MR. JOHN LAING, V.M.H., head of the firm at Forest Hill, is in his seventy-seventh year, and has been confined during the winter, more or less, to his residence, through impaired health. It is hoped, however, that he will be able to get about when the influences of spring have improved the weather.

DR. ERNST.—We learn from the *Botanisches Central Blatt* of the death of this veteran botanist, the Director of the National Museum in Caracas, Venezuela. In former years, Dr. ERNST was a correspondent of this journal.

DR. ROBINSON, the Curator of the Gray Herbarium, at Cambridge, Mass., U.S.A., has been appointed Professor of Systematic Botany in Harvard University. The new Professorship has been endowed in memory of the revered ASA GRAY.

DR. FARLOW.—The marriage of Prof. FARLOW, of Harvard University, to Miss LILIAN HORSFORD is announced. Prof. FARLOW's many friends on this side of the Atlantic will join in congratulating him.

MR. OWEN THOMAS, head-gardener to HER MAJESTY at Windsor, has received the Royal Order of the Crown of the Fourth Class from the GERMAN EMPEROR.

THE POTAMOGETONS OF THE BRITISH ISLES.—Mr. ALFRED FRYER has issued, through LOVELL, REEVE AND CO., parts 7 to 9 of this publication. It is handsomely got up, carefully and thoroughly elaborated, and well illustrated. To students of this not over popular group of plants, this monograph will be invaluable. It is too late to make the alteration now, but it would have been better had the name of each species or hybrid been given on each plate as well as in the text.

STREPTOCARPUSES are fast becoming popular garden plants. Since the species have been crossed with each other, several very beautiful strains have been obtained, all of which are exceedingly free and continuous bloomers. We saw a few days ago, in the greenhouses of Messrs. JOHN LAING & SONS, Forest Hill, London, a very large number of healthy-looking plants of their "multiflora" strain, that later will make a magnificent show of bloom. The *Streptocarpus* is an easily grown plant that requires little heat, and it responds to good cultivation by affording an extraordinary number of flowers. It is ornamental as a plant, and its blossoms are suitable for cutting.

FIG. 38.—MONUMENT TO DAVID DOUGLAS, IN THE PARISH CHURCHYARD, SCONE, PERTHSHIRE, N.B. (SEE P. 120.)
(The Monument has been renovated recently.)

THE DIXLOR WASH.—A wash for trees, &c., was brought to our notice in the course of last year, which we entrusted to an experienced cultivator to test for us, and the following embodies his opinion of the insecticide: "The 'Dixlor Wash' which you kindly sent to me to test was tried upon *Chrysanthemums*, which were allowed to become badly infested with both black and green aphids, with the result that the green aphides were killed with one dressing, but the black one needed three applications to thoroughly eradicate them. I used it in the proportions given, and found no injury was caused to the leaves of the plants. Probably one dressing afforded of greater strength, would kill black fly outright. Up to the present time, no black aphid has made its appearance; but a stronger application might cause injury to the foliage."

THE YORK GALA.—The schedule of prizes to be offered for competition at the forthcoming Horticultural Fête to be held in the Bootham Field, York, on June 13, 14, and 15, is a very liberal one. The sum of £750 is divided by the committee as follows:—For Orchids, Stove and Greenhouse Plants, £300; Pelargoniums, Carnations, and Begonias, &c., £200; Roses, Cut-flowers, &c., £160; and Fruits and Vegetables, £90. Four Gold Medals also will be awarded to the best exhibits from members of the trade. Groups of plants are generally a very fine feature of the York shows. We see that the sum of £58 is offered for competition in the miscellaneous group class this season; the 1st prize is £20. For a collection of Roses in pots a 1st prize of £10 is offered, and liberal 2nd and 3rd prizes. The class for a decorated table of ripe fruit, originally introduced into the shows at Shrewsbury, is becoming a popular one with many societies. At York, a sum of £40 is offered for such exhibits, the 1st prize being £15. Special prizes for vegetables are offered by several of the large seed firms. The Secretary is Mr. CHAS. W. SIMMONS, The York Hotel, York.

THE "HABIT" OF CONIFERS.—Every gardener is familiar with the striking differences in habit presented by different Conifers. Leaving aside minor details, it may be said that the differences depend, in the first instance, upon the presence of one main axis (trees), or on the formation, as in plants of shrubby habit, of numerous axes of about the same size, no one of them being specially predominant. Dr. ARTHUR BURTT, a pupil of the University of Tübingen, has, in his inaugural dissertation for the doctor's degree, studied the matter in greater detail, notably in the investigation of the relative lengths and proportions of the secondary shoots, and in the observation of the angles formed between the main axis and the secondary shoots, and those between the shoots and the ground line.

THE "JARDIN DES PLANTES."—We have received a copy of the list of seeds collected in the gardens of the Museum at Paris, and available for exchange. Applications should be made to M. le Directeur du Museum d'histoire naturelle, Rue Cuvier, 57, Paris.

THE NEW FORESTRY.—Mr. JOHN SIMPSON, late of Wortley, has published his book on this subject. Messrs. PAWSON & BRAILSFORD, of Sheffield, are the publishers. It is an 8vo volume of over two hundred pages, with numerous illustrations. The author believes that our forestry system in the past has been the main cause of failure and disappointment in the production of timber crops, and that a more intelligent system might alone turn the scale in the right direction. We have no doubt our system, if it may be so called, is of the usual happy-go-lucky order, and that the adoption, so far as may be suitable, of the more scientific and business-like methods adopted by the Germans, and advocated by the author, would be of incalculable advantage in the long run. We shall revert to Mr. SIMPSON's book on another occasion. In the meantime, knowing Mr. SIMPSON's capabilities, we need not hesitate to recommend his book even before we have examined it in detail.

FRUIT FROM THE CAPE.—During last month there were several arrivals from the Cape, per the Union line, the first, per the *Dunvegan Castle*, a small consignment of Peaches, which sold well. The second, per the *Guelph*, was twelve cases of Peaches, in fine order, which sold well. The third ship was the *Norman*, with 704 cases of fine Plums, and 33 of Peaches. There was a splendid bloom on the Plums, all of which were quickly taken off, at good prices, as also were the Peaches. *Tantallon Castle*, arrived on the 3rd inst., brought 392 cases of Plums, 141 cases of Grapes, and 138 cases of Peaches. Plums, some were "Simoni," large red, in good condition, boxes of 24 running up to 12s. per

box. Others were Golden Drop, fair sized yellow, also in good condition, going as high as 12s. per box of 24. Grapes were small, and slightly hard. They were the first consignment of the season, and must have been picked too early. They were practically given away at Covent Garden, 2d. per pound being the highest price. This shows that care must be taken to send home only fruit in good condition and thoroughly ripe. This lot of Grapes were brought home by a passenger who must have little knowledge of the trade. Peaches: some were in capital condition, running up to 12s. per box of 24. N.B.—All the above fruit was sold privately at Covent Garden, not by public auction. Some Peaches were sold at public auction, and although first class fruit realised very low prices. The result does not seem to recommend the public auction sales. The last arrival to note here is that of the ss. *Mexican*, which arrived on Sunday, 11th inst., bringing 196 cases of Peaches, 290 boxes of Plums, 102 boxes of Nectarines, and 60 boxes of Grapes.

"THE BIRDS OF SURREY."—Mr. J. A. BUCKNILL announces the early publication, through Mr. R. H. PORTER, 7, Princes Street, Cavendish Square, London, of a work on the "Birds of Surrey." It will consist of an introduction divided into two parts; one giving an account of the geographical and natural features of the county so far as they relate to ornithological distribution; the other dealing with what has already been published in connection with the Avi-fauna of Surrey, together with some account of the early local ornithologists. Following the introduction will be detailed a complete account of every species of bird which has occurred in the county, coupled with remarks on the distribution of the commoner, and every detail of the occurrence of the rarer species. The various attempts at the introduction of foreign birds, the ancient duck-decoys, hawking, game preservation, freaks of colour, the causes leading to the diminution of more uncommon species, and the legal effect of the Wild Birds' Protection Act, will also be dealt with. A complete index, a map of the county, a glossary of local names, a list of the works and periodicals consulted in the compilation of the work, a list of the subscribers, illustrations of county localities, and full-page photogravures of six of the most interesting ornithological places in Surrey, will also be included in the volume.

NARCISSUS SIR WATKIN.—The Orchard Company, Scotby, near Carlisle, send us a specimen of this Narcissus, in which the edge of the cup is reflexed and much lobed, almost fringed at the edge. Possibly the appearances may be due to some check to growth.

YEOMANRY FOR THE FRONT.—The nursery trade is well represented in the patriotic offers for service in the field. The latest additions to the Hampshire Yeomanry include the names of Mr. JESSE BIDE, Mr. ERNEST BIDE, and Mr. BERTRAM CRABBE. The first-named being the youngest son, and the two latter nephews of Mr. SAMUEL BIDE of the Alma Nurseries, Farnham, Surrey. Mr. B. CRABBE left on board the *Goth*, and the others wait embarkation orders. Mr. C. C. HURST, a member of the well-known nursery firm at Burbage, Hinckley, is already serving at the front.

THE GALE IN THE NORTH.—A hurricane, the like of which has not been experienced in the north since the memorable night of the Tay Bridge disaster, swept over the N.E. of Scotland on Thursday evening and Friday morning, 15th and 16th inst., doing considerable damage. Especially had this been the case in the Methlic Woods, Aberdeenshire, on the estate of the Earl of Aberdeen.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the lecture-hall of the Institution on Monday, Feb. 26, 1900, when the adjourned discussion on the paper read at the last meeting by Mr. H. T. SCOBLE (Professional Associate), entitled "The Bacterial Treatment of Sewage," will be resumed. The

chair will be taken at eight o'clock. It has been decided, on the invitation of the Yorkshire Provincial Committee, to hold the next county meeting at Leeds, on April 25 and 26. The first day will be devoted to papers and discussions, with a dinner in the evening; the second day to excursions to various places of interest in Leeds and its neighbourhood. Full particulars will be issued a little later on.

A SALUTARY REFLECTION AND A GOOD RESOLUTION.—At the friendly dinner which followed the recent meeting of the Royal Gardeners' Orphan Fund, Mr. ASSBEE said that a gardener who is married and has children should reflect—"If I live to old age, I may require assistance from the Gardeners' Royal Benevolent Institution. If death overtakes me earlier, my children may need the help of the Orphan Fund." "Such a reflection," said Mr. ASSBEE, ought to induce any gardener to resolve that he will subscribe to both funds." We think so too.

SOCIETY FOR THE PROTECTION OF BIRDS.—The annual general meeting of the above society will take place on Monday, February 26, 1900, at the Westminster Palace Hotel, Victoria Street, S.W. The chair will be taken at 3 P.M. by the Most Hon. the Marquess of GRANBY.

PUBLICATIONS RECEIVED.—*One and all Gardening*, 1900; a popular annual for amateurs, allotment-holders, and working gardeners. Edited by E. O. Greening (Agricultural and Horticultural Association, Long Acre, W.C.).—*Nature Notes*, February (John Bale, Sons, & Danielsson, Great Titchfield Street).—*Anne Pratt's Flowering Plants*, vol. iv., Nos. 33 and 34. Edited and revised by Edward Step, F.L.S. (Frederick Warne & Co., 15, Bedford Street, Strand).—*The British and Colonial Druggist*, February 2 (44, Bishopsgate Without, E.C.).—*The Theory of Water Finding by the Divining Rod*. By B. Tompkins (published by the author, Chippenham, Wilts.).—*The Orchid Review*, an illustrated monthly journal, devoted to orchidology, February (Marshall Brothers, Kewick House, Paternoster Row, E.C.).—*Garden Lawns, Tennis Lawns, Putting Greens, Cricket Grounds*. By Sutton & Sons, Reading (Simpkin, Marshall, Hamilton, Kent & Co., London).—*Woman's Agricultural Times*. Edited by the Countess of Warwick, February (Lady Warwick Hotel, Reading; Messrs. John Haddon & Co., Bouverie House, Salisbury Square, E.C.).—*Tropical Agriculturalist*, January (A. M. & J. Ferguson, Colombo).—*Queensland Agricultural Journal*, vol. v., part 6, December.—From the Department of Agriculture, Sydney, N.S.W., Miscellaneous Publication, No. 282, *Native Food-Plants*, by J. H. Maiden; and No. 351, *A Second Contribution towards a Flora of Mount Kosciusko*, by J. H. Maiden.—*Bulletin of the Botanical Department, Jamaica*. Edited by W. Fawcett, B.Sc., F.L.S., December.—*Indian Gardening*. Edited by H. St. J. Jackson, F.L.S., Calcutta, January 18.—*La Semaine Horticole*, Feb. 8 (Brussels).—*Catalogue des Plantes Economiques pour les Colonies, arbres a fruits des Tropiques, plantes utiles, officinales, medicinales, et autres Vegetaux precieux pour les Colonies de "L'Horticulture Coloniale"* (Parc Leopold, Brussels, Belgium).—*Annales Agronomiques*, January 25 (Paris: Masson et Cie., 120, Boulevard Saint Germain).—*Notice sur l'Exposition Centennale et l'Exposition Contemporaine de 1900*. Par A. de la Devansaye (Paris: Octave Doyn, 8 Place de l'Odéon).—*Liste des Graines offertes par le Jardin Alpin d'Acclimatation* (3, Rue Dancet, Plainpalais, Geneva); H. Correvon.—*Müller's Deutsche Gärtner-Zeitung*, Erfurt, February 8.—*Botanische Zeitung*, title-page and index for 1899, and the issue for February 1 (Leipzig).—*Gartenflora*, February 1 (Berlin: 46, Schönebergerstrasse).—*Rosen Zeitung*, December. Redigiert von P. Lambert, Trier-a-Mosel (published at Frankfurt-a-Main).—*Mitteilungen der unter dem Protectorate ihrer k. u. k. Hoheit der durchlauchtigsten Kronprinzessin-Witwe Frau Erzherzogin Stephanie stehenden K. K. Gartenbau-Gesellschaft in Steiermark*. February, 1900.—*Botanisches Centralblatt*, Band lxxxi., Nos. 5 and 6.—*Moor und Alpenpflanzen* (vorzugsweise Eiszeitflora), des Alpengartens Zöschel bei Merseburg und ihre Cultur. Dr. C. Dieck (Druck und Verlag von Ehrhardt, Karras in Halle-a-S.).—*Wiener Illustrirte Garten-Zeitung*, January (Wien K. und K. Hofbuchhandlung der Wilhelm Frick).—*Thirty-seventh Annual Report of the Secretary of the State Board of Agriculture of the State of Michigan, and Eleventh Annual Report of the Agricultural College Experiment Station*, July 1, 1897, to June 30, 1898. Containing a valuable paper on "Some Insects of the Year 1897," by W. B. Barrows and R. H. Pettit.—*Nuovo Giornale Botanico Italiano*, vol. vii., No. 1. Gennaio, 1900.—*Bullettino della Società Botanica Italiana*, November-December (Firenze).—*Our Patent Laws*, by James Keith, C.E. Revised to suit the present situation, with an additional article on "American Competition," closely bearing on the subject.—*The Gardening Year Book and Garden Oracle*, 1900. By the Editor of the *Gardeners' Magazine*. This is the forty-second annual issue of this useful publication (*Gardeners' Magazine Office*, 4, Ave Maria Lane, Paternoster Row, E.C.).—*Willing's Press Guide and Advertisers' Directory and Handbook*, 1900. Twenty-seventh year of the publication of a work invaluable to all connected

with journalism (J. Willing, 125, Strand, W.C.).—*The Agricultural Journal of the Cape of Good Hope*, vol. xvi., Nos. 1 and 2, for January 4 and 18 (Cape Town: Townsend, Taylor, & Snashall).—*The Botanical Gazette* (Chicago, Illinois). Contains articles on: The Mechanism of Root Structure (with figure), by James B. Pollock; Botanical Bibliography, by W. G. Farlow, and other less important papers.—*Le Mois Scientifique*, publié sous la direction du Professor H. Girard (Bureaux de la Revue: Librairie J. B. Baillière et fils, 10, Rue Hautefeuille, Paris), February, 1900.—*Journal de la Société Nationale d'Horticulture de France*, with portraits of several of the Presidents, January (Paris: 84, Rue de Grenelle).—*Gartenflora*, February 15 (Verlag von Gebrüder Borntraeger, 40, Schöne -Vergersstrasse).—*Gärtnerisches Zentral-Blatt*, December, 1899 (Charlottenburg, Berlinerstrasse, 88, a.).—*Phanerogamie et Pteridophyte Japonicae Iconibus Illustratae*; or, *Figures with Brief Descriptions and Remarks of the Musci, Hepaticae, Lichenes, Fungi, and Algae of Japan*. Edited by J. Matsumura and M. Miyoshi (Tokyo, 1, Urazimbocho, Kanda), December 29, 1899.—*Bullettino della R. Società Toscana di Orticultura*, Gennaio, 1900.

BOOK NOTICE.

THE TEACHING BOTANIST, ETC. By W. F. Ganong. (Macmillan & Co.)

We are not ashamed to own that we are wearied with the profusion of elementary books on botany. Good, bad, and indifferent, there are far too many of them. The book before us, which is also entitled "A Manual of Information upon Botanical Instruction," is so novel in its treatment, so fresh in its matter, and so full of useful suggestion, that it acts as a bracing tonic after the surfeit of characterless books.

In the first place, it is addressed mainly to the teacher, not to the pupil, and dull must that teacher be who does not profit in some way by this outspoken book.

Man, says the author, has attained the position he has in the world through the possession of one supreme characteristic—mind. The purpose of education is to enable the possessor to make the best use of this great endowment. "Of all the many problems of education, the one nearest to the surface is this—to determine the proper balance between mind-training pure and simple and the training of the mind for the practice of a particular business." The schemes of education generally followed, the too exclusive study of one or two ancient languages, or of mathematics, find little sympathy with the author. Admitting the different requirements of different minds, he yet sees that in the near future the sciences must be elevated to full educational rank with any and all other subjects. So far as botany is concerned, the author asks, What botany is of most worth? And he answers that question by telling us that no one part is more important than any other, but that in teaching, selection becomes imperative, and it is necessary to find out what will give the best returns for the time and energy expended.

The very foremost thing is exact observation, and for training in observation anatomy, dealing with actual structure is the best possible discipline. By anatomy Prof. Ganong here means external morphology. This is shown by the example he gives devoted to the outward appearance of seeds, such as that of the Bean or Horse-Chestnut. These are taken as subjects for the first lesson wherein the pupil is made (with, in the first instance, but little help from the teacher) to investigate for himself the general appearance and conformation of certain conspicuous seeds.

After observation, the Professor puts critical comparison and generalisation, so as to enable the student to eliminate what is relatively unimportant, and grasp that which is essential. For this purpose nothing is better than morphology as studied in the investigation of the shoot, root, flower, and fruit of the higher plants.

Causation comes next in importance: the pupil must not only see and observe that a leaf has a particular shape or position, but he must be perpetually seeking the reason why. Here the great value of experiment comes in, "There is nothing

in botany to equal simple physiological experiment on such topics as respiration, photosynthesis, absorption, geotropism, where the object of the experiment is perfectly distinct, and the results obtained are positive and logically conclusive.

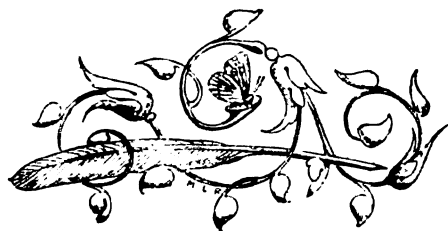

A third chapter deals with the things essential to good botanical teaching, the main point being the ability and sympathetic endowments of the teacher himself.

Scientific drawing and descriptions next receive the attention they merit. The equipment of laboratories forms the subject of the fifth chapter, which is followed by others dealing with botanical collections and botanical books.

A valuable section is that devoted to "some common errors prejudicial to good botanical teaching." Foremost is the notion that botany is synonymous with the study of flowers. The author also objects to the notion that anthers and carpels are modifications of leaves, because both the anther and the ovule are sporangia. What then? Are not the sporangia developed in leaves which are adapted for the purpose?

The second part of the book comprises a series of exercises and studies to be worked out in the laboratory, and does not materially differ from the directions given in other books of similar character, unless in the greater stress laid on "Ecology," or the study of the adaptations of flowers, &c., to external conditions.

We cannot further follow the author in his statement of his case, but we recommend all thoughtful teachers to read the book for themselves.

HOME CORRESPONDENCE.

THE PROTECTION OF FRUIT BLOSSOM ON WALL-TREES.—It is many years since it was pointed out in the *Gardeners' Chronicle* and other journals that during the winter and early spring our stove and other fruit-trees and bushes need protection from sun-heat rather than from cold. Given well-ripened wood, the cold of an ordinary winter does no harm to the closed buds. And yet the common practice is to keep our wall fruit-trees in a position on a wall in winter and spring exposed to the extremes of heat and cold. Mr. Sharpe's simple expedient of unailing the young wood from the walls may retard the blooming of Peaches, Nectarines, Apricots, Pears, Plums, and Cherries (see *Gardeners' Chronicle*, p. 92), for about one month, means usually a crop of fruit saved, and the health, vigour, and cleanliness of the trees maintained. Long experience among fruit-trees enables me heartily to support Mr. Sharpe's methods. In fact, I have often gone further on the same lines, through practically removing them from their hot environments against brick walls, with equally good results. The cooler the trees are kept during the winter, the greater certainty of a crop the coming season. I agree with Mr. Sharpe that the fish-net let drop from the coping to the ground, affords but little protection against frost and sunshine. I have no wish to set your correspondent against it, as I have found a multiple thickness of fish-nets very effective. Another detail, too, the pruning of the young wood in the first week in February might be objected to, and not a few growers might think it safer if training and pruning proceed together at a later date. Mr. Sharpe's easterly trend in his south Peach wall doubtless helped him in ensuring good crops by giving the wall a less warm aspect. The unailing of Peach and Nectarine trees to promote dormancy till a late date in the winter often been carried very much further than is

recommended by your correspondent. Strong stakes have been driven in 3 or more feet from the walls, and the trees removed and secured to them. To do this afford the trees a steady, regular temperature through the winter. This method affords facilities for cleaning the trees and walls of insects, and provided the wood is well matured and the trees are unailed soon after the fall of the leaf, I have never known it to be injured by frost. D. T. F.

THE QUINCE IN SUSSEX.—It is pleasing to note that Dr. Bonavia is again to the fore; ever thoughtful in his endeavours to enlarge the number of our national home industries, some of which, he thinks, if they received right and proper attention, might be made lucrative in a larger or a lesser degree. A while ago, it was our vineyards that should be "seen to." Now it is the Quince which, he assumes, may easily be turned into a profitable channel by the simple process of making Quince cheese. Nor is he by any means wrong in this respect, saving and excepting that he seems to be unaware that it is a product that has been made in Sussex and Kent, though to a limited extent only, from time immemorial. Thus there is no need whatever to send to Italy for a Quince-cheese, or what is there termed "cotognata" maker, for so long as I can remember, which is over three-score years and ten, it has been one of our most valued and delicious of farm-house condiments, though not made of the dimensions given by the genial Doctor. They, the cheeses, being mostly of what is termed the small gallipot size, for the reason that when fresh from the jar, mould, or jam-pot, there is or should be a delightful aroma which also adds to the piquancy of the flavour, which by exposure becomes flat, and is lost; therefore, when used as a part of the dessert, the cheese should be "fresh and fresh." Nor is this all, for if a small "cheese" is divided into lozenges or cubes, and one or two allowed to dissolve on the palate, it is a remedy exceedingly helpful in soothing the ordinary sore throat. The making is easy. The fruit is gathered ripe and dry; it is carefully wiped, cut small, and put into a copper jam-pan or skillet. It is then, unless very juicy, just covered with warm water, and allowed to simmer gently; after a short time, a pound of sugar to each pound of fruit is added (some prefer less), when again more simmering, until the pulp and juice become somewhat red, when the whole is taken out and strained through a very fine hair-sieve. This done, the thick juice is put back into the stew-pan, and simmered until it becomes thick, when it is at once removed from the fire and poured into different-sized gallipots, shallow jam-jars, and earthenware moulds or shapes. Then all are put in an airy place, and when perfectly cool, are covered with paper. In about two months it is fit for use, yet will improve in density and flavour for at least twelve months, and even more—some of my own has been kept nearly two years. Also from the Quince is made an elegant and tasteful jelly, which may be used for flavouring, or eaten *au naturel*. And what is nicer, when properly made, than Quince marmalade, with a slight admixture of the Seville or Tangerine Orange! Truly, Dr. Bonavia is right. There ought, there should be, and, as a novelty, there must be, the germs of a profitable home industry in the making of Quince cheese, jelly, jam, and marmalade. But the fact must not be overlooked that the practical and busy housewives of Kent and Sussex are equally commendable for their excellent and most enjoyable Damson and Bullace cheese, and these, equally delicious with the former without any doubt whatever, should all take a high place among our "old time" luxuries. Why is it that the Bullace is now so seldom grown? In my younger days no southern farm, homestead, "plantings," or orchard, was thought complete without at least one Quince-tree, two or three Bullace bushes, and the same of Damsons, and these mostly about the banks or hedgerows. Even in the gardens either in bloom or fruit they were thought by "the old folk" to be pretty. Though somewhat digressing, perhaps I might be allowed to say this—furthermore, formerly a kind of essence or preserved juice of the Quince was made, and used with water as a summer-drink, in the same way as Raspberry-juice or vinegar; also, there was a wine made from Sloes, of which the jovial tillers of the soil used to say that it was an excellent substitute for port, while with others it was called Rough Robin. Why the last name I know not. And yet another "wine" was made from the tendrils of the

Grape-vine gathered young, macerated in water with sugar, and some spirit added, mostly brandy. This was said to be "a very pretty drink." As regards myself, some fifty years since I tasted it once, and being satisfied, have not enquired about any since. But in bygone times, they of the farm and homestead had many dainties this age wots not of. Harrison Weir.

POT-BOUND ANTHURIUMS.—Many plants continue to flower abundantly, though they are pot-bound, if supplied with moisture and other requirements. We have found no plant do better than *Anthurium Scherzerianum*, and its varieties. We have some old plants in capital health, full of vigour, which have not been shifted for some ten or a dozen years, but each season they have flowered profusely from February until August. They have been given a surface-dressing with bone-meal and fibry peat before flowering each year. Some varieties of *Cypripediums* and *Cymbidium*s have also succeeded with us under similar treatment. They may be watered liberally under such conditions without fear of doing damage to the roots, but neglect of same is most injurious. W. Temple, Carron, N.B.

THE NOMENCLATURE OF HARDY PLANTS.—Now that nurserymen are about to send out their new catalogue of hardy plants, it is the time to say a few words on this subject. The orthography and authenticity of the botanical names and synonyms hardly meet with the attention they deserve on the part of the compilers of these catalogues. It would be a great help to amateurs who wish to have their collections correctly named if nurserymen would consent to adopt some uniform standard of naming, and this standard is already provided for them at a reasonable cost by the official *Key Hand-list of Herbaceous Plants*, to be obtained free by post for 1s. 3d. from the Royal Gardens, Kew. This hand-list may be said to include, with few and rare exceptions, every hardy plant in cultivation in England, and has been carefully prepared and corrected up to the date of publication under the instructions of the director of Kew. The names, both of the genera and the species, are arranged in alphabetical order, and the instances in which a species is to be written with an initial capital letter are all observed in printing. In one particular this catalogue is in advance of *Index Kewensis*, namely, that it limits the use of initial capitals for species: (1), to names which have either been names of a former genus now absorbed in a newer genus, or to old classical plant names which are added as (3), nouns in apposition with the present name of the genus, and (2), to substantive proper names, whether personal or geographical. Formerly, as in *Index Kewensis*, adjectives derived from personal names, when given to species, were printed with an initial capital, a privilege from which geographical adjectives used as specific names, were excluded: but the director of Kew has adopted the rule as stated above, which is more consistent and simple. Examples:—

<i>Inula Hookeri</i>	<i>Crocus Tauri</i>
<i>Hypericum hookerianum</i>	<i>Onosma tauricum</i>

A. Wolley Dod, Edge Hall, Malpas.

GROS GUILLAUME GRAPES.—This once popular Grape is not valued much while others of easier culture and of prolific habit are so common; but the beautiful foliage is much appreciated in many establishments for table-decoration, and for this reason the Vine is often cultivated. I once supplied a large boxful of blooms of *Lapageria* roses and *L. r. alba*, accompanied with small foliage of the Vine indicated, to a lady for decorative purposes for a table where a large company was to dine. There was a charming centre-piece, but the great attraction was a scroll of the two *Lapagerias* intermixed lightly with Ferns placed in glasses resting on the Vine-leaves. I have seen much of this class of work in many mansions and in public halls, but on no occasion have I seen decorative table work so much to my mind. Its simplicity seemed so different from table decoration as it is usually carried out, with heavy and crowded designs that are not always pleasing. The lady referred to did the work herself with the aid of a man-servant. By reason of these pleasant recollections, I have put some value on the Vine indicated. The bunches of this Grape when long and tapering, with berries equal in size, and with fine bloom, are graceful on a table where there is a well-appointed dessert. M. Temple, Carron, N.B.

A SNOW-STORM IN IRELAND.—A snow-storm of unusual severity for this part of Ireland, I am told, fell on the 9th and 10th inst. The depth of snow on the plain was about 7 inches. Drifting has taken place, and the roads in many places were impassable. The snow-storm was followed by severe frost. *D. Brough, Coolattin Gardens, Shillelagh, Co. Wicklow, February 13, 1900.*

LARGE CEDARS OF LEBANON.—On p. 106 of the *Gardeners' Chronicle*, reference was made to these noble trees, from *Transactions of English Arboricultural Society*, vol. iv., part ii. "Dimensions were given of different trees, the one growing at West Wycombe being stated to have a quarter girth of 71 inches, or nearly 24 feet at 5 feet in circumference from the ground, the largest Cedar ever seen by any arboriculturist present when the trees were inspected last August." It may interest those gentlemen, or other readers of these pages, to learn that at Goodwood may be seen, without doubt, the finest specimen in the country. It has one clean stem, the girth at 5 feet from the ground being no less than 29 feet 6 inches. At this point, however, it is where the massive limbs commence to divert from the stem. The smallest measurement of the latter taken at 3 feet from the ground, exceeds 25 feet 11 inches. The height is rather more than 100 feet; spread of branches 130 feet. This specimen, together with many others, was planted in 1760. *Richard Parker, Goodwood.*

CRINUM MOOREI ALBUM OR SCHMIDTII OR MAKOYANUM.—The *Crinum* represented on fig. 29, p. 98, of last week's issue of the *Gardeners' Chronicle* is undoubtedly the three-named variety above mentioned, and not, as the sender of the photograph believes, *C. capense*, which is better known as *Amaryllis longiflora*, and is a far inferior plant in beauty to what is here figured. I grow the above-named plant in quantity in the greenhouse, but do not consider *C. capense* worth growing at all. *W. E. Gumbleton.*

CHANGE OF POTATO SETS.—My experience convinces me that Potatoes do not crop well when we continue to plant sets from our own gardens for a longer period than four or five years. The fact is, the Potato, like many other plants, degenerates, and subsequently the tubers become small and the crop consequently light. The only way to remedy these evils is to procure sets from a different quarter and soil, the farther away the better, that is if it be wished to grow the same varieties, and we cannot afford to dispense with some of our older varieties, these being better in every way than the new. I would advise everyone to buy in each year two or three novelties, and test them; and if these are suited to the soil, then it is an easy matter to increase the stock. Such varieties as *Rivers' Ashleaf*, *Early Ashleaf*, *Early Rose*, and *Windsor Castle*, will require something very good indeed to oust them from our gardens; although among the newer ones, I find *Sutton's Ninety-Fold*, *Sutton's Seedling*, and *Early Puritan* are excellent varieties. *A. J. L., Wyfold Gardens, Reading.*

APPLES, ETC., AT SHERBORNE CASTLE.—On p. 60 there was published a note by Mr. Turton on *Newton Wonder* and other Apples, which gave rise to a discussion on the keeping qualities of the Apple mentioned, and in one case a suggestion was made that Mr. Turton's method of keeping the fruit was at fault. Having seen the Apples when they were stored, and again in November and February, I can endorse all Mr. Turton said regarding this Apple. Seldom have I seen better preserved or finer fruits of *Annie Elizabeth*, *Blenheim Orange*, *Cox's Orange Pippin*, *Cockle's Pippin*, and others, than I saw a fortnight ago in Mr. Turton's fruit-room. At the time of my visit some old Vines of the variety *Mrs. Pince* occupying a house, but so old that they have ceased to be productive, were being removed. The old border was to be taken away and a new one made. When the house is replanted, Mr. Turton intends to plant some of this variety again, and as I tasted some of the fruit ripened last year, I thought the high flavour and perfect condition of the berries justified such a course. *Sherborne Castle* has long been celebrated for fruit. I remember the fine Pines grown there over thirty years ago. Also the late Mr. Pragnell's experiment with *Golden Champion Grape*, and the failure that attended this; starting about twenty strong canes in large pots at the end of the year. *Primulas* have recently made

a glorious display at *Sherborne Castle*; they are found to be exceedingly useful as vase plants in the dwelling-rooms. There was not a poor plant amongst them, and the strain was of the best. *Freesias* are grown in large numbers, and most of them are in 5 and 6-inch pots, which contain from five to ten bulbs each. Amongst other useful plants for house decoration I noticed a nice batch of the old *Gesnera cinnabarina*; they are very ornamental with their long spikes of bright flowers rising out of the deep red leaves. These gardens are not favourably situated for the growth of some crops. I noticed how some dwarf Scotch Kale had suffered from the frost in December last, but here in our own garden, the dwarf and very curled types have suffered most. *J. Crook, Forde Abbey Gardens, Chard.*

SALE OF HORTICULTURAL POISONS.—I have no interest in trade of any kind, but I am a reader of one of the chemist's trade journals, and I feel it impossible not to be indignant at the unnecessary course of action pursued by the Pharmaceutical Society, under an Act of Parliament which never could have had the intention read into it by the Society. The Society cannot possibly free itself from trade interests, and the question arises whether the Society should have any power of legal action. Professional loyalty, so absent among horticulturists, is a good deal overstepped by the pharmacist. It is only necessary to observe what is written on the subjects of company trading, whether the widow might or might not continue the business of her late husband, and upon the prescribing of ready made tabloids by the medical man, to see that the professional chemist is much more concerned about the exclusiveness of his trade, than about the public safety. It could hardly be otherwise, and therefore I impute no unworthy motive. The public interest is not at stake, and cannot be the question in the mind of the chemist, with regard to the sale of these poisons. The claims of the chemist, in regard to dispensing, are in accordance with the public interest, but it is too ridiculous to say that it makes any difference whether a sealed-up packet or cask is sold by a chemist or by a seedman. According to my experience, it is entirely a myth to suppose that the chemist does anything more than effect a sale, precisely as does the seedman. No accident has yet been charged against the seedman, and, as a matter of fact, both chemist and seedman are equally helpless in following the poisons to where any danger can arise. The only way of securing absolute safety is the impossible way of prohibiting the sale of poisons altogether. Something, however, might be done in that direction. According to law, machinery has to be protected in workshops, and there might be some regulation made to secure the proper storage of poisons. Is it not absurd to hamper the seedman, while the poisons sold by the chemist are often free to everybody after they have left his shop? Poisons are necessary in many businesses, and the majority of people must always be able to get what they want. It does not matter where it comes from. *Fiat Justitia.*

CANNA AUSTRIA.—In reference to an enquiry by "S. W." in last week's issue of the *Gardeners' Chronicle*, it may interest this correspondent to be informed that I grow very large batches of *Cannas* very easily. *Canna Austria* and *C. Italia* I start about this date in 48's, in a humid house, having a temperature of 65°; and when the pots are well filled with roots, I repot the plants into 10-inch ones, putting plants from three 48's into each; fibrous loam in a roughish state, leaf-mould and horse-droppings compose the potting-soil, and as much coarse sand as will keep the compost porous. The plants are still kept in a warm-house, and the syringe is freely used on them till they begin to show flower, when the plants are gradually hardened-off. I am thus enabled to obtain fine vigorous foliage and large plants, which look quite imposing in the conservatory, the pots being hidden with Ferns and other *Cannas* grown in smaller pots. *Henry Cooper, Vyse Court, Bishops Stortford.*

SUPPLY OF GRASS SEEDS TO KEW, ETC.—Mr. John K. King, Royal Seedsman, of Coggeshall, Essex, and Reading, has again received a request from H.M. First Commissioner of Works, to supply the whole of the Grass Seeds required this year for sowing in the Royal Parks, and Royal Gardens, Kew.

CULTURAL MEMORANDA.

ASPIDISTRAS.

THESE are among the most useful of town plants, and, indeed, for any house where gas is used. Both *A. lurida* and the variegated form are equally hardy, and with a little attention will flourish in positions where most other kinds of plants collapse in a few days. The present is a suitable time for the propagation of these useful plants. It is usually accomplished by pulling those plants not required into pieces, each with a leaf or two, and potting up into a mixture consisting of fibrous loam, a little leaf-soil, and coarse sand. Although a warm house is not necessary, the plant being almost hardy, a little warmth after division will start growth and root action, and the plants recover quickly. A Peach-house or vinery which was started at the new year will afford a temperature suited to their present requirements; and as they are rarely infested with any insect pests, they may be safely introduced to such structures. In the summer both large and small plants are useful for grouping in the fireplaces of mansions and other out-of-the-way positions, where they last in good condition throughout the season, their only requirement being an occasional cleansing of the foliage, and a moderate supply of water at the roots. *C. H.*

IRELAND.

THE WEATHER.

THE climate of the metropolis and adjoining counties has certainly been very trying to all forms of vegetation, and much injury has been done to out-of-door crops in gardens. The weather has since changed; the following notice concerning this brief spell of winter has been issued to the press by Mr. F. W. Moore, Curator to the Botanic Gardens, Glasnevin:—"It may interest your readers to know that on Saturday night last the minimum thermometer on the grass (a registered and certified instrument) registered 22° of frost, falling to 10° Fahrenheit. This was the coldest night registered here since December 15, 1882, when there were 22·4° of frost; on December 24, 1878, there were 27·4° of frost."

FATALITY.

On February 11, an accident, attended with fatal consequences to Mr. J. English, the gardener, occurred in the gardens of the Oblate Fathers, at Inchievre (Dublin). He was engaged in pruning, fell to the ground, and died shortly after admission to the hospital. *A. O'N.*

PRUNING OF THE VINE.

THERE is hardly a more important operation connected with the culture of the Vine than that of pruning, for upon the manner in which this is performed, the longevity and future vigour of the plant will greatly depend. In the first place it is necessary to select a suitable time for doing the work. If there are at present Vines still unpruned they ought to be attended to without further delay, or bleeding will undoubtedly ensue. We find the best time for pruning late Vines to be in December, so soon as the Grapes are cut and placed in tins or bottles in the fruit-room. By doing so then, we are able to throw open the vinery and disperse with fire-heat for a few months, thus giving the Vines a complete rest. If the Grapes are allowed to hang upon the Vines until later (as sometimes happens, when other important work yet remains to be done), not only do they shrivel and decay more quickly than if they were in the fruit-room, but the Vines also experience no real rest, because a certain amount of warmth is required to maintain the fruit in good condition, necessitating the partial closing of the house.

Forced Vines, of course, will necessarily have to

be pruned earlier in the season; we cut back those in our first house in October, starting them again in November. Bleeding is not so liable to take place with these as with Vines pruned in January, for the sap does not flow so readily at that season, even in Vines regularly forced, as it does in others at a later period. Spur-pruning is now invariably practised with most varieties, and proves the most convenient and satisfactory if carefully performed.

Most cultivators at the present time advise shortening the ripened wood of the previous summer to the best bud, whether this be close to the base of, or an inch or two, along the shoot.

This system, however, in my opinion, is not one to be altogether commended, and I think the necessity of having to leave so much wood to retain a good bud, somewhat tends to show faulty culture the preceding summer. By following such a practice, in a few years' time the spur becomes very long, and besides being most unsightly, it would be also detrimental to the welfare of the tree.

Much valuable space is thereby wasted, the shoots are crowded together—a condition which prevents their proper ripening, and it is also easily noticeable that the spur decreases in size and vigour every year when allowed to lengthen to such a degree. In a late vinery there should be no difficulty in finding a sufficiently plump bud quite close to the base of the shoot to which to prune the latter—usually there are two or three of them. If, supposing the second or third bud from the base were larger and apparently more likely to produce a better shoot than the bud below, I would still cut the shoot down to this latter, for I believe that whatever slight advantage is gained by leaving the larger bud, is equalised, probably, by the subsequent vigour of the lower shoot; at all events, certainly by the future strength and continued fruitfulness of the Vine.

By keeping the spurs as close to the stem as one is able, the resulting shoots are much stronger and healthier than those from long and weakened spurs. I know that in the case of early forced Vines it is a more difficult matter to find a good bud suitably placed near the base of the shoot, but I would rather prune to an indifferent-looking bud well back, than to a plump one a good deal higher.

Much can be accomplished during the previous summer to secure the development of suitable buds low down, by pinching the young shoots judiciously—not allowing them to become too long before doing so—and endeavouring to have them as short-jointed as possible, towards which condition a properly-regulated temperature and suitable atmosphere are most essential. Do not allow them to become crowded, either by the growth of laterals and sub-laterals, or by the presence of too many spurs; a free admittance of light and air is very necessary.

After the fruit is cut, I make a practice of semi-pruning the ripening wood; that is, I shorten this back to about half its length, believing this to assist in developing and plumping-up the back buds. It will often occur that the two lower buds are smaller than the next one above, and I think if the shoot were cut back as I have mentioned, this would not so frequently be the case. I remember a vinery in which the Vines were about fourteen years old, and though they had only been forced for some four or five years, they were completely worn out, and hardly able to produce fruit at all. Their failure I attribute in a large measure to the system of pruning practised; some of the spurs were quite 12 inches long, and if it had not been for some young wood trained up from the base of the trellis, fruit would have been altogether absent.

Where there is room, and it is thought necessary, it is an excellent plan to introduce young rods from the base of the older ones, and to train them alongside these—eventually, to take their place altogether.

In the case of a spur dying off, as happens not infrequently on hard-forced Vines, the shoot from the spur immediately below may be allowed to extend so as to fill the gap.

There are a few varieties of Grapes which pro-

duce soft wood, and this often ripens badly. For such as these, the method of pruning known as "the long-rod system" is generally recommended, that is, as much young wood for bearing is introduced as there can be found space for, instead of relying on short spurs for the production of fruit. This system, however, is easily abused if too much young wood be introduced, and left at too great length at the annual pruning; the formation of soft and immature wood is certain to increase.

Such varieties, too, must not be planted in so rich a soil as that generally used for a Vine-border, as the tendency of the plant to produce soft shoots would thereby be increased.

Another cause of failure to successfully cultivate the Vine, I believe, lies in the fact that when pruning young Vines, too much of the leading shoot is left annually, resulting in the formation of weak and useless spurs. Only so much should be allowed to remain as can be furnished along its full length, with good, sound fruit-spurs. H. H. T.

LAW NOTES.

INTERESTING SEED CASE.

In the City of London Court, on Friday, an action was brought by Messrs. Howcroft & Watkins, 10, Floral Street, Covent Garden, against Mr. R. W. Gardner, Romford, to recover the sum of £6 15s. damages for breach of contract in respect of certain Swede Turnip-seed.

Mr. W. R. Huson, plaintiffs' solicitor, said that the plaintiffs bought the seed of the defendant on the understanding that it was 1898, or new seed. The plaintiffs, upon applying the ordinary test, which was well known in the trade, found that the productiveness of the seed only yielded 66 per cent., and not 98 per cent.

Mr. Chas. Butcher, defendant's solicitor, said that the parties were well known to each other, for the defendant had been in the plaintiffs' service for twenty years. He had sold them the seed in question the day after he had purchased it. They retained it for two months before they found any fault with it. The practice was to test seed within a week. The plaintiffs had dealt with the seed before rejecting it.

Mr. Watkins, plaintiffs' manager, was called, and spoke to having purchased 8 or 10 bushels of the seed in question at 13s. 6d. per bushel. He understood he was buying new seed, and that meant that it was the previous year's seed. They usually tested seed immediately it came into their warehouse. The seed in question was tested in flannel and then in soil.

Mr. Butcher explained that the plaintiffs should have rejected the seed within a reasonable time, and that they did not do. The defendant was called, and said that he bought the seed in question for 11s. 6d. a bushel. Knowing that the plaintiffs wanted some of the same sort he offered it to them, and they bought it, his profit being £1 on the transaction. Two months after the deal the plaintiffs wrote and told him that the seed did not grow well. Mr. Paul Ursulas was called to prove that the seed had yielded 90 per cent.

The Deputy Judge said he came to the conclusion that there was a warranty that the seed was new seed. Judgment was given for the plaintiffs for £2 5s. as damages, with costs of the action, and they would keep the seed.

NURSERY NOTES.

MESSRS. JAS. VEITCH AND SONS.

GREENHOUSE Rhododendrons have been making a good display in the houses devoted to their cultivation at the Royal Exotic Nursery, King's Road, Chelsea, and at the present time there are over thirty fine and distinct forms in pink, rose, yellow, orange, scarlet, and red tints. The plants are furnished with flower-buds in all stages of develop-

ment, which indicate a considerable quantity of bloom yet to expand. Among the double-flowered kinds known as *R. balsaminiflorum*, four are in bloom, viz., aureum, album, roseum, and carneum. Of the others, the best pure white is *R. Mrs. J. Heal*; of the red and orange, *R. Souvenir de J. H. Mangles* was fine; *R. Little Beauty*, a rich red-scarlet of a new section, very free-flowering like others of the *R. multiflorum* crosses. Other very handsome varieties noted were *R. Cloth of Gold*, *R. Primrose*, *R. Hercules*, *R. Princess Christian*, *R. Lord Wolseley*, *R. Apollo*, and *R. Thetis*. These hybrid Rhododendrons seem well adapted for growing in the neighbourhood of towns, where softer wooded plants as a rule do not thrive. In a warm greenhouse, or conservatory adjoining the dwelling house, they thrive as well with town surroundings as they do in the country, once their simple culture is understood. In gardens generally, greenhouse Rhododendrons are much too frequently re-potted, and often placed in flower-pots which are too large. Comparatively small pots, and the retention of the plants in them as long as possible without re-potting, are far more conducive to their successful culture.

ORCHIDS.

We noted much that showed the usefulness of some of the hybrid Orchids raised by Messrs. Jas. Veitch & Sons at the present season, the display nearly all consisting of these plants. The Dendrobiums at present are the more numerous, and among the showiest at the present time in bloom, and which form a display throughout the entire length of the long house in which they are placed, we found several forms of the *D. × splendidissimum grandiflorum* class in great beauty, but of that section the handsome *D. × rubens grandiflorum* (*splendidissimum grandiflorum × nobile nobilium*) was by far the best. Several forms of *D. × Wardiano-japonicum* show how great beauty some of these smaller hybrids may develop when the plants become strong. One fine form having a 2-feet pseudo-bulb was densely furnished with its pretty white, rose-tipped flowers. *D. × Stratius* (*moniliforme × Dalhousieanum*) is singular and pretty; *D. × Wiganie*, a very desirable hybrid, and *D. × Dominianum*, *D. × euosmum leucopterum*, *D. × Schneiderianum*, *D. × endocharis*, *D. × dulce*, and other pretty hybrids are very effective. Of the species arranged with these plants are many examples of the singular and showy *D. atro-violaceum*, *D. Wardianum*, *D. luteolum*, *D. crassinode*, *D. nobile* varieties, including the delicately tinted *D. n. Ballianum*, the singular orange-scarlet *D. subclausum*, and other rare species.

Among the Cypripediums in bloom were the new and pretty *C. × Actæus Langleyense* of the form of *C. × Leeanum*, but the colour of *C. insigne Sanderi*; varieties of *C. × Hera*, *C. × Germinyanum*, *C. × Godseffianum*, *C. × Calypso*, *C. × Dauthieri luteum*, *C. × vexillarium*, *C. × Lathamianum*, *C. × Pharus*, varieties of *C. × Harrisianum*, of which the dark coloured *C. × H. superbum* was the best; *C. × Sallieri*, *C. × nitens*; a good show of varieties of *C. Leeanum*, *C. insigne*, *C. villosum*, *C. Lindleyanum*, &c.

In the Phalenopsis house, it was remarked that all the species thrive at Chelsea; and along with the *P. Schilleriana*, *P. Aphrodite*, and other species, was a number of vigorous plants of the many fine crosses raised by Messrs. Veitch, including *P. × Hebe* (*Sanderiana × rosea*), *P. Vesta* (*Aphrodite × rosea leucaspis*), like a large light-coloured *P. intermedia*; *P. × Ludde-violacea*, *P. × F. L. Ames*, *P. × Harrieta*, *P. × Stuartiano-Manni*, &c. *P. × Jas. H. Veitch* (*Luddemanniana × Sanderianum*), bearing a spike of pretty cream-white flowers spotted with dark rose colour; and *P. × Cassandra* (*rosea × Stuartiana*), with very pretty and distinct blooms. It is noteworthy that the hybrid Phalenopsis, as in the case of most other garden-raised plants, even those resulting from very dissimilar parentage, grow and flower more readily than imported plants.

In the Rockery show-house is a good display, con-

sisting of *Odontoglossum Inseayi*, *leopardinum*, and other species; various *Oncidiums*, including the insect-like *O. phymatophilum*, *O. Forbesii*, &c. On one side is arranged a number of hybrid *Epidendrums*, chiefly crosses with *E. Endresii*, *E. Wallisii*, the plants being well furnished with flowers. Among other plants noted were the elegant *Ionopsis paniculata*, the rich rose-coloured *Phaio-Calanthe* × *Niobe*, and the bronzy-rose *P.-C. × insperata*, large pans of *Celogyne cristata* *Lemoniana*, and the white *C. cristata hololeuca*, *Angraecum eburneum*, &c.

In the large *Cattleya* and *Laelia* house, the immense quantity of all the showy species are in grand health, and well-furnished with flower-sheaths, though at the present time a few only of good *C. Trianaei* are in bloom. Remarkable both for quality and quantity is a number of very fine *Cattleya Schroderea*, a species only now becoming fully appreciated; and *C. aurea*, which has always been a favourite.

In one tolerably cool house the stock of *Vanda cœrulea* was remarkable. Another is filled with flowering-sized *Lælio-Cattleyas*, and *Cattleya* hybrids, the newer and flowering plants being yet at the hybrid Orchid Nursery at Langley.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

FEBRUARY 13.—*Present*: Mr. Bennett-Poe (in the Chair); Mr. Hudson, Rev. W. Wilks, and Rev. G. Henslow (Hon. Sec.).

Elm-bark with larvæ.—Mr. W. Brooks, of Weston-super-Mare, forwarded a piece of bark of an English Elm-tree, with the following observations:—"The Elm-trees are attacked by an insect which is destroying them. Some of the trees are fine, nearly 100 feet high, and in their prime; others are smaller. The larger trees are attacked more especially on the north side; but the smaller all around the stem from bottom to top. One of the largest trees shed all its leaves in August, and it looks as if the whole of the trees will die."

Mr. McLachlan sends the following report:—"The Elms are attacked by the larvæ of a beetle. No perfect beetles are to be found in the bark sent, but there are numerous larvæ, each in a small cell, in which it will undergo its transformations. So far as can be judged from these larvæ, they are those of *Scolytus destructor*, so common in many places. In order to destroy them it was suggested, more than forty years ago, by the late Capt. O. J. Cox (who probably took his idea from the French), that all the old outer bark be pared off by a spokeshave or some similar instrument (the scrapings being of course collected and burnt), taking care not to injure the inner bark and wood. Dressings of dilute petroleum, repeated at intervals in dry weather, might also be of service. But the subject opens up a wider question, viz., whether the beetle is the cause of the condition of the trees, or only steps in where these latter are in a moribund state from some other cause. The writer of these remarks is inclined to think the beetles come as scavengers. At any rate, in the case of tall old trees, probably already 'steg-headed,' it is practically useless to employ remedial measures, and the best thing is to cut them down and burn them—or, at any rate, cart them away at once from the vicinity of trees not already attacked. The bark of such old trees is usually riddled by the larvæ from base to top. When the trees are younger and less tall, remedial measures, such as those suggested, might be tried. Even supposing the trees to be in an unhealthy state from some other cause, the attacks of the beetle must aggravate that state and hasten decay; and if these attacks could be lessened or averted, there might be a chance of the trees recovering from the other conditions whatever they may be. But, as a rule, disease or decay have already proceeded too far before being discovered."

Fern-roots attacked by grubs.—Mr. Burt, The Gardens, Casenwood Towers, Highgate, sent a specimen of soil and grubs with the rhizomes of *Adiantum cuneatum*. Mr. Hudson observed that he was not unfamiliar with them. The specimen was forwarded to Mr. McLachlan, who reports as follows:—"The grubs at the roots of *Adiantum* are those of a species of weevil, probably *Sitona*, but I cannot commit myself to anything more precise without seeing the perfect insects. I should think the best thing to do now would be to turn out the plants from the pots, shake the old soil from the roots, and re-pot in clean earth, taking care to burn all the old with the grubs. When the foliage shows signs of being attacked, go over the pots at night, turn each pot gently on its side, and shake the foliage over a sheet of paper. By this means multitudes of the perfect insects may be collected and destroyed, and the deposition of eggs prevented."

Orobanchæ on Pelargonium.—A plant in flower was received from Frances M. Cooper, Forest Road gardens, Wokingham, described as having "established itself in a pot of *Geranium*." The latter at first showed no sign of diminished vigour; but

now the specimen has come into bloom its host-plant seems to be weakly, and its leaves are turning yellow. The plant does not seem quite like any wild species. The *Orobanchæ* was of a purple colour throughout, but not agreeing closely with any true British species.

THE SCOTTISH HORTICULTURAL ASSOCIATION.

FEBRUARY 5.—A meeting of the members took place at 5, St. Andrew Square, Edinburgh, on the above date. Mr. Mackenzie, the late Treasurer, in the Chair. There was a capital attendance, and as there were no exhibits, the usual routine business of reading the minutes of the last meeting, nomination of new members, and other matters (the latter numbering six), was speedily got through.

This gave Mr. D. T. Fish a long evening for his lecture on 'Plants as Manufacturers.'

Mr. Mackenzie praised the lecture as an outburst of eloquence, and Mr. Fish was, during its delivery, often applauded.

Mr. Murray said that it elevated the life of plants above that of man—which was an error.

Mr. James Grieve spoke of the lecture as a poem, and hoped a big place would be kept for Wallflowers and *Violas*.

The Chairman put the vote of thanks, which was carried unanimously, amidst applause.

Mr. Fish replied in suitable terms.

THE NURSERY AND SEED TRADE ASSOCIATION, LIMITED.

FEBRUARY 9.—The annual general meeting was held at the offices of the Association, 30, Wood Street, Cheapside, London, when the report of the committee of management and balance sheet for last year were adopted.

The report showed that the Association consists of 154 members (which include many of the principal wholesale firms), engaged in the nursery and seed trade in England and on the continent. Twenty-eight members joined the Association last year. One of the main objects of the Association is to give the members the opportunity of giving mutual information through the secretary as to the financial position of traders seeking credit. During last year the Association answered 1386 trade enquiries, being a considerable increase on the previous year, and expended £18 13s. 6d. in obtaining special information in the districts in which some retail traders resided respecting their financial position. For the same period the Association collected for its members debts amounting to £3208.

The annual report contained sections of the Pharmacy Act, under which proceedings have been instituted by the Pharmaceutical Society against nurserymen and seed-merchants for selling by retail compounds for killing weeds on walks and insects on plants. As the members present desired that the Pharmacy Act should be amended to permit of nursery and seed merchants selling these compounds, the subject was referred to the committee of management to consider and determine what steps should be taken in the matter, and to ask the assistance of the manufacturers of, and wholesale dealers in these compounds, in defraying the costs incidental to the preparation and passing of an Act of Parliament.

The President, N. N. Sherwood, Esq. (Hurst & Son); W. J. Nutting, Esq. (Nutting & Sons), Treasurer; H. J. Veitch, Esq. (Messrs. James Veitch & Sons, Ltd.); H. Simpson, Esq.; Messrs. Cooper, Tabor & Co., Ltd.; and John Hayes, Esq. (Messrs. J. J. Hayes), Trustees, were re-elected, together with a Committee of Management.

The President expressed his opinion, and the members concurred, that it was advisable that a fund should be raised to enable the Association to take the opinion of Counsel upon questions affecting the trade, and to contest or support any action for their mutual benefit.

NATIONAL CHRYSANthemUM.

FEBRUARY 12.—The first meeting of the executive committee after the annual general meeting took place on the above date.

A letter was read from Sir Edwin Saunders, thanking the members for re-electing him as President. The Secretary laid upon the table a circular from Messrs. H. Gaze & Son, setting forth particulars of proposed trips to the Paris Exhibition. A report was made as to the recent election to the executive committee, and it was announced that one of the gentlemen elected having refused to serve, Mr. R. C. Pulling, Leytonstone, the next highest on the poll, would take his place. The amendments to the rules made at the annual general meeting were reported. The Secretary called attention to the resolution passed at the last meeting of the executive committee, appointing a Show committee to carry out the arrangement of the various exhibitions, and suggested that the members of that committee should be elected, so that their names could appear in the schedules of prizes; but there being considerable divergence of opinion as to whether or not the present general Secretary should be superseded in that position, the matter was postponed for further consideration. Messrs. E. Beckett, N. Davis, G. Langdon, J. H. Witty, J. Brooks, J. Melfattie, R. C. Pulling, and J. W. Simmons, were elected members of the floral committee; the classification schedule revision and finance committees were appointed, and various other items of business disposed of.

KINGSTON CHRYSANthemUM.

FEBRUARY 12.—The annual meeting of this well-known Society was held in the new Coffee Tavern on the evening of the above date. There was a very large attendance of members. Mr. W. DREWETT presided.

The report showed that during the past three years the Society had to encounter adverse balances, which had been gradually reduced, and now the committee were able to show, after deducting 10 per cent. from all prizes paid over £1 in amount, that after discharging all liabilities, inclusive of over £12 to the late secretary, there would be a balance of just over £3 in hand. Sir J. WHITTAKER ELLIS, High Sheriff, was elected President; Mr. A. W. HOMER-SHAM, Treasurer; and Mr. W. HAYWARD, florist, Fife Road, Secretary. There was a keen contest for the membership of committee, twenty having to be elected. After balloting, most of the old members and several new ones were returned. Of these, twelve are gardeners, and represent a wide area. It was urged that the new committee should take the preparation of the schedule in hand at once, and a meeting for that purpose was fixed for the 19th inst.

ROYAL GARDENERS' ORPHAN FUND. ANNUAL MEETING.

FEBRUARY 16.—The annual meeting of the supporters of this valuable Fund was held on the above date in the Essex Hall, Essex Street, London, W.C. Including the representatives of the press, there were present about thirty persons. The Chairman of the Executive Committee, Mr. W. Marshall, was absent through indisposition, and other prominent supporters of the Fund were unable to be present from the same cause. The chair was taken by A. W. G. Weeks, Esq.

EXTRACTS FROM THE REPORT OF THE EXECUTIVE COMMITTEE.

In presenting their twelfth annual Report, the committee have pleasure in congratulating the subscribers on a year of steady progress, the receipts from all sources showing an increase of £75 1s. 2d., which is satisfactory as indicating that, notwithstanding the great difficulty experienced in collecting subscriptions, owing to the many urgent appeals made to the benevolent for support in aid of the various patriotic funds, the Royal Gardeners' Orphan Fund has not only been able to hold its own, but also to increase the amount of the year's aggregate allowances made to the orphans. The revenue derived from subscriptions and donations, though showing an increase on the previous year, reveal a sensible decrease in the amount collected by local secretaries, a circumstance which the committee can only regard with some anxiety, though they have reason to believe that the falling off in this source of income is only temporary.

The number of children who have been elected to the benefits of the fund during the past eleven years is 113, and the total amount which the committee has been enabled to distribute among the destitute orphans during that period is £7,711 3s. 6d. The number of children now on the fund is seventy-two, exclusive of those to be elected this day.

The committee desire to acknowledge the services rendered to the Fund by Alderman Sir Reginald Hanson, Bart., M.P., who so kindly presided at the Annual Festival, and whose expressed appreciation of the work carried on by your committee, and his most forcible appeal for support on its behalf resulted in a subscription list amounting to £262 12s., a result which was the more gratifying in that the Festival had, for unavoidable reasons, to be held at a later period of the year than usual. The committee have much pleasure in recommending that Sir Reginald Hanson be this day elected a vice-president of the Fund.

Lord Battersea has kindly consented to preside at the next festival, which has been fixed to take place on Tuesday, May 8, at the Café Monico, 46, Regent Street, W.

The committee sincerely deplore the loss which the Fund has sustained by the death of Mr. Sydney Courtauld, one of the trustees, whose kindly support in its earlier days remains with the committee a cherished memory. Mr. William Sherwood, the eldest son of the treasurer, has expressed his willingness to undertake the duties and responsibilities of the office of trustee, and the committee ask subscribers to confirm their choice.

By the recent death of Mr. Alfred Outram, the Fund has lost the services of another devoted worker, and the committee a colleague whose genial presence and whole-hearted sympathy with the objects of the fund will be greatly missed. The seat vacated by Mr. Outram's death has been filled by the election of Mr. Peter E. Kay, Chislmarn, Church End, Finchley. The resignation of Mr. J. Cheal has also been received, and the vacancy filled by the election of Mr. W. R. Alderson, Bell Farm, Hersharn Road, Walton-on-Thames.

The members of the committee who retire by rotation are Messrs. W. Bates, R. Dean, H. Herbert, H. J. Jones, W. Marshall, H. B. May, G. Reynolds, and A. W. G. Weeks; and Messrs. Bates, Dean, Jones, May, Reynolds, and Weeks, being eligible, offer themselves for re-election. Mr. Whitpainé Nutting, 106, Southwark Street, S.E., and Mr. E. G. Monro, Covent Garden, W.C., are nominated by the committee for the vacant seats.

The retirement of Mr. Marshall and Mr. Herbert are incidents in the history of the Fund which your committee cannot but deeply regret, and their colleagues desire to place on record their high sense and appreciation of the valuable moral and material support which these gentlemen have so ungrudgingly rendered to the Fund. Mr. Herbert, one of the founders of the Fund, was one of the most constant attendants at the meetings of the committee until struck down

with illness, from which he has unhappily not yet recovered; and the committee ask the subscribers to signify their appreciation of his good and faithful service by according him their special thanks. Mr. Marshall's services to the Fund as Chairman since the lamented death of Mr. George Deal in 1890, have been invaluable, and as a slight recognition of the uniformly courteous and efficient manner in which he has so long and so faithfully discharged the duties of his office, the committee have the pleasure this day of nominating him for election as a Vice-President.

It is not necessary to print the full statement of accounts here, but we may say that the total income for the past year was £2,203 9s. 3d. The total investments amount to nearly £10,000. On the expenditure side, the allowances to orphans during the year amounted to £946 15s., and grants in aid accounted for another £18 17s. 6d. The balance in hand, at bank and on deposit, is £286 4s. 5d.

PROCEEDINGS.

After the adoption of the Report had been moved by the Chairman, a letter was read by the Secretary from the Bournemouth District Gardeners Mutual Improvement Society, expressing an opinion against permitting more than one child in a family to be given the benefits of the Fund at one time, "unless under special circumstances."

Mr. R. DEAN proposed to refer the letter to the Executive Committee. That committee only recommended such children for election in cases where there were "special circumstances." After some remarks by Mr. A. DEAN, a very satisfactory explanation of the question was made by Mr. W. ROUSELL. The Fund, said he, is at present able to extend benefit to more than one member of a family, where necessity demanded such a course, and possibly the committee would have to consider whether or not they should not continue assistance to some children after they have attained the age of fourteen years. The committee did not propose to follow the example of the Patriotic Commissioners, and save a great amount of money for future use, at the same time administer to present needs in a niggardly fashion. He believed it good policy to make the best use of the money possible; to help the orphans liberally, and to the extent they are able, the public would then respond to such a policy by providing the amount of means necessary.

The Report and cash statement was accepted with acclamation. Alderman Sir REGINALD HANSON and Mr. W. MARSHALL, were then elected Vice-Presidents. Mr. W. SHERWOOD was elected a Trustee. The Treasurer, Mr. N. N. SHERWOOD, and the Auditors were thanked for their services, and Mr. MARTIN HOWAN was re-elected to act in the latter capacity with Mr. P. RUDOLPH BARR.

Following a vote of thanks to the committee, Messrs. E. G. MONRO (son of Mr. Geo. Monro), and Whitpaine Nutting were elected members of that body, and retiring members were re-elected as recommended in the above report.

A resolution was passed regretting the circumstances that have led to the retirement of Mr. H. HERRST from the committee, and expressing appreciation of the good work he has done.

A vote of thanks to the Secretary, Mr. WYNNE, was passed unanimously on the proposition of the Chairman, seconded by Mr. ASBEE, and supported by Mr. W. BATES, and Mr. MILES, a deputation from the Southampton Auxiliary.

ELECTION OF ORPHANS.

The Committee of Scrutineers reported that the following nine children were duly elected to the benefits of the Fund.

HILDA KATHLEEN MARY ROGERS	504 Votes.
AARON HALL	470 "
WINIFRED MOXHAM	429 "
CHAS. ARTHUR DRANFIELD	427 "
JOHN BAIRD	254 "
EDWARD WHITE	237 "
GEO. WILLIAM STEVENS	153 "
MARGARET MAY WOOD	148 "
SARAH LOUISA EMILY LANGLEY	135 "

When the business of the meeting had proceeded thus far, the Chairman made the satisfactory announcement that the committee recommended that the two unsuccessful candidates—Arthur Gregory Stevenson and Ernest Stanley Henderson, together with three other candidates—whose claims had been placed before the committee since the list voted upon had been drawn up, be also placed upon the benefits of the fund with out election.

The Chairman, and Messrs. R. DEAN and W. POUPART, all declared their belief that the financial position of the fund warranted this course of action, and the proposal was agreed to with much satisfaction. The committee have therefore provided for all claimants up to the present time. The names of the three late candidates are Mary Alice Wood, Frederick George King, and Joseph George Riddell.

In the evening was held at Carr's Restaurant, Strand, the annual friendly dinner of the committee and friends; Mr. GEO. MONRO presided, supported on the right by Mr. N. N. SHERWOOD (Treasurer), and on the left by Mr. ASBEE. There was a general feeling of satisfaction at the condition of the Fund, and a determination not to abate in the least the endeavours that have been made in the past.

CHESTER PAXTON.

At a meeting held in the Lecture Theatre of the Grosvenor Museum on Saturday, Mr. Robert Newstead, F.E.S., delivered a lecture to the members on "Recent Important Investigations of the Currant-bud Mite," followed by "Notes on the Pear-tree Slug." Dealing with the Currant-bud Mite, Mr. Newstead gave some very interesting particulars of a series of experiments he had recently conducted on the Duke of Bedford's fruit farm at Woburn, with a view to the extermination of this pest so much dreaded by growers of bush fruit.

After having unsuccessfully tried many so called practical remedies, Mr. Newstead said he had come to the conclusion that the best and most expeditious method of getting rid of the mite was to cut off all the infected branches and burn them. He then gave in detail the result of his inquiries into the life-history of the Pear-slug and the best means of dressing the trees infested by this destructive insect.

An animated discussion followed, in which Mr. Robert Wakefield, President of the Society, and others took part; and Mr. N. F. BARNES in proposing a vote of thanks to the lecturer mentioned the fact that the Royal Horticultural Society had recently recognised Mr. Newstead's ability as practical entomologist by inviting him to lecture at one of their London meetings.

SHROPSHIRE HORTICULTURAL.

THE annual meeting of the members of the Shropshire Horticultural Society was held yesterday afternoon. The Mayor, Mr. R. S. HUGHES, congratulated the members on the extraordinary success which attended the society's last show, and on the fact that the receipts for the past year exceeded any previous record by considerably over £200.

Mr. H. W. NAUNTON (one of the Hon. Secs.), presented the annual report of the committee, from which the following are extracts: "It appears to be the general opinion that the horticultural display in the Quarry, on the 24th August last, was the finest and best ever seen there, and it is satisfactory to report that the attendance was the largest on record, and that the receipts on that day and the profits on the year exceeded all previous returns. The collections of Grapes which included exhibits from many of the best known Vine-growers in the kingdom, were undoubtedly a success, and the results should encourage the society to continue their experiment of introducing novelties in future exhibitions. It is proposed this year to offer large prizes for collections of British grown fruit, which will probably attract a large number of competitors, and which, in consequence of the great variety in form and colour of the exhibits, will no doubt meet with general appreciation."

The Assistant Treasurer presented the statement of accounts, and pointed out that the total receipts for 1899 amounted to £4,739 10s. 11d. The profit on the summer show amounted to £1,050 13s. 5d. The balance in the bankers' hands on December 31, 1898, amounted to £1,898 15s. 3d., and on December 31, 1899, to £2,149 9s. 10d. The actual receipts on two days of the summer show (excluding subscriptions), amounted to £4,154 8s. 2d., and the actual payments on account of the summer show alone to £3,648 13s. 7d. The money taken at the gates on the first day was £379 14s. 9d., and on the second day £1,852 19s. 6d. The society's total receipts for twenty-five years amounted to £65,197 10s. 8d. The donations and gifts made by the society amounted to £3,840 10s. 6d., and in addition to the balance of £2,149 9s. 10d. in the bank, the society owns land situate between the Quarry and the Friar's Bridge, which was purchased for the town at a cost of £5,501. The amount of prize-money awarded during the year was £1,050 17s. 3d.

BRISTOL AND BATH AUXILIARY OF THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

PRESIDENT, J. H. LOCKLEY, Esq.; Mr. G. HARRIS, Hon. Sec. and Treasurer of this branch of the Gardeners' Royal Benevolent Institution. The Seventh Annual General Meeting was held at Chivers' Restaurant, 6, Royal Promenade, Queen's Road, Clifton, on Wednesday, February 21, for the following purposes, viz.: to receive and consider the annual statement of accounts and the report of the committee; to elect a committee of management, and secretary and treasurer for the ensuing year.

The annual report then presented makes mention of the following:—

By the opening of the gardens at Ashton Court and Sneyd Park for the benefit of the Society, the funds were enriched by a sum of £13 11s. 3d.; and Sir Greville Smythe, Bart., and F. Tagart, Esq., were duly thanked for their kindness.

The successful candidates at the election were Messrs. H. O. SMITH, Jay, Turner (Bath Auxiliary), Messrs. LANDSOWNE, Townsend, Wilkinson, Shaddick, and Drewett (Bristol).

It is very gratifying to our Auxiliary to record the election of Messrs. EVANS and W. THOMAS, two of their members, to be pensioners of the parent society.

It is hoped their success will encourage the gardeners in the neighbourhood who have not yet joined the Society to become members.

The Bath Branch of the Auxiliary held a Smoking Concert in connection with the Chrysanthemum Show in their city on November 8, for the purpose of making known the work of the institution amongst local gardeners. Mr. Ingram attended, and gave an instructive address, the result being that several new members were enrolled.

MISCELLANEOUS SOCIETIES.

Cardiff Gardeners.—On Tuesday, February 6, Mr. T. MALPAS gave a lecture on "The Begonia, and its Usefulness for Decorative and Bedding Purposes." The reading of the paper was followed by a long debate, and measures were discussed for the prevention of "rust" and yellow thrip.

Wargrave and District Gardeners.—On Wednesday evening, February 7, the members of this Association met to hear a lecture by Mr. L. TREACHER, F.G.S., of Twyford, on Bowsey Hill, a huge mass of clay, and the highest point in the district. The lecture was illustrated with lantern-slides of geological maps, sections, and photos of various places in the neighbourhood, which were carefully explained. The fossils found in the Reading and Woolwich beds were illustrated, as were also the imaginary restorations of different animals, whose remains had been discovered in these strata. In summing up the chief points of his lecture, Mr. Treacher observed that Bowsey Hill is now only a fragment of what it was in bygone times. The clay of the district was well suited to brick-making, as was evidenced by the numerous brick-fields in the vicinity. A great break in the history of the earth was shown by the strata of the neighbourhood. The exhibits included plants of Cyclamen, Narcissus, Primula, and dishes of Apples, by Messrs. POPE, Greenaway, Fullbrook, and Robbins, respectively.

Bristol and District Gardeners.—The forthrightly meeting of this society was held at St. John's Parish Room, Redland, on February 8, Mr. W. E. GROVES presiding, over a good attendance. Mr. ROGERS, of Staple Hill, supplied a paper on "The Cultivation of Tuberous-rooted Begonias." Mr. ROGERS strongly urged the use of Begonias for bedding, and gave much valuable information regarding their cultivation for this purpose. A discussion followed; and Mr. ROGERS was accorded a hearty vote of thanks for his address.

THE WEATHER IN WEST HERTS.

THE recent cold period, which was one of exceptional severity, may be said to have lasted from January 27 until the 16th inst.—or for three weeks. During that period there did not occur a single unseasonably warm day, and only two moderately warm nights; and on five nights a thermometer, exposed on the surface of the snow, registered from 23° to 28° of frost. The reading last mentioned is the lowest recorded here at any time since February 17, 1895, or for five years.

The frost penetrated uncropped ground, similar to that in the kitchen-garden, to the depth of a foot; but under grass the soil was not frozen deeper than about 9 inches. For nearly a fortnight the temperature of the soil at 1 foot deep varied only about 2°, but no sooner was the frost completely out of the ground than there occurred a rise of 5° in a couple of days—a considerable variation in so short a time for a winter month.

The ground was completely covered with snow for exactly a fortnight, and at one time lay to the average depth of a foot. Had none of the snow melted, I calculate that the aggregate depth on the ground of the different falls would have amounted to twenty inches. Already four inches of rain (including melted snow), has fallen this month, or more than double the average quantity for the whole of February.

The protection afforded low-growing vegetation by snow is shown by the fact that a minimum thermometer placed beneath the snow covering read on the seven coldest nights from sixteen to twenty-two degrees higher than a similar thermometer resting on its upper surface. During the fortnight that these thermometers were so placed, the one under the snow at no time indicated more than eight degrees of frost.

A double Snowdrop growing in my garden came first into blossom on the 18th inst., or ten days later than its average date for the previous thirteen years, and later than in any year since 1895. E. M., Berkhamsted, February 20.

VARIORUM.

A GREAT SUGAR PRODUCING COUNTRY.—The average yield of sugar to the acre of cane is greater in the Hawaiian Islands than in any other cane-growing country in the world, and its position in this respect demands our attention. The average yield of Maui, for instance, is about 3½ tons of sugar to the acre; Hawaii's average is lowered by the smaller producing qualities of her leeward or dry side, but would not go lower than 4 tons; Kauai, from 4 to 5 tons; and Oahu, 6 to 7 tons. There are, of course, pieces of ground, even entire plantations, on each of these islands, where the yield would greatly exceed the average of

the island; one plantation of Oahu, for instance, yields 10 tons of sugar to the acre (it takes 7 to 8 tons of cane to produce a ton of sugar), and special yields of even 16 tons per acre have been obtained from given sections of the same Oahu plantation. The quality of these figures is the better appreciated by comparison with the yield of Louisiana. The average yield of Louisiana—according to the figures of Professor W. C. Stubbs, Director of the State Experiment Station, varies from 1 ton to 2½ tons of sugar per acre, the average being perhaps not over 1½ ton. *American Gardening*.

TREES STRUCK BY LIGHTNING.—Under this title, Mr. Howard B. Little, in *Knowledge* for January, discusses some remarkable cases of trees shattered by the dread stroke, for particulars of which the original article should be consulted, but we may quote here a single passage: "P. de Jersey Grut gave particulars of a case which is perhaps more interesting than any yet cited. In this instance the tree struck was encircled by a rope some 25 feet from the ground, and it so chanced that an end of the rope stood out from the bark of the tree, so that during the earlier part of a rain-storm the tree was damp from the top to the rope, while the lower portion of the trunk was kept comparatively dry. The tree in this condition was struck, the lower part only being damaged. And the damage followed, downwards, a path which the twist in the fibre of the wood made easiest."

Obituary.

PETER WALKER FAIRGRIEVE.—This well known Scottish gardener died suddenly at Dunkeld House on Thursday, 15th inst. He had for a quarter of a century acted in the capacity of head-gardener to the late Dowager Duchess of Athol, and for some years to the present Duke. The intelligence of his death will be received by his many friends and acquaintances with deep regret. He was an enthusiast in all matters associated with horticulture, and was more especially interested in hardy fruits, lecturing on their cultivation, and exhibiting them at Scotch shows. Mr. Fairgrieve had considerable scope at Dunkeld Gardens, and good opportunities for testing the value of varieties of hardy fruits for the northern parts of the country; and he took full advantage of the means at his command. The great gathering of horticulturists from all parts of the country at Dunkeld Gardens some years ago, at the invitation of Mr. Fairgrieve, to inspect and discuss the merits of the fruits grown in that well-appointed garden, will long be remembered as being a meeting of great usefulness. The meeting ended with a banquet at Dunkeld, to which all the visitors were invited, and discussions on fruit and fruit-culture generally in Scotland was entered into with great zest. The Duchess supported her gardener in his efforts to render the conference a complete success. The deceased was a native of Galloway; had a good training as apprentice-journeyman, and went to Wemyss Castle, Fifeshire, as foreman; from thence to Dunkeld in the same capacity; from where he went as head-gardener to Duncrub, near Perth; and a few years later returned as head-gardener to Dunkeld. He was in his 58th year. *M. Temple, Carron*.

TRADE NOTE.

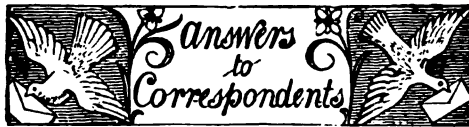

MR. F. C. EDWARDS, who, for the past fourteen years has represented the firm of Messrs. William Clibran & Sons, Oldfield Nurseries, Altrincham, has commenced business as a seedsman, florist, &c., in Leeds.

PLANT PORTRAITS.

BERBERIS THUNBERGI (D.C.). *Mitteilungen der Deutschen Dendrologischen Gesellschaft*, 1899.

EUTAXIA MYRTIFOLIA (R.Br.). *Revue de l'Horticulture*, Belge, January.

PEAR MADAME GILLEKENS.—A seedling raised by M. Neils, and distributed by M. Gillekens. Season, November to the end of December. *Bulletin d'Arboriculture*, &c., January.

AZALEA INDICA: *W. W.* The proper time for re-potting in the spring is just when new root-growth is beginning, which is easily ascertained by turning out a few of the plants. Root-growth is always slightly in advance of top-growth. Summer re-potting should take place after the flower-buds are set, the after treatment of the plants being such that no growth of shoots is brought about. Late in August is a suitable time for plants which have not been forced, as then a gradual fall of the outside temperature is taking place, but the warmth is still sufficiently high to encourage the formation of roots in the new soil. No large shifts should be afforded at that season. Forced Azaleas may be spring-potted, and the growths once or twice pinched before allowing them to set flower-buds; and plants thus treated must be kept under glass, and well syringed daily till the last growth made is getting in a half-matured state, when they may be placed in a fairly sunny spot out of doors. When the flower-buds are set, all plants needed for late spring blooming may be placed in positions out of the reach of the sun.

CALCEOLARIA DISFIGURED: *Ed. C., Ealing.* The plant sent has the appearance of having been very heavily fumigated with Tobacco, or some form of it, or dipped in a very strong insecticide. The tender heart leaves are dead, and the edges of the other leaves badly injured. There was no fungus other than such as is commonly found on decaying vegetation.

CARNATION: *W. M.* We cannot undertake to name florists' flowers. Take them to some large grower of these flowers.

CORRECTION: p. 108, "Influence of the Stock upon the Graft, &c.": for *Demster* read *Kemster*.

CINERARIA: *J. F.* It is an instance of fasciation, or union of several stems into a ribbon-like mass, and may be the result of over-feeding the plants with stimulating manures.

FUNGUS: *H. D. W.* The young state of the dry-rot fungus.

HARDY SPECIES OF ORCHIDS: *R. P. S.* We will comply with your request in an early issue.

MEDICINAL PROPERTIES OF THE APPLE: *J. H. D.* None of the fruits you mention have any special medicinal properties; but all are wholesome. The Banana is the most nutritious, as it contains starchy material. For the answer to your second question, we advise you to apply to the Secretary of the Pharmaceutical Society, Bloomsbury Square.

MOTOK MOWERS: *Balmforth.* The inventor is Mr. W. J. Stevenson Peach, Askew Hill, Burton-on-Trent. See figs. 57 and 58, in *Gardeners' Chronicle*, March 28, 1896.

NAMES OF FRUITS: *Bath.* You have exceeded the number allowed by our rules. 2, Rosemary Russet; 3, Red Ingestre; 4, Striped Beefing; 5, Nelson Codlin; 6, We believe this to be a valuable Apple, nearly lost sight of, i.e., Ord's Apple; 7, Golden Harvey.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*C. E.* Senecio Ghiesbreghtii.—*W. W. T.* 1, Cypripedium × Lathamianum, of the best type; 2, Cymbidium Tracyanum, of unusually dark colour.—*Lælia a. var. alba.* Any of the white forms of *Lælia anceps* have the name *alba* sometimes applied to them, though the true *L. a. alba* is very distinct, and has not the purple lines inside the side lobes of the lip seen in other forms. Yours is *Lælia anceps Stella*.—*J. L., Belfast.* Your flower seems to be Cypripedium × Murillo (Argus × Boxalli). There are many varieties of it, in consequence of the variation in the species employed in getting the different batches of it raised.—*E. M. C.* 1, Oncidium Odontoglossum, sometimes called *O. olivaceum*; 2, Odontoglossum crispum, an ordinary form. Probably the yellowish tint will not be constant.—*A. P. S.* 1, Cheilanthes elegans, so far as we can judge by the scrap sent; 2, Zebрина viridis; 3, Zebрина pendula. Both these are generally called Tradescantia in gardens.—*G. F.*,

1, an Evergreen Oak, perhaps the Fulham; 2, 4, 6, forms of the Douglas Fir, Pseudo-tsuga Douglasii; 3, Picea ajanensis; 5, not recognised. Many thanks for the photographs, they will be useful.

ORCHID LEAVES DISFIGURED: *H. C.* The Orchid leaves are affected by what is known as "disease." The mischief is probably set up by some serious defect in the heating or ventilation of the house in which they were kept.

SPARROWS: *W. P.* Our Parliamentary representatives have seen fit in their wisdom to make a "close time" for these unmitigated pests. Place black thread, tightly pulled, in interlacing lines over your Crocuses, Sweet Peas, &c., or these birds will ruin them.

STEPHANOTIS: *A. H.* It is not an unprecedented occurrence to see a ripe pod. The reason why we do not see it often is probably due to the absence of the right insect to ensure pollination.

THE TREE-PÆONY: *Tientsin.* The best answer we can supply is to copy what is said in the *History of European Botanical Discoveries in China*, by E. Breitschneider, M.D., p. 425:—"The province of Shen-Si, and especially the northern part of it, seems to be the native country of the Moutan tree Pæony. The Shen Si t'ung chi, or Chinese description of that province, published about 200 years ago, reports that in the district of Han ch'eng, situated on the western bank of the Yellow River, between 35° and 36° N. lat., there is, 60 li N.W. of the district city, a hill called Moutan shan, where the Moutan tree grows in great profusion, in a wild state. In spring, when these trees are in blossom, the whole hill appears tinged with red, and the air round about for a distance of ten li is filled with fragrance. The people in this district, as well as in the prefecture of Yen Chou (which lies farther north), use the tree for fuel. No European botanist has ever visited these regions. Mr. Hemslay states that in the Kew Herbarium there are only cultivated specimens of Pæonia Moutan. It has been observed in a wild state in the mountains of Japan." (*Miquel Prol. Jap.*, 197).

VALLOTA PURPUREA: *Hortus.* In the *Gardeners' Chronicle*, January 20, p. 33, in an article on "The Flora of Cape Colony," we mention this habit of Vallota purpurea collapsing occasionally under cultivation. The chief reason is over-potting, and re-potting too frequently. Clean your bulbs, and pot them into the smallest pots you can get them in.

WITHERING OF THE LIP OF DENDROBIUM: *J. R.* The withering of the labellum on some of the flowers of Dendrobium may result from a check by sudden fall in the temperature of the house or some other cause setting up interference with the supply of nourishment. Sometimes when the flowers have been handled, and the labellum broken at the base, the same result occurs.

THE REV. JOHN LAURENCE, A.M.

THIS gentleman occupies a somewhat unique position in the annals of gardening as an authority on fruit-culture, having been the successor of De la Quintinie and of John Evelyn, and fairly superseding both by the comparative soundness of his instructions. He himself was followed at very short intervals by a number of writers, chief among whom was Stephen Schwitzer, whose book on fruit-culture attained great popularity, and which to some extent obscured the merits of the works issued by Mr. Laurence.

Admitted a Fellow of Clare Hall, Cambridge, in 1688, he, as we gather from his earliest work, was appointed rector of Yelvertoft, Northampton, eleven years later, though 1703 has also been named as the year of his appointment. Immediately after entering on his charge he commenced his labours and experiments in connection with fruit-culture, and from here emanated in 1713 *The Clergyman's Recreation*, the first of three little manuals, and the one by which he is best known as a writer on horticulture. This book was written with the praiseworthy intention of creating an interest in gardening among his "brethren," and

at the same time to give them the benefit of his experience, which, gained in a small garden, was nevertheless characterised by much originality. It proved a great success, five editions having been called for in four years; and I have also found it bound up as part of a work treating on a variety of subjects connected with rural economy. Induced by its success, Mr. Laurence, in 1716, proceeded in another treatise to expand his views on fruit-culture, and this he entitled *The Gentleman's Recreation*, of which at least two editions appeared. In 1718, in order to render the series complete, *The Fruit Garden Calendar* was published, and to this is appended an "Essay on the Barometer."

The then well known Bernard Lintott, who, it will be remembered, secured a fleeting immortality in one of Dean Swift's witty effusions, was his publisher.

It will be convenient to note here what appears to us now a very remarkable incident in connection with *The Clergyman's Recreation*. The author, shortly after its appearance, suffered attack from two sections of his readers—a strange return, though not unexpected, as he endeavoured in the preface of that work to meet the very charges that were brought against him. Professional gardeners condemned his teaching, not on account of its unsoundness, but largely because, being a clergyman, it was sagely concluded the writer was thereby incapacitated from giving advice outside the domain of his own profession. No doubt also they winced under the infliction of a slight lashing he bestowed on gardeners as a body for their incompetence, which, however well deserved, was naturally resented. Add to this, that his precepts represented the result of his experience, and that his book was the first that had appeared for at least a century that was not composed of translations from French authors, or mere compilations, and good reason, though no palliation, for the behaviour of gardeners will be apparent.

But it was as a minister of religion that charges of the most grievous nature were made against him. He was said to have prostituted through his book the office he held, and also of having wasted time in his garden that ought to have been devoted to the work of his parish. These and other charges he had foreseen, and had shown in the preface above alluded to, to be groundless; but people were not hindered thereby from formulating attacks on this gardening parson, whose simple habits of life were beyond their comprehension. I have seen one of the pamphlets launched against Mr. Laurence at this time, and it affords a glimpse of the curious sectional feeling stirred up by a matter apparently so simple.

The object of these attacks had, however, made up his mind that gardening when pursued by a clergyman, was in no respect worthy of deprecation, let alone condemnation, and he continued in the even tenor of his way undisturbed by these attacks. Nor did he remain content with merely giving instruction to the audiences reached by his book. For, finding the practice of agriculture in a very backward condition in his own parish, and the farmers so self-satisfied as to pay no attention to his well-meant advice, he resorted to the incontrovertible method of demonstrating on his own ground the better way. The then altogether unsatisfactory practice of sowing Beans on the surface of the ground, and then partly covering them with soil by means of rude harrows, was thus superseded by drill culture. For the institution of this and other improvements he did not claim a pure philanthropy, because, as he naively remarked, when the farmers increased their crops his own income was benefited in a corresponding ratio.

The garden, or, in his own words, what "they used to call a garden," at Yelverton, was a piece of ground about 32 yards square, "mounded round with low mud-walls, quite overrun with Couch, Nettles, and Gooseberry-bushes;" the soil, only 6 inches in depth, resting on a wet, white clay. There is some reason to accept this apology of a garden with its mud-walls as fairly representative of many others in the seventeenth century, though there was also a great number of extensive and well-kept places belonging to the nobility and wealthy gentry.

Mr. Laurence's proceedings on acquiring possession of this spot of wet clay were sufficiently characteristic. Against the advice of his neighbours, though not without their assistance, he at once set about clearing away part of the mud obstruction, and in its place built a 9-foot brick-wall, which in October of the same year he planted with a variety of fruit-trees. His reason for commencing with his garden first, and letting the Rectory and other buildings stand over (and it exhibits very strongly his keen gardening instincts), was that fruit-trees could not be planted too soon, inasmuch as they began at once to make progress to yield a return in fruit; whereas matters about a house could be left till a convenient season arrived without anything worse occurring than a temporary inconvenience! In the space of three years the garden was transformed from a wilderness to a fruitful paradise, flowers at this period holding no place in his affections. He, indeed, inveighed against the cultivation of flowers which please only the sense of sight, as appropriating labour and attention that were in his opinion better bestowed on fruit-trees, which, when in bloom, are equally beautiful with flowers, while they also gratify the sense of taste, and are further valuable as a food.

It must have been shortly after getting his garden into proper trim, and fruit began to reward his labours, that he adopted a method of scaring thieves, which shows him to have been at once ingenious and of a very kindly nature. He ordered the village blacksmith to construct a trap "with formidable teeth, which was to be called a Man-Trap." This was left in the smith's shop during several weeks, and that worthy received a hint to dilate on the horrible fate of the unfortunate whose limb should get within its awful grasp. His powers of description, it is gratifying to know, in conjunction with the horror-striking machine, proved sufficient to put a stop to garden-breaking, the trap meanwhile being stored safely away out of sight.

By and by Mr. Laurence was induced to become a florist, because, in his own words, "There was always a considerable Part of the best Season in the Summer left when there was almost nothing to be done by Way of Diversion," and as his health suffered, or he imagined it did, unless he spent part of every day working in his garden, the cultivation of flowers was for the above reason added to that of fruit. Nor does he allow his readers to assume that he merely potted about. He believed that *Labor ipse Voluptas*, and not only grafted and pruned trees, and sowed seeds, but as occasion demanded he was not ashamed to dig, though he takes care to explain "ad Rubrorum, tho' not ad Sudorem."

He also appears to have been in the habit of visiting nurseries and famous gardens, though it is unfortunate he has left so little on record concerning these visits. The following note of what he saw in the garden of Mr. Balle, at Kensington, in 1717, is proof of how valuable such records might have been. Mr. Balle's residence, it may be explained, was Camdden House, and Bradley appears to have directed the experiments with tender plants carried on in the garden at this period. There Mr. Laurence found a small vineyard with the shoots supported "with Prope," and "very fair bunches of the blue Frontiniae tolerably ripe."

It was in this year, 1717, that he published a small work of a religious nature, and four years

later he left Telvertoft on his promotion by Bishop Talbot to Bishopswearmouth, county Durham, where the living, as I have been given to understand, was worth £3,000 yearly, but this I have not been able to verify. Here, the rectory garden, on a hill, was exposed on all quarters, and Mr. Laurence despaired of succeeding with fruits, though he was agreeably surprised to find all kinds of fruits with the one exception of Grapes, grown to much perfection in gardens in his new neighbourhood. He thought the last-named failed because the best method of pruning was unknown; and in order to teach gardeners the practice, he employed some of his spare time giving demonstrations of pruning. The art of gardening was generally, however, in a very backward condition, and it made him "melancholy" to find south walls covered with Apple-trees instead of Peaches. The best gardens in the neighbourhood at this period were Lumley Castle (Earl of Scarborough), Chester, Beamish, Hilton Castle, and Brancepath Castle, where, in the garden, he discovered an Apricot-tree 30 feet in height, with branches extending 44 feet; and on the castle wall three Pears measuring respectively 41 feet high, by 43 feet broad; 33 feet by 30; and 33 feet by 55. None of these could have possibly been young trees, and they afford interesting proof that fruit culture must have been fairly well understood in the north of England at a date long antecedent to that Mr. Laurence would lead us to suppose.

He was but a short time settled at Bishopswearmouth when his combined works were produced bound in one volume, with a portrait of the author affixed as a frontispiece. Meanwhile his pen had not been lying idle, and in 1726 he gave to the public what he no doubt considered his magnum opus, *A New System of Agriculture*, "Being a Complete Body of Husbandry and Gardening." This is a folio extending to nearly 500 pages, and I have seen it in two sizes, the one a little taller than the other, and in diverse bindings, the taller in calf, the other in boards. It is a work that appears to be not much known, its price in all probability militating against its diffusion when published. It is divided into five books, of which the third, fourth, and fifth are more particularly devoted to gardening subjects. A vast amount of curious information concerning prices, values, and customs, is contained within its boards, though it is naturally devoid of the original characteristics displayed in the earlier group of books. It was the intention of Mr. Laurence to compose yet another work, on road-making, but it does not appear that this was ever effected.

He died in 1732, leaving one son, Rector of St. Mary's, Aldermanbury, and three daughters, all of whom were well married to gentlemen resident in County Durham.

In another communication I hope to glance over the teaching contained in the above-named works. *R. P. Brotherston.*

NEW OR NOTEWORTHY PLANTS.

PRIMULA KEWENSIS (P. FLORIBUNDA × P. VERTICILLATA).

ALTHOUGH the genus *Primula* has so far almost entirely resisted attempts at artificial hybridisation, there are recognised hybrids of accidental origin, and of such is the plant about to be described. Its history is as follows:—*P. floribunda* and *P. verticillata* are both grown in quantity at Kew for use in the conservatory (No. 4), and when in flower they are usually placed together. The plants are raised annually from seeds. Two years ago Mr. Garrett, the foreman, noticed among a batch of seedlings of *P. floribunda*, one with distinct foliage; and when it flowered last year, it was seen to be something new. It was carefully grown on again, and has been in flower all the winter. At the present time it is a beautiful picture of green foliage, and elegant spikes of bright yellow flowers. It is quite inter-

mediate in all its characters between *P. floribunda* and *P. verticillata*, as the following description will show:—The entire plant consists of a tuft of leaves and flower-spikes 1 foot high and wide; the leaves are 6 to 8 inches long, and 1½ to 2 inches wide, obovate spatulate, with a long petiole-like base, the margins wavy and dentate, in colour a bright green, showing faint traces of the mealiness characteristic of *P. verticillata*. The sepals are numerous, 12 inches long, slender, erect, glabrous, with from two to four whorls of large leafy bracts 1 to 2 inches long, and surrounding whorls of from six to ten flowers; pedicels very slender, ½ to 1 inch long, glabrous, slightly tinged with brown; calyx campanulate, green, with five regular acute lobes; corolla-tube 1 inch long, faintly mealy, otherwise quite glabrous, limb ¾ inch wide, and formed of five almost round notched lobes coloured bright buttercup-yellow. The hybrid evidently inherits from *P. floribunda* its exceptionally free and continuous flowering nature. Seeds were obtained from the plant last year, but they have not yet germinated.

ORCHID NOTES AND GLEANINGS.

"DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES."

THIS very useful publication is now published every two months instead of monthly as heretofore. An index to the plates representing each genus has been issued, so that if all the plates referring to a particular genus are collected into their appropriate portfolio with the index referring to them, it becomes easy to consult the work. This is one of the most unostentatious of the works devoted to the illustration of Orchids, and at the same time one of the most serviceable. The plates, though small, are accurate representations, and the text, of course, is thoroughly trustworthy. In the last two numbers which have reached us, the following species and varieties are figured:—

- ANGULOIA CLOWESII, Lindley.
- CATTLEYA ACKLANDIÆ, Lindl.—Brazil.
- CATTLEYA ATLANTA INVERSA, C. Warscewiczii, crossed by pollen of *C. Leopoldi*.
- CATTLEYA ATLANTA VAR. SPLENDENS.—Originating from the same cross as *C. atlanta inversa*.
- CATTLEYA ELLA, a cross from *C. bicolor* by *C. Warscewiczii*, Veitch.
- CATTLEYA GODESIANA × COGNIAUX.—Hybrid from *C. Schilleriana* by *C. Gaskelliana*.
- CATTLEYA LEOPOLDI VAR. PURPUREA.—Cogniaux.
- CATTLEYA REX, O'Brien, *Gardener's Chronicle*, 1890, viii., p. 684. Peru.
- CATTLEYA WENDLANDIANA ×.—From *C. Bowringiana* by *Warscewiczii*.
- COCHLODIA ROSEA, Benth.
- CYPRIPEDIUM A. DE LAIBESSE ×.—A hybrid from *C. Curtisii* by *C. Rothschildianum*.
- CYPRIPEDIUM MAHLERE VAR. DR. CLINGE DOORENBOS ×.—A hybrid from *C. Lawrenceanum* by *C. Rothschildianum*.
- DEIDORHIZA VICTORIA REGINÆ, Loher, in *Gardener's Chronicle*, 1897, I., p. 329; and 1897, II., p. 121, fig. 34. Philippines.
- EPIDENDRUM ATROPURPUREUM VAR. LONGILABRIS, Cogniaux.—New Granada.
- EPIDENDRUM XANTHINUM, Lindl.—Brazil.
- GRAMMATOPHYLLUM RUMPHIANUM.—New Guinea.
- LELIA XANTHINA, Lindl.—Brazil.
- LISSOCHILUS HORNSTALLI, Bateman.—Gaboon.
- MAXILLARIA STRIATA, Rolfe.—Peru.
- MORMODES BUCINATOR, Lindl.—Venezuela.
- MORMODES BUCINATOR VAR. CITRINA.
- MORMODES QUANA, Linden & Rehb f.—Ne × Granada.
- ONCIDIUM KRAMERIANUM, Rehb f.—Ecuador.
- ONCIDIUM REFLEXUM, Lindl.—Mexico.
- STANHOPE WARDI, Loddiges.
- VANDA SANDERIANA, Rehb. f.—Philippines.

PLEUROTHALLIS MACROBLEPHARIS AND P. BARBERIANA.

To the superficial observer these two species of *Pleurothallis* are much alike, and the first-named one was described by Reichenbach in these pages in 1874, and the second in 1881.

By an unpardonable horticultural error, more recently appeared a plant to which the name *Masdevallia culex* was given, and which Reichenbach identified as *Pleurothallis macroblepharis*. All

three are now in flower in Mr. R. I. Measures' garden, Cambridge Lodge, Flodden Road, Camberwell (gr., Mr. E. J. Chapman), where a very remarkable collection of this singular *Pleurothallis* and allied plants is in existence. The plants bear numerous slender flower-spikes, which are furnished with singular-looking, gnat-like flowers, having whitish ground, spotted and marked with purple. There is a slight colour difference which is not sufficient to warrant any but those with a special liking for such things growing more than one of them.

PLEUROTHALLIS ROEZLI.

The genus *Pleurothallis* is generally looked upon as of botanical interest only, although many of its members, when well grown, form handsome specimens. The largest and showiest is *P. Roezli*, which was discovered by Roezl about the year 1874, in Colombia. It is one of the Orchid specialties of M. Otto Froebel of Zurich, who sends examples culled from a quantity of the plant. Some specimens possess many long drooping racemes of rich claret-purple tinted flowers. The plants, about a foot in height, bear light green, leathery leaves, emerging from slender pseudo-bulbs, from which curve over the graceful spikes, which carry from ten to twenty claret-purple flowers, each about an inch in length, and of a fleshy substance. The flowers are produced freely, and last a long time in perfection, making a desirable plant for the cool-house.

CYPRIPEDIUM × FAVARGER.

In the collection of Frank A. Rehder, Esq., The Avenue, Gipsy Hill (gr., Mr. Norris), there has flowered for the first time a showy cross obtained from *Cypridium Charlesworthii* and *C. × concinnum*, which in size and form is one of the best of the *C. Charlesworthii* crosses, though in colour and general appearance, it resembles others of these crosses, among which so far there is a strong family likeness. The distinguishing features in this case come from the use of *C. × concinnum* (purpuratum × villosum) each of which may be traced in the resultant progeny. The broad, flat upper sepal is rose-coloured at the base, and white on the upper half, a series of dark chocolate-purple lines radiating from the base to near the margin. The petals are yellowish, with red-purple tinge and veining. The surface of the lip is shining red-brown.

ROMNEYA COULTERI.

THIS Californian Poppy is a worthy rival of the Tree-Peony, which it resembles in many points. It has been a favourite with plant-lovers for some time, but we hardly expected to find it in the back-garden of a town house. Our illustration (fig. 39, p. 131) however was taken on the premises of Mr. Gregory, the gardener-photographer at Croydon. The plant, though put out only two and a half years from a 6-inch pot, was 6 feet high, and as much or more through when our photograph was taken. The flowers are white, 6 inches across, the filaments purple. It is a native of California.

CHINA.

WINTER-HOUSES.—At the end of October it becomes necessary to put all pots of flowers and shrubs under shelter, and the device resorted to is both simple and effective. A building fronting south, and with a roof sloping from the front to the back, is constructed out of the soil itself, without any addition but water with which to puddle the soil before making the walls. The buildings vary in length, but otherwise are uniform in structure, and generally are either 25 feet or 37½ feet in length, and 16½ feet deep. The walls are made of mud, beaten flat with spades, about 7 feet high in the south end, and 3 feet in the north, and are about 18 inches thick. In the hollow from which the soil has been dug out to a depth of 2 feet, a few wooden supports are planted to carry a light framework of Millet-stalks, which is afterwards covered

with a coating 6 inches thick of mud. This forms the roof. The walls are on three sides only, and the south side is at first not covered in at all; but early in November a very simple framework of Millet-stalks is run up along its front from the soil to the roof, to receive the paper covering which keeps out the cold and lets in the light. The paper is quite strong enough to remain unbroken if there are no inquisitive cats or weasels about, and seems almost better than glass in retaining the heat poured into the house during the day by the sun, which in the winter months shines almost every day, and is, of course, fairly low in the sky. To

with the mud on the roof. The cost of building a house 25 ft. \times 16½ ft., is about £4. No heating of any kind is used, except that of the sun. The building will stand for years, needing little repair, except to the roof and front. The plants will remain in a healthy condition, with leaves green, and flower buds half opened, until spring moves everything into life with a rush.

Of course such a building would not be possible, except under similar conditions to those which exist at Tsientsin, viz., a light soil impregnated with alkali, no rain between September and April, and a bright sky. It is fortunate that the conditions are

CULTURAL MEMORANDA.

LOBELIA SPECIOSA.

SEED of this or other favourite variety for flowering in the summer should be sown forthwith, in preference to taking cuttings, as is the old method. Plants raised of well-selected strains afford excellent materials for bedding. Sow the seed evenly and thinly in well-drained prepared pans, filled with finely-sifted light sandy compost; and if pans are not available, then sow 6-inch pots, half filled with crocks, over which place a small quantity of moss

FIG. 39.—ROMNEYA COULTERI, AS GROWN IN THE GARDEN OF MR. GREGORY, BY WHOM THE PHOTOGRAPH WAS TAKEN. (SEE P. 130.)

keep the heat in and the cold out, curtains of reeds are dropped from the roof along the whole front of the house, reaching to the ground.

Inside the house a ledge, about 1 foot broad at the sides and 18 inches broad at the front and back, runs round the pit, which is of a uniform depth, and carefully levelled. The pots of flowers which need most sun are, of course, placed on the south ledge; and the shrubs, such as Oleanders, are stood in the hollow, near the back or close to the upright supports, leaving a passage-way in the centre of the building.

The only materials used in the construction of these houses are the soil on the spot, Millet-stalks, paper, a few wooden beams and supports, and a small quantity of broken hemp, which is mixed up

so favourable for building these winter houses, as frosts prevail from October to March, and the temperature occasionally falls below 0° Fahrenheit.

GRAPE VINES

are taken down in November from the walls or trellis-work on which they have been trained, and after being somewhat roughly trimmed, are laid in trenches dug 1 to 2 feet deep: earth is then piled on them to the height of 1 foot or 18 inches above the ground, and the surface is covered with puddled clay, and beaten hard with spades until it assumes an almost solid consistency. No further attention is paid to the Vines until the spring, when they are pruned and fastened again to their old supports. *Tsientsin*.

or siftings, filling up and press evenly and firmly. The seeds may be very lightly covered with sand or soil; make the surface smooth, and stand the seed-pots or pans in a house having a temperature of 60°, with a square of glass over them and a sheet of paper. When the seedlings appear, tilt the pans of glass, and after a few days remove it. Let the seedlings be pricked off before the roots get much entangled, as Lobelias, if once checked in growth, take a long time to recover.

LOBELIA CARDINALIS VARIETIES.

The seed of this species takes longer to germinate than that of *L. speciosa*, and it should be sown at about this date—even earlier is advisable. Strong plants, when put out in beds, make a brilliant dis-

play. This variety is comparatively hardy, but when left out usually suffers from damp. In order to obtain large plants that are sure to flower early in the summer, the plants that were lifted in October or November should have the side shoots taken off, together with some roots attached to each, and be dibbled into 60's, or, if great numbers are required, then into boxes and seed-pans, filled with light sandy soil. Place these in warmth of 60°, and as the season advances afford air freely after they are established, finally hardening them off in May, in readiness for planting-out at the end of that month.

PENTSTEMONS.

These plants treated like the shrubby *Calceolarias*, may be raised from seed sown forthwith. Given fair treatment the seedlings flower well the current year, and make excellent subjects for filling large beds in the flower garden. As border plants, they make a good show, and flowers are useful for cutting.

VERBENAS

are not now much grown as was the case years ago, probably owing to the plants being attacked by mildew, &c. Notwithstanding this defect, where much bedding out is called for, the Verbena is a very useful plant. It comes true to colour, and if seeds of separate colours are sown at this date, and the plants get good attention, strong plants are available by the end of the month of May. Verbenas winter well in cold frames, with a little protection afforded from mats, &c., and such stock plants, when placed in mild warmth in February and March, quickly throw out plenty of shoots fit for making cuttings, which readily strike in a bottom heat of 70°, and a top heat of 60°. *H. Markham.*

FLORISTS' FLOWERS.

CHRYSANthemum SPORTS.

NOTWITHSTANDING the rapidity with which new seedlings can be raised and put into commerce, there still seems to be a kind of sentimental regard for sports from popular varieties. Several of these made their appearance last season, but whether they are in any way improvements on the older forms, the cultivator and exhibitor will ultimately decide. For instance, there is a pure yellow sport from M. Chenon de Leché which, considering the many good yellows we have already, is hardly likely to displace any others; the charm of the parent being in its peculiarly soft mingling of colour. Mrs. Tate is a warm terra-cotta sport from Etoile de Lyon, one that for size had no equal in its day. Madame von André is a pale sulphur-yellow sport from Mutual Friend, a big white Japanese of American origin. Eastman Belle looks like a very promising sport, inasmuch as its richness of colour and its earliness are alike useful; its parent is President Borel. Then we have a good yellow sport from Madame L. Remy, called M. L. Remy; this is one of the Mrs. C. Harman Payne family, and one of the purest in tint. Another from the same source is Mr. A. Barrett.

Among decorative varieties the old La Triomphe has given several sports; and O. J. Quintus has produced a white form that seems to be much valued by those who require free-flowering bush plants. *C. H. P.*

CARNATIONS

That are intended to flower in pots will presently have to be repotted. Those not needing repotting will, if the soil be filled with roots, need more water than heretofore; moderation in this matter should be the rule. Free ventilation should be afforded in mild weather, and a small amount always when no actual frost exists. The surface-soil should be kept stirred. These measures will help to keep the plants healthy. If aphides exist on any of the plants, separate the

latter from the rest and apply tobacco-smoke. If but a few plants are infested dip them in soap-suds, to which some tobacco-juice is added.

Now that the varieties of the florists' Carnations have increased in number, and been improved for outdoor growth, fewer plants are now flowered in pots than formerly. In the matter of pots, in which to flower the plants, it may be said that those of 10 inches diameter will accommodate three vigorous plants easily, and a 9-inch pot two plants or three weak ones, while two will be enough for an 8-inch, and in some cases a 7-inch one will give sufficient space for good development. A suitable soil for Carnations consists of two parts rich pasture loam, to which one part of half-decayed horse-dung and leaf-mould is added, together with sufficient sharp pit or sea-sand as will make it porous, less if the turf be light, and *vice versa*. Let the plants be kept under glass, and ventilate freely. When the plants may be stood in the open air I will again allude to the subject of staples, manures, &c.

The Tree-Carnations may now be propagated from slips inserted thickly in sandy soil in 4-inch pots, plunging the same in bottom-heat of 80°, and top-heat of 55°. Failing other means, pots of 8 inches in diameter may be utilised, striking the cuttings so low that a sheet of glass may be placed over the top of the pot, and top-heat afforded in other ways. In any case, the frame, &c., must be relieved of its moisture, or the slips will go down like snow in sunshine before the *comnus fungus*, the cause of "damping off," and with this intent day and night ventilation is very necessary in order to obtain a good strike. When rooted, pot off singly into thumbs or 60's, using a light compost consisting of leaf-mould and sharp sand. Place the young plants on a shelf close to the roof in a temperature of 50° to 55°, and after a lapse of three weeks inure them to cooler conditions. *E. Molyneux.*

FOREIGN CORRESPONDENCE.

PALMS, THEIR AGE WHEN PLANTING, &c.

I READ lately a short notice in the *Gardeners' Chronicle* accompanying a beautiful figure of a specimen of *Archontophoenix Cunninghamiana* (Wendl. & Drude), growing in a garden in Southern California. Will you allow me in the interest of readers, who like myself once dreamed of making a garden of tall, majestic Palms, to make some observations, based on nearly a dozen years experience.

When the age of a plant is stated, and no express explanation given, it can only be understood as the time which has elapsed since the germination of the seed (as in the case of the two Palm-species named in the notice, neither of which can be multiplied in any other manner than by seed), or in the case of plants raised in other ways, the time which has elapsed since the plant had a separate existence, and the time the branch, slip, layer, sucker, &c. formed part of the mother plant. Now it is a very common thing where planted out in the open, to omit to mention what their age was when planted out. Though I have had my attention naturally very much applied to the question of the growth of Palms in the open ground under different conditions of soil, exposure, and climate, I shall not venture to express any opinion as to the age of the two Palms in question in the notice; but I have no doubt that their age is much above that stated, though they may have grown in the open ground for twelve years only.

I lived for some time in Southern California, but I did not observe a more rapid growth in general of Palms, than in well situated gardens here. I have myself, for about eight years, possessed a garden here, where I try to bring together as many species of Palms as it is possible to cultivate in the open air. Like others, I have found most Palms (there are exceptions, as the *Washingtonia*, Wendl., for instance) to grow very slowly in the first years of their life, and several

Palms (as the genera of *Sabal*, *Nannorhops*, Wendl., and others) are always very slow growers.

The species which, in Southern California, goes under the name of *Cocos plumosa*, and which may or may not be the *C. plumosa*, Martius, is like the other *Cocos* species, known to me (I think that *C. nucifera*, L., makes an exception) as a plant of slow growth when young, even when planted out in the open ground immediately it has developed its two or three first seedling-leaves. I have a number of such seedlings growing in the open ground, but I would advise anyone wishing to make a garden of *Coco Palms*, which are certainly the most beautiful plants which can be grown in the open in this part, to plant specimens as large as they can obtain, otherwise they will have to wait for many years before they can have plants of a highly ornamental character. *A. R. Proschowsky, Grottes St. Hélène, Chemin de Fabron, Nice.*

EARLY FIGS AT GUNNERSBURY HOUSE.

IN order to have Figs ripe in the middle of February, the appliances at the gardener's command must be of the best, and the cultivation must follow suit, it being no easy matter to command success by ordinary methods. To prove that Mr. Hudson understands Fig-culture thoroughly, the visitor has but to inspect the Fig-houses and note the crops of fruit on the pot-trees. I have never observed a fuller crop, even when three months later in the year, than is to be found there at the present time. One great difficulty in growing Figs is the falling of the fruit, but at Gunnersbury it would be difficult, among the great number of trees grown, to find one that is carrying a scanty crop. The cultivation of fruit-trees in pots is a specialty at Gunnersbury, and Figs are largely cultivated for early as well as late supplies. I may remark that Figs are placed very close together in a house with a north aspect, so as to retard growth, which look as if they would afford good crops next autumn, the growth being very hard, and the points of the shoots masses of embryo fruits, now just discernible.

For late autumn-fruiting, Mr. Hudson grows *Negro Largo*, *Nubian*, *Bourjassotte Grise*, and kinds noted for their richness, which are less suited for early work; and though one does not like to chronicle one's failures, I may state that I have forced the above-named Figs with very poor success for early crops—and I note Mr. Hudson does not advise their employment for first crops. I will note the varieties, which are few, viz.—*St. John*, which is largely grown, and rightly so, a very heavy-cropping Fig, in 10 and 12-inch pots, three to four dozen of large fruits being borne on each. This variety is greatly liked for its freedom to fruit early, it retains its fruit well from the start, and needs severe thinning. Many gardeners, including myself, would have feared to leave so heavy a crop; but in this case the roots are in good condition, and the crop is finishing well, with fewer losses this season than previously. Another variety is *Pingo de Mel*, with a fruit not unlike the *St. John* in colour, and an excellent bearer. Plants of this variety at Syon assume a more spreading habit than *St. John's*. I have seen it stated that these two varieties are identical, but I am not of that opinion, and I regret that I did not ask Mr. Hudson's opinion on this point, as, growing such quantities, he has reliable data to go upon. Another early variety is *Violette Sepor*, a richer-flavoured Fig than those previously named, but not so free, although a valuable variety, which forces well. There are other varieties grown, but not so extensively, for late supplies.

In a succession Fig-house there were noted excellent crops of fruit of about half their full size, consisting of early and later varieties, but mostly of the varieties named. The plants are shapely, and of large size, with clear stems, and compact crowns such as is seldom observed. I noted that in the earliest fruiting trees the shoots are not so closely stopped as with later fruiting ones.

At Gunnersbury no secret is made of the method

of cultivation; the trees are repotted annually in the same way as a Peach or Nectarine or other pot fruit-trees. The trees are partially shaken out and repotted early in the autumn. The London smoke-laden fogs so prevalent in the district in winter have not been so prevalent this year, and the trees have not suffered much. It is sometimes asserted that the varieties which I have named for

conditions; indeed, the plant was described as a scandent shrub by Mr. James Britten, the author of the species. The leaves are remarkable in having very large basal auricles, and a curiously reniform blade, the largest being $3\frac{1}{2}$ inches by $2\frac{1}{2}$ inches, dentate, glaucous beneath, dark green above. Flowers bright yellow, in large loose corymbs, each head over an inch in diameter, and composed

B. grandiflora, B. coccinea, &c. Thus separated, the plant under notice would be grouped with *M. uniflora*, which it resembles in all characters except the colour of the flowers, which are bright buttercup-yellow, with a green stripe down the back of each segment. There is also a difference in the length of the scape, which in *B. Sellowiana* does not exceed 3 inches. Numerous examples of this plant have been in flower all the winter in a cool greenhouse at Kew. They were introduced from Montevideo two years ago, along with the pretty little *Crocus-like* Haylockia and other interesting bulbous plants of Uruguay. This is also the habitat of *B. uniflora*. Probably the new-comer will prove as hardy as the last named—at any rate, in the warmer parts of these islands. W. W.

LACHENALIA PENDULA.

A pot of flowering-plants of this handsome species of *Lachenalia* in the Cape-house at Kew reveals a considerable range of variation in the colours of the flowers, and also in the stature of the whole plant. The tallest spike is 17 inches high and $\frac{1}{2}$ in. in diameter, and it bears a dozen flowers, each $1\frac{1}{4}$ in. long, and coloured orange-red, with deep purple and green tips. A second one has a scape a foot high, with flowers of a paler colour, almost yellow, whilst the tips are bright emerald-green, with only traces of purple. Still more remarkable is a third one, which has a scape 9 inches high and flowers 2 inches long, coloured like that first described, with the addition of a rich mottling extending over all parts of the segments. This is a beautiful form, probably the richest in colour of all *Lachenalias*. *L. quadricolor*, another beautiful plant, is also in flower in the same house. Mr. Baker makes this a variety of the well known *L. tricolor*, but it more closely resembles *L. pendula*. W. W.

SCOTLAND.

ABERDEEN NATURAL HISTORY AND ANTIQUARIAN SOCIETY.

THE naturalists had a delightful and instructive meeting in Aberdeen University on Friday evening, February 23. There was a capital attendance, and Dr. James W. H. Trail, Professor of Botany in the University, and President of the Society, occupied the chair. The chief business was a lecture by Professor Thomson, Aberdeen University, on "The Animal Life of the Sea-shore." Dr. Trail, in proposing a vote of thanks to the lecturer, said the object of the society was to work up the natural history of the district, and, as co-operation was the only way in which that could be done, he would be delighted to receive as many recruits as possible, and also any suggestions they may have to offer. The society now numbers over 200 members, and many new names were added on Friday evening.

THE WEATHER IN WEST HERTS.

SINCE the recent frost broke up about ten days ago, the weather has been gradually getting warmer. Indeed, the last five days have been very nearly as unseasonably warm as the five coldest days during the frost were as unseasonably cold. On the warmest night the exposed thermometer never fell lower than 46° —making this the warmest February night for six years. Notwithstanding the sunless character of the last four days, the temperature of the ground during the past week has rapidly risen, so that at the present time it is 2° warmer at 2 feet deep, and as much as 5° warmer at 1 foot deep, than is seasonable. Rain has fallen on each of the last ten days to the aggregate depth of nearly 2 inches.

FEBRUARY.

This was in many respects a very remarkable month. Taken as a whole it was rather a cold February. The most noteworthy feature, however, as regards temperature was the great difference

FIG. 40.—*BRODIAEA SELLOWIANA*: COLOUR OF THE FLOWERS YELLOW.

(From the garden of Mr. Worsley, Mandeville House, Isleworth.)

early forcing are not of good quality, but if the treatment of the plants is what it should be from first to last, there will be no question as to their quality. G. Wythes, Syon House, Brentford.

KEW NOTES.

SENECIO AURICULATISSIMUS.—An interesting and probably also useful garden plant has recently been introduced into Kew from British Central Africa, and is now flowering in the conservatory. It has thin, wiry, freely-branched stems, which look as if they would be more or less scandent under natural

of about a dozen ray-florets surrounding a small disc. The species was collected on Mount Milanji by Whyte. The Kew plants were raised from seeds collected and forwarded by Mr. Mahon, of the British Central African botanical department, who thought they were from *Cineraria Kilimandscharica*, also a native of that region, but quite distinct from the plant under notice. W. W.

BRODIAEA SELLOWIANA (fig. 40).

For garden purposes, this should be called a *Milla* rather than a *Brodiaea*, limiting the latter name to those plants with flowers in umbels, e.g.,

between the weather of the first fortnight and the rest of the month. To give an extreme example, on one night during the cold period above mentioned, the exposed thermometer indicated 23° of frost; whereas on another night towards its close, it never descended lower than 46°—a difference of as much as 42°. Rain or snow fell at frequent intervals to the total depth of over 5 inches, or considerably more than double the February average. About one-third of this large quantity was deposited in the form of snow. The very exceptional character of this fall will perhaps be more readily understood when I explain that it would be equivalent to a watering of 24 gallons on each square yard in my garden. In no previous February during the last forty-five years, has the rainfall at Berkhamsted been as heavy, and only four times before during the same period has such a large quantity been deposited in any winter month. The record of bright sunshine fell short of the February mean by about twenty minutes a day. The winds were variable in direction, and, as a rule, of about average strength.

No sooner did the frost come to an end than the earlier spring flowers began to make their appearance. A selected bush of the wild Hazel first showed a fertile flower on the 22nd, which is five days later than its average date in the previous nine years, and later than in any of those years with the exception of 1895.

THE WINTER.

The past winter, when considered as a whole, was of about average temperature. During the course of it there occurred two distinct periods of cold weather, the first lasting about a fortnight in December, and the other for three weeks in February. The total rainfall amounted to about 10½ inches, which is about 3½ inches in excess of the average for the season. It was a rather sunless winter, but the departures from the mean were in this respect in no way remarkable. *E. M., Berkhamsted, February 27.*

WEEDS.

THE Scotsman of the 18th inst. contains a long article on this subject, in the course of which the writer mentions that *Eichornia crassipes* has taken possession of certain ponds in England. We think the writer should in this case have been particular in verifying his references, or in giving his readers the opportunity of doing so.

In South Africa, we are told, it is remarkable, how small is the influence that plants introduced from Europe exert on the aspects of the vegetation, and how weak is their aggressive power as against that of the indigenous flora. It may be readily supposed that the heat and drought of the climate of South Africa is unfavourable to European plants. The number of introduced plants is few, and chiefly confined to weeds of cultivation, which are never found far from road-sides or human habitations. Those of American origin are more prominent, and, according to the official handbook of the Cape of Good Hope, the prickly Pear is the most abundant. It is a terribly troublesome pest, growing in some places sub-socially and killing out the native vegetation. So tenacious of life is it that a piece of stem of a few square inches dropped upon the surface of the hot dry soil will take root and grow readily. Its eradication is slow and laborious, needing either to be completely buried or burnt.

Mr. Mark King, who has made a study of poisonous and noxious weeds in the neighbourhood of Edinburgh, says that the black Nightshade (*Solanum nigrum*), not a common plant anywhere in Britain (common enough near London, E.), has lately made its appearance on his ground at Bonnington. It was first noticed as a small plant growing among *Mignonette*, raised from seed sent from Germany. It was allowed to ripen and shed its seed, and has since sprung up year by year. The spread of this plant is slow in comparison with many other weeds. The yellow Vetchling, *Lathyrus Aphaca*, made its appearance a few years ago in great profusion in Methven & Sons' nurseries. It was supposed to have been introduced from the south of England among the seed mixed in the soil of the plants sent from that place. But, curiously, the plant never sprang up again. Being an annual, its disappearance was probably owing to the want of sun to ripen the seed. Among others spreading in cultivated ground in the neighbourhood of Edinburgh, he mentions the creeping bell-flower, *Campanula rapunculoides*, and the small Bindweed, *Convolvulus arvensis*, and says that it is only within the last four years that the ground in this district has been infested with these weeds. The small Bindweed is a very troublesome pest, and one of the most difficult to get rid of, as the smallest portion of its creeping root starts to grow on separation from the parent plant. Besides,

however, the damage resulting from their presence by encumbering the soil and infesting the crops, weeds harbour insects and fungi injurious to cultivated plants. Many insects and fungi live on weeds, upon which they thrive and multiply, and thus keep up their number ready to attack their favourite cultivated crop as soon as it is left unprotected. Even in Pine nurseries, where weeds are but little to be feared, there are two which should never be tolerated, the Groundsel, which harbours in its early stages a fungus destructive to young Pines, producing so-called "cankers" as disastrous as those of the larch disease, and the sheep's Sorrel, which is fond of acid-land, and when once it has gained a footing there it grows with extreme rapidity, throwing out in all directions a network of knotty underground stems, which bind the soil, and each of which sends up numerous shoots.

The work of destroying weeds should be systematically undertaken throughout the country. Ballast weeds, roadside weeds, and railway weeds should be watched for and destroyed before they become weeds of the farm or garden. Laws are enforced in the United States to check the production of weeds, and if the practice of destroying weeds in this country were only made general, it would cut off one of the principal avenues for the introduction of insects and fungi injurious to field and garden crops. *A. B. S.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Figs.—Where the young fruit is advancing in size, a rise of temperature to 60° to 65° at night, and 10° higher by day, may now be afforded; and this increase should be accompanied by a greater degree of humidity. The syringe should be freely used on the plants every day in the afternoon, and every part of the foliage and fruit wetted as a means of preventing the lodgment of red-spider. Water should be freely afforded at the roots of trees in pots and borders. The former should be carefully watched for any appearance of stagnation, or sourness in the soil arising from this or other causes. Usually it is the drainage which is at fault, and if this be put right all will go well. Any neglect of this precaution causes the young fruit to turn of a yellow tinge and drop off. The Fig is a gress feeder, and quickly exhausts the nutriment contained in a small potful of soil; this being so, liquid manure should be freely applied to all trees growing in relatively small borders, pots, and tubs. A top-dressing of fibry loam and well rotted dung will be of great assistance to trees in pots which are carrying heavy crops of fruit. To enable this top-dressing to be laid on the surface, strips of zinc long enough to encircle the pot and about 4 inches deep should be placed just within the rim, the added soil, &c., being firmly rammed. A little more care should be exercised in affording water until the roots permeate the fresh soil.

Vines.—If there is any planting to be done, and the borders have been already prepared and the Vines pruned to the requisite height, the sooner the work is carried out the better. A long season of growth is of great advantage, and especially is early planting necessary if the Vines will ultimately be subjected to severe forcing. Old canes, one year old, are best for planting at this season, and it is usual to secure those that are just on the move at the time they are planted. This is not necessary, however, as the Vine, being a deciduous plant, may be planted with perfect safety, and with a better prospect of ultimate success when in a dormant condition. This I have proved many times over. In planting, whether from pots or boxes, all the old and sour soil should be carefully shaken from the roots, which should be spread evenly in all directions, and covered with a few inches of specially prepared compost, consisting of sweet fibrous loam, a little fine charcoal, and coarse sand. Afford sufficient water to settle the new soil about the roots. The young roots will need to be tied securely in their positions. It is wise in all cases to put in supernumerary rods. They afford a double advantage: the first being an earlier return of fruit, and the second that the permanent Vines need not be heavily cropped before they are thoroughly established. The rafters of the house frequently decide the distances at which permanent Vines are planted, whether these be 3 or 4 feet apart. Five feet apart, however, is a good distance to allow, so that there may be obtained a fine spread of foliage and good laterals capable of supporting fine bunches of fruit. After planting, keep the house closed, but use no fire-heat, while a temperature ranging between 45° and

55° can be maintained without it, and afford the rods an occasional spraying with the syringe. It is important to start slowly, so as not to force the rods into leaf before the roots have commenced to extend; but once root-action has fairly commenced, more liberal treatment of the Vines will be beneficial. To those who may have to plant ranges of houses, the following varieties chosen to give a continuous supply of fruit may be useful. For early forcing, Black Hamburg, Foster's Seedling, and Diamant Traube, the latter is the best early white variety we have. It is very free in growth and fruitful, forces well, is of high quality, and fine appearance. It will displace Foster's Seedling and Buckland Sweetwater. For mid-season supply, Madresfield Court, Muscat Hamburg, and Black Hamburg, are the best black varieties; while Muscat of Alexandria is the best white. For late houses, Gros Guillaume, Gros Colmar, and Lady Downe's Seedling are reliable black Grapes; while Muscat of Alexandria, Mrs. Pearson, and Chasselas Napoleon are first-rate whites. The last-named varieties should be freely planted, as it is unsurpassed as a late white Grape.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WISE, Bart., Clare Lawn, East Sheen, S.W.

Aerides.—All species of *Aerides* seem of late years to be less grown than formerly, though at their best they have a singular beauty. After any of the species has remained inactive since the autumn, renewed activity will now be observed at the tips of the roots, which first become green, and then of a pale amber tint. It is at this stage that the exhausted materials, the dead roots, and loose crocks should be removed from the pots and replaced with living sphagnum-moss and clean crocks. *Aerides* can be grown in Teak-wood baskets in pots, and wooden cylinders equally well, and in each case the drainage should occupy three-fourths of the space, and sphagnum-moss the remainder. The long roots may be tied round the baskets, &c., and they will mostly throw out new ones at different points. *Aerides* grown in pots may be reduced in height if they have become unsightly in consequence, removing the basal part of the stem, at the same time breaking the pot if any roots adhere to it, putting the bits of pottery to which roots are attached into a clean pot. A plant growing in a basket or cylinder may remain undisturbed until the bars decay, and a new one becomes necessary. *Aerides* Fieldingi, *A. crassifolium*, *A. crispum*, *A. japonicum*, *A. odoratum*, and *A. Warneri* will thrive in the house with the *Cattleyas*. *A. Vandarum* does best in a cool one, and most of the other species in the East India-house. Until such times as growth is more active, and the evaporation of moisture more rapid, water should be only sparingly afforded, as too much moisture in the materials during the spring is injurious; although a growing atmosphere, with frequent gentle sprayings afforded, and damping down between the plants in favourable weather, do much to promote growth.

Vandas.—Many species of *Vandas* will now stand in need of similar attention to those afforded *Aerides*; *V. Sanderiana* is one of those that should be taken in hand, hanging the plant in the warmest house, and affording it shading in moderation, and as much water as will keep the sphagnum-moss moist. *Vandas* Bensoniae, *Denisoniae*, *insignis*, *lamellata*, *limbata*, *Parishii* and *Roxburghii*, are likewise found to thrive when grown in baskets, and hung up to the roof. *Vandas gigantea*, *lissocilioides*, and *Batemaniana*, being unwieldy plants, are best grown in pots, and stood in a sunny part of the East Indian-house, treating them similarly to the first-named in the matter of water. *Vandas Amesiana* and *Kimballiana* do not grow satisfactorily in some gardens. Here we get a fair return from *V. Amesiana* by growing the plant with the *Phalenopsis* in a part of the house where the heat is least, and a fair amount of sunlight can be afforded it. *V. Kimballiana* is a subject for the intermediate-house, succeeding when it has plenty of ventilation and humidity, and shade in moderation during the summer. It needs very little water at the root during the winter. The last two species should be placed in baskets, and hung up to the roof. Any renovations may be carried out at this season. *Vanda cœrulea* and those of the *V. suavis* and *V. tricolor* sections should be left undisturbed at the root until March.

Shading.—On sunny days, many Orchids whose flowers are of a delicate texture, are readily injured by the sun, such as *Cypripedium superbum*, *C. callosum*, *C. Sandersi*, *C. Lawrenceanum*, *Hycanum*; and the *Bollesia*, *Pescatorea*, *Anectochilus*, and *Phaius tuberosus*, will require to be shaded more or less. Where these plants are few in number, they may be shaded with sheets of tissue-paper, instead of applying shade to the whole of the occupants of a house. Meantime, all blinds should be got in readiness for use.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

General Remarks.—The weather having become milder, the temperature of stoves may be 70° at night, and 75° by day, rising with sun-heat to 80° or 85°. The paths and stages should be frequently damped, and recently potted plants may be encouraged to root freely by maintaining a humid atmosphere. No time should be lost in getting blinds fixed for shading; the sun now getting stronger each day. A light spraying overhead by means of the syringe is very refreshing to *Primulas*, *Cyclamens*, &c., in flower, when any signs of flagging are noticed. Repot *Eucharis*, *Hymenocallis*, and *Pancratium*, if necessary; using good turfy-loam and sand, to which may be added a small quantity of bone-meal and dried cow-dung. When established, these plants require an abundance of water, and should be cultivated without check. Pot up cuttings of *Codisums*, &c., as soon as they have rooted; and propagate *Selaginellas*, *Oplismenus* (*Panicum*) *Burmanni*, *Zebrinas* (*Tradescantia*), &c. Where there are permanent edgings of *Selaginella denticulata* and others, the present is a good time for making these good or for renewing them. If it is not necessary to replant, some fine loamy soil and leaf-mould or rotten manure may be given as a top-dressing. *Caladiums* may be divided for the purpose of increasing the stock, and others may be potted-up entire.

The Conservatory, &c.—Admit air freely when the weather is favourable, and as far as possible dispense with fire-heat; remove all dead leaves and flowers from the plants each day. The creepers and climbing-plants should be thinned-out, and the growths to be retained regulated and cleaned. If mealy-bug is found on such plants as *Tacsonias*, sponge the leaves and stems with insecticide, and paint the rafters and any crevices with paraffin.

Violets, &c., in pits.—Remove decayed leaves, afford the plants water, and remove the sashes entirely from the pits during the day. Carnations for winter flowering may now be propagated on bottom heat.

Forcing-house.—Introduce succession batches of *Hydrangeas*, *Callas*, &c. The yellow *Callas* require more heat than the white ones, and a lighter peaty compost, with a liberal amount of pot room.

THE FLOWER GARDEN.

By J. BEEBOW, Gardener to the Earl of Hereford, Abbotsbury Castle, Dorset.

Soils and Leaf-mould.—The present season is, perhaps, the best for the preparation of a variety of soils and leaf-mould. Both are required in quantity in all country gardens for potting, and as dressings for beds and borders. In cutting pasture turf, the country gardener, who is fortunately placed that he can get his turfy soil from the home estate, selects the present month for cutting and carting, because the land is moist, and cutting and stripping therefore easy work. He needs not to be told that rich loamy soil yields the best turf, being full of roots dead and living, excellent in every way for plants. The soil, if it be very good, may be dug 6 inches deep, and that of poorer quality "raced" out 1 foot in width, and raised 2 to 4 inches thick with the turning-iron, the length being anything between 1 foot and 3 feet. A turf stack should have its form marked out with stout pegs, and within these lines the turves should be laid in courses like brickwork, and fresh horse-dung and some soot should be strewn between the courses, not being lavish in the use of the latter. The stack may be built from 4 to 10 feet high, and finished off with a saddle-back that will keep out the rain in great part. It is very essential that no herbage is allowed to grow on a loam-stack, for should weevils exist in the turf, living vegetation would afford these beetles and their larvæ food,

and enable them to live, and become a great nuisance to the gardener.

Leaf-mould.—Tree-leaves contain much of the nutriment demanded by plants, hence its value to the flower gardener. By itself it is, for most species, too porous, but mixed with loam in varying proportions, it greatly aids the growth of many different species. Perhaps the best sort of leaf-mould obtainable in this country is that of the Oak, Beech, Sweet Chestnut, and Hornbeam. The leaves should be collected free from sticks and stones, and placed in a shallow depression of the ground, being hurdled round to keep the mass together. A heap may be built from 5 to 10 feet high, and it should be turned the sides into the middle after decay has set—say, the following autumn. This operation will hasten decay, but there will be no available leaf-mould till well into the second year. By that time the heap will have shrunk considerably, and much of it at the bottom will be decayed wholly or in part, and may be put through a screen or sieve with 1-inch meshes, the refuse being returned to the heap to still further decay. At intervals of six months this sort of screening and sorting must be repeated, till the entire mass is decayed, the useable leaf-mould being stored by itself under cover. By this method of proceeding there will be three different heaps of leaves in as many stages of decay.

Seedlings.—Seeds the sowing of which has been advised in former issues, viz., *Acacias*, *Begonias*, *Melanthus*, *Cannas*, &c., should be pricked off as soon as they can be handled easily. These fragile plants are liable to damping-off if afforded much moisture, or the pots and pans not very well crooked. Let the pans, &c., stand near the glass in the same warm house the plants were raised in, and when once growth is renewed inure them gradually to more fresh air.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Strawberries planted out last autumn will require to be looked over, and if any of the plants have been loosened by the recent frosts, they should be made firm again by treading the soil. The ground between the rows, if sufficiently dry, may afterwards be loosened with a hoe. Runners that were set out in nursery rows last autumn should be planted into their permanent positions. If the positions have not yet been prepared, the work must now be hurried on, and the planting deferred until the soil has settled. These plants will not bear much fruit this season, and the ground between them may be utilised, if desired, for the growth of Lettuces, or some such crops. Old plantations will need manuring, but previous to applying this, clean the plants from dead leaves; and if there are weeds, hoe and rake the ground. Place the manure between the rows, and in spreading it subsequently, work the manure well up around the collars of the plants. A little old potting-soil added to the manure is an advantage, and if it be made firm round the collars, the plants will soon push out an abundance of roots into it. Spent Mushroom and hot-bed dung make capital manures for Strawberries, but if these cannot be obtained, use must be made of artificials. Soot is a good stimulant, and with a little lime added it proves beneficial on some soils. These and any artificial manures should be strewn over the surface, which should then be lightly hoed or forked over. Digging with a spade between rows of Strawberries should not be practised.

Preparation for Grafting.—All trees intended to be regrafted during this spring should be headed back to within a few inches of the points where it is intended to insert the scions. The final cutting back is best done at the time the operation of grafting is performed. Secure the necessary scions at once, and heel them in on the north side of a hedge or wall, if this has not already been done. For the grafting of established trees, wood of two years old should be preferred. Wood made last year will answer well for younger trees, and for thin stocks.

Miscellaneous Kinds of Work.—During inclement weather, when the men are unable to get on the ground, a variety of jobs may be done, namely, shreds cut for future use, old wall-nails sorted, roasted in a shovel over a fire, and whilst hot dipped in linseed oil; and usable old shreds may be boiled in soda and water, in order to kill insects

and their eggs. The old wall shading and blinds may need repairing and new ones making; also wooden pegs of all sorts, including those for holding the blinds and nets away from the surface of the walls.

The Fruit-room.—Most varieties of Pears are now past their best, or over. The variety *Bergamotte d'Esperen* has again proved itself to be the best late Pear here, the fruit having been in use all through the month of January. Apples are keeping well, and many varieties, though past their proper season, still retain their flavour almost unimpaired. The remaining fruits of all kinds should be carefully sorted and inspected weekly, and any that show signs of decay removed. Keep the room cool, and avoid draughts from windows and ventilators—stillness of the air and a rather low temperature being best for Apples late in the season.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain Holwood, Westonbirt, Tetbury, Gloucestershire.

Onions.—The ground for this crop requires to be richly manured yearly, but it is better to change the position of the bed. An open situation upon a fairly dry sub-soil, and where the Celery was grown last season, is one of the best. The trenching, exposure to air, and previous manuring given the soil for the needs of the Celery, would save further work of that sort now. When the ground is dry enough to be easily worked, it should be levelled and made firm by treading. If possible, the sowing should be completed by the middle of March. Sow the seeds thinly, and as evenly as possible in shallow drills about 1 foot apart, and cover them lightly with soil. If the weather be wet, the surface of the bed should be sprinkled occasionally with soot and wood-ashes, to prevent the worms from drawing down the leaves. Where medium-sized, well-ripened bulbs are required, it is perhaps better to adhere to the practice of sowing out of doors, although if seeds be sown in boxes, and the Onion-plant afterwards transplanted, finer bulbs may be obtained. But there is the danger that these would be but half ripened. Among the many excellent varieties are Veitch's Maincrop, Brown Globe, Holborn, James' Long Keeping, and Nuneham Park; while for the larger single bulbs, Ailsa Craig, and Cranston's Excelsior may be recommended.

Parsnips.—Ground that was deeply trenched and liberally manured last autumn, should now be made level for the reception of Parsnip-seeds. Seeds should be sown by the middle of the present month. A good open situation, and a sandy loam, or a rich soil of not too stiff a nature, is required for this crop. Sow thinly in shallow drills, about 18 inches to 2 feet apart, and rake evenly over. The most reliable varieties are Carter's Maltese, Hollow Crown, and Veitch's Improved Hollow Crown.

Cucumbers.—Seeds should be sown now in pots filled with a light rich soil, and if placed in heat, they will produce plants ready for transplanting into heated pits or frames by the beginning of April. As varieties for early fruiting, choose those which have a hardy constitution, and are free bearing, such as Cardiff Castle, Telegraph, and Lion House Improved.

Miscellaneous Seeds.—Sow now in boxes filled with light, friable mould, seeds of Brussels Sprouts, Cabbage, Walcheren Cauliflower, Early Broccoli, Lettuce, and Leeks, and put them in cold frames. A further sowing to produce later plants may be made three weeks hence. Tomato, Capsicum, and white Celery seed may be sown in heat, but remove the Celery when germinated to a cool structure.

General Work.—Cut a supply of sticks suitable for staking Peas and Beans, and in wet weather get these pointed and shortened to the length required. The taller-growing varieties will need freshly-cut sticks, but for those of dwarfier growth, old sticks may be used. If the straw upon the out-of-door Mushroom-beds has become very damp, or decayed, a fresh supply should be afforded; where the Mushrooms are showing, sprinkle lime and soot round the edge of the bed in order to destroy slugs and snails.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR MARCH.

THURSDAY,	MAR. 1—	Linnean Society, Meeting.
THURSDAY,	MAR. 8	{ Manchester and North of England Orchid Society, Meeting.
TUESDAY,	MAR. 13	{ Royal Horticultural Society's Com- mittees, Meeting.
THURSDAY,	MAR. 15—	Linnean Society, Meeting.
WEDNESDAY,	MAR. 21	{ Torquay and District Gardeners' Association, Exhibition.
THURSDAY,	MAR. 22	{ Manchester and North of England Orchid Society, Meeting.
TUESDAY,	MAR. 27	{ Royal Horticultural Society's Com- mittees.

SALES.

- MONDAY, MARCH 5.—Roser, Azaleas, Fruit-trees, Hardy Perennials, &c., at Protheroe & Morris' Rooms.
- TUESDAY, MARCH 6.—Unreserved Sale of the Collections of Orchids formed by H. Tate, Esq., of Allerton Beeches, Liverpool, on the Premises, by Protheroe & Morris. at 12.30 o'clock (two days).
- WEDNESDAY, MARCH 7.—Japanese Lilies, Ornamental and Decorative Palms, Roses, Continental plants, &c., at Protheroe & Morris' Rooms.—Sale of Building Frontages, Nursery Land, and Glass, of Victoria Nursery, Enfield Highway, N., by Mr. H. W. Rendell, 90, Queen Street, Cheapside, E.C.
- FRIDAY, MARCH 9.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41° F.

ACTUAL TEMPERATURES:—

LONDON.—February 28 (6 P.M.): Max. 51°; Min. 39°.
Easterly wind; fine.

PROVINCE.—February 28 (6 P.M.): Max. 44°, W. Ireland;
Min., 37°, N.-E. Scotland.

Should Chiswick
be Abandoned?

THIS is a question which, with other even more serious proposals, deserves the most careful and anxious consideration on the part of horticulturists. It is true that the centenary of the Royal Horticultural Society is still some three or four years off, but if the schemes mentioned at the annual meeting of the Society are to be carried out, there is no time to consider the matter before action is taken, as we are told it will be, even if it be not already commenced. Although primarily it concerns the Fellows of the Royal Horticultural Society, and them only, yet the position obtained by the Society is so important that anything which concerns it finds its reflex in horticulture generally. Thanks to the zeal and energy thrown into the reconstruction of the Society, and the sound policy governing its present management, the Society is once more in a flourishing financial condition, but those conversant with its history know but too well how periods of prosperity have alternated with epochs of financial depression so severe as, on more than one occasion, to bring the Society to the verge of utter ruin. It is with the hope of avoiding any future cataclysm of this description, and with the object of improving and extending the useful work of the Society that we call attention to the proposals of the Society, in the full conviction that the Council will welcome any feasible suggestions from whatever quarter they come.

There is, of course, no question as to the progressive deterioration of the atmosphere near London. That cannot be improved by anything we can do. We are also told that the

soil at Chiswick is exhausted. That, however, is merely an affair of labour and manure. In future, culture under glass must take an even larger share of attention than it now does, and in that way, but by no means entirely, the evil consequences of the fog and smoke may be palliated.

If, however, matters have already reached the stage that Chiswick is to be definitely abandoned, it is useless to discuss matters connected with it.

It has been actually decided to purchase a trial ground at a distance from London, and to vacate Chiswick, in spite of the large expense of removing and re-erecting the houses and of the fact that unless it happens to be particularly easy of access, there will be even fewer visitors than there are now to Chiswick.

As to the trials themselves they obviously require to be carried out on a wider and more scientific basis than they have been hitherto. At present the main work done is to assess the mercantile value of certain plants, and, though not avowedly yet virtually, to allot certificates accordingly. Thus, as at the committees commercial value is the thing primarily thought of. We are far from wishing to underrate the importance of the commercial test, but we think this is only incidentally and indirectly a matter for the consideration of the society. Primarily it concerns the merchants whose trial-grounds, by the way, are on a scale of magnitude and organisation besides which the Chiswick trials look ridiculous. Moreover, the trial-grounds and propagating-houses of our great firms are, notwithstanding their commercial objects, conducted on scientific principles all but completely ignored at the Royal Horticultural Society. And so it happens, that, according to present conditions, if one wishes to see progressive and experimental horticulture carried out with a definite aim and purpose, one must visit some of the trial-grounds and experimental-houses of our great nursery and seed firms; whilst if one wishes to see which plants have obtained a First-class Certificate, now, merely a commercial advertisement, one must go to Chiswick or the Drill Hall—a strange inversion of the proprieties!

The certificates afford a means of recognising merit and interest in a particular plant, or they serve to call attention to superior cultivation. Some people we fear look upon them simply from the commercial side as lures to induce the public to buy. Consciously or unconsciously this may account for the prodigality with which they are awarded.

The relinquishment of the Chiswick garden, and the establishment of a new trial-ground elsewhere, are not the only questions which need consideration. If a proper home for the Society, affording room for the library, offices, meeting-rooms for general horticultural purposes, in fact, a horticultural institute such as we have so long yearned for, is really not attainable, a proposition the truth of which we are not inclined to admit, at least some more fitting place than the Drill Hall might be found for the fortnightly meetings. The nurserymen who avail themselves so largely of the opportunities for exhibiting their productions might be expected to come to the assistance of the Society in this matter.

The establishment of a horticultural college at the new garden is an even more serious proposal, concerning which the Council has kept the Fellows pretty much in the dark. It is rumoured that this is to be done with the active support of certain County Councils. Until we

have definite information, it would be premature to discuss this matter.

The cryptic and inadequate utterances in the annual report, or in the speech of the President, can scarcely be held to bind the Fellows to adopt without further consideration the details of such tremendous proposals. Nothing but a general statement was made at the meeting, and most of the Fellows thought that the negotiations said to be pending had reference to the celebration of the Centenary in four years time, not to any immediate action, and that there would be ample time for the consideration of details.

We allude to these matters for the sake of affording a basis for discussion. Our sole object is to secure ample consideration and free discussion of those proposals for the future, mentioned at the last annual meeting, and to ascertain what is the feeling of the Fellows at large on these most important matters.

It is not too late, even now, to call a general meeting for the purpose of eliciting further information concerning the details of schemes of such magnitude and vital importance.

All will agree in upholding any plan which will conduce to the advantage of the Society, increase its usefulness, and avert the possibility of financial disaster.

All will concur in supporting and aiding the Council and the Executive officers of the Society, who have such substantial claims on the gratitude and on the assistance of horticulturists in general.

COINCIDENT with the Paris Chrysanthemum Show announced for October 23 next, but which it seems may possibly be postponed a few days later, it has been resolved to hold an international conference, and the dates fixed are the 24th and 25th of that month.

As some of our readers are aware, there are three bodies in France that pay special attention to the Chrysanthemum, and it is probable that some little rivalry exists among them. These bodies consist of the Chrysanthemum section of the National Horticultural Society of France in Paris, the French National Chrysanthemum Society in Lyons, and the Northern French Chrysanthemum Society, whose headquarters are at Lille. They have all done good work, their publications are interesting, their members are imbued with an enthusiasm that seems to be only possessed by those flower-growers who take up the Chrysanthemum, and in each case membership is rapidly increasing. Inasmuch as the Universal Exhibition authorities have provided for a series of flower-shows during the running of this World's Fair, it was only natural to suppose that some attempt would be made to show visitors from all parts of the world something of exceptional merit in the way of a Chrysanthemum show. It is pleasing to record that this is practically settled, and that the three Societies operating in districts far apart have agreed to concentrate their efforts for this year, and all meet together in Paris in conference with other growers of Chrysanthemums. *L'union fait la force*, and we may expect something phenomenal from this triune effort.

The organising committee is at once comprehensive and representative. Many of the best names appearing, although from an English point of view we should have liked to see some Southern notabilities on the list, especially from Toulouse, that "*berceau du Chrysanthème*" where Capitaine Bernet, the first man in Europe

to raise seedling Chrysanthemums, lived, in which work he was long followed by men whose names are among the most familiar to English growers.

As at present constituted, the following is the list of the committee:—President, M. Viger; Vice-Presidents: MM. Maxime de la Roche-

presence of ladies, for a Gold Medal to be awarded, &c. Any person, French or stranger, whether a member or not of any of the three societies, can take part in the Conference, and must make application as soon as possible to the President, 84, Rue de Grenelle, Paris. Affiliated or corresponding societies may send

annually a dozen spikes, with some thirty of its handsome flowers; the variety is superb, and as an example of culture the plant is unrivalled. Since the first introduction to Europe of this remarkable plant, no other *Cypripedium* has made such a sensation as this kind. The late Prof. Dr. REICHENBACH declared that this was "one of the most astonishing introductions ever seen." The

FIG. 41.—*CYPRIPEDIUM ROTHSCILDIANUM*, IN THE COLLECTION OF BARONESS ADOLPHE DE ROTHSCILD.

(From a photograph taken by the Baroness.)

terie, Wulveryck, Calvat, Lemaire; General Secretary, M. Abel Chatenay; Secretaries: MM. Bergman, Ph. Rivoire, Cordonnier, Lionnet; Members: MM. Magne, Gab. Debrie, Delavier, Nonin, Oudot, A. Truffaut, Vacherot, L. Duval, Rozain, Boucharlat, Falzer, Dauthenay, Charmet, Combet, Muluard, Jarry, Desloges, Defraigne, and Beethune.

The regulations provide, among other things, for certain questions to be discussed, for the

two delegates, and the printed proceedings will be distributed gratis among the persons who are thus made members of the Conference.

CYPRIPEDIUM ROTHSCILDIANUM.—The specimen here illustrated (fig. 41) is in the collection of the Baroness ADOLPHE DE ROTHSCILD, of Paris, and grown in the Orchid-houses at Boulogne, near Paris. From quite a small plant purchased nine years ago we have before us a noble specimen carrying

specimen measures nearly a yard across, and carries nearly 200 leaves. Years ago we had the pleasure of admiring splendidly-grown, large specimen Orchids at our shows, and it is a loss keenly felt that now there are so few really grandly grown specimen plants; but what can excel such massive examples as here portrayed? *Cypripedium rothschildianum* bears probably the palm among lady slippers, not even *C. caudatum*, *C. Stonei*, *C. Morganiae*, and the almost priceless *C. Stonei* platytanum can compare with it. The culture of

Orchids is now better understood than ever. There are grown to-day more Orchids than have ever been in cultivation, but shall we ever see again the grand specimens of older times? Nothing should stimulate the energy and intelligence of the cultivator as growing a plant into a specimen, and up to its very maximum of development. Twenty magnificently-grown specimen Orchids give more real pleasure to a lover of plants than houses full of ordinary plants, such as may be seen anywhere. Our illustration has been taken from a photograph by the Baroness ADOLPHE DE ROTHSCHILD, whose photographic work is so well known. It is one of the most successful plant portraits we have seen.

LINNEAN SOCIETY.—February 15, 1900, Mr. C. B. CLARKE, F.R.S., Vice-President, in the chair. Mr. R. MORTON MIDDLETON, F.L.S., exhibited a series of specimens of *Asplenium Bradleyi*, Eaton, one of the rarer rock Ferns from Tennessee, to show its extreme variability. The simplest fronds exhibited were found in a damp, cold, perpendicular rift, which no sunshine could enter, at an elevation of about 1700 feet; these fronds had the simple pinnate structure, with green rachis and rounded toothed pinnae of *A. viride*, Hudson, but were more coriaceous than in that species. The other plants exhibited, however, showed a gradual tendency to become more and more compound, culminating in a luxuriant specimen with pinnatifid fronds 10 inches long, the green rachis becoming purple and shining in all the plants exposed to the sun's rays. Mr. J. C. SHENSTONE exhibited a collection of 700 photographs of British flowering plants, to show what could be accomplished by means of the camera in the direction of botanical illustration. He contended that photography was the only means by which the lines and masses of our flowering plants, as truly characteristic as the less subtle characters by means of which botanists group and arrange plants into orders, genera, and species, could be readily reproduced. He explained the various technical processes and apparatus necessary for successful plant photography, and alluded to the difficulties inseparable from the photography of plants in their natural habitats, &c. His remarks were illustrated by means of lantern-slides. Mr. J. B. CARRUTHERS, F.L.S., exhibited specimens and lantern-slides to illustrate the growth of the vegetable canker *Neotria ditissima* on the Cocoa-plant, and gave an account of certain experiments which he had made to destroy it without injury to the tree which it attacked.

STABLE-MANURE FOR POTATOS.—According to some experiments carried out for the Wilts County Council, a more profitable crop was obtained with the use of stable-manure, at 5s. a load, than with artificials. The stable-manure undoubtedly enabled the plants to resist the effects of the drought of the last two seasons.

FRUIT CROPS IN QUEENSLAND, 1900.—Acting upon instruction from the Queensland Under-Secretary for Agriculture, the Instructor in Fruit Culture attached to that department, has forwarded to us (under date January 15), the following interesting particulars connected with the fruit crops for the current season:—The last figures available show the following acreage and returns for the following fruits:—

Bananas	...	5284 acres	...	Produce	46,547,090 doz.
Pineapples	...	1130 "	...		462,752
Oranges	...	2272 "	...		1,527,460 "

The prospects of the present crop are as follows:—Bananas: The dry spring has somewhat retarded this crop, but recent rains have greatly improved it. Pineapples will be ready for marketing within a month; there is a good show of fruit on both rough-leaved and smooth Pines, and the recent rains will tend to improve the size, which promised to be small. Oranges are very patchy; some districts promising record crops, whilst others will be less than average. The same remarks apply to Mandarins. Passion-fruit has been a good crop, as

have also been Strawberries and Cape Gooseberries. Mangoes are only a small crop in the southern part of the colony.

BORDEAUX MIXTURE AND THE POTATO DISEASE.—According to the experiments made on behalf of the Wilts County Council, the average gain from the use of Bordeaux Mixture as a preventative of the Potato disease amounted to over £2 10s. per acre. The application is specially valuable to late varieties. Two applications are generally necessary, the first being most advantageous, whilst no benefit accrued from a third spraying.

CALCUTTA ROSE SHOW.—A Rose show in January is something of a novelty; one held at Calcutta on January 26, proved a thorough success in every respect in spite of a hailstorm which traversed almost the entire length of the Gangetic plain, and destroyed many Roses intended for exhibition. The varieties shown were mostly such as we are familiar with here. A full report of the show is given in our energetic contemporary, *Indian Gardening* of February 1.

NITRAGIN.—According to the *Report of the Agricultural Demonstrations at Calne, Wilts* (Eyre & Spottiswoode), a considerable gain has resulted on an average of three years from the employment of nitragin (bacteria obtained from the root-nodules of Leguminous plants). These bacteria absorb the nitrogen from the atmospheric air in the soil, and the result is the formation of nitrates, which are serviceable to the nutrition of the plant. It thus happens that the soil may become positively richer in nitrogen than it was before the growth of the crop.

THE CURVATURE OF ROOTS.—The fact is obvious enough, and many explanations have been given. Mr. J. B. POLLOCK, in the *Botanical Gazette* (Chicago) for January, has an excellent paper, in which he summarises what has been already published, and adds numerous details of his own experiments. The general conclusion is, that the protoplasm is sensitive to, or responds to, the influence of a stimulus—so much is universally acknowledged. The tip of the root is also known to be specially sensitive, and the effect of the stimulus whatever it may be, is transferred from the tip to the cells of the cortex. The effect of the stimulus so transmitted is to increase the tension between the cortex and the central cylinder on the convex side, and to decrease or reverse the tension on the concave side. The alterations in tension on the concave side are due to the circumstance that the protoplasm becomes more permeable to water, some of which exudes, and is taken up by the cells on the convex side, which thus ultimately contain more water than those of the concave side. In brief, the stimulus induces a greater flow of water to the cells of one side than to those on the other—hence the curvature.

"JACK AND JILL'S JOURNEY: A TOUR THROUGH THE PLANT KINGDOM."—This is the title of a book by PHOEBE ALLEN, and published by WELLS, GARDNER & CO. It is intended to tempt children to take notice of plants, and to learn the lessons they teach. We think such attempts are well intentioned but rarely successful, the children recognise both the powder and the jam, and while they do not like either, they specially object to the mixture of both. At least, that is our experience. We are bound in justice to add that in this case the powder is of good quality, which is not always the case in books of this character. The information, so far as it goes, is accurate. The book is appropriately illustrated, and has a sufficient index.

GERMAN DENDROLOGY.—We have before us the *Mitteilungen der Deutschen Dendrologischen Gesellschaft*, or Transactions of the German Dendrological Society, for 1899. It opens with a coloured figure and description of *Berberis Thunbergi*, by Baron von St. PAUL. This species is remarkable for the rich purple coloration of the leaves in autumn. Herr BEISSNER contributes a

useful paper on the exotic trees suitable for forests, and the decoration of wooded tracts. Herr PURPUS calls attention to certain novelties, such as *Ribes Spethianum* of Kühne; *Crataegus intricata* of Lange; *Euonymus caryophylla* of Miquel; *Celtis Davidiana* of Carrière, &c. Dr. KÜHNE contributes an elaborate paper on the occurrence of papillae and stomata on the upper surface of the leaves of certain trees. M. USTËRI has a paper on the *Berberis* and its allies. *B. stenophylla* is regarded as a true species, and not a hybrid. The publication is full of varied and interesting matter.

SPRING AT KEW.—Already there are signs of the beginning of a new year, florally speaking. Snowdrops abound, Crocuses are putting in an appearance, and the gorgeously-coloured Irises, such as *I. reticulata* and its allies, are in full bloom. Some flowering shrubs, such as *Cornus mas*, are in full bloom, and the very beautiful *Prunus triloba* is not far behind. *Eranthis cilicica* is in full bloom; it resembles the common Winter Aconite, but the flowers are rather larger, of a different shade of yellow, and the involucre is cut up into much narrower segments; in the young state these are sometimes of a brown colour, and form a kind of frilled collar around the unopened flower.

PLANTING IN THE CAPE COLONY.—The Forestry Department is undertaking the planting of Conifers for timber. At present a quarter of a million is annually paid for imported wood, mostly coniferous.

KEW AT THE PARIS EXHIBITION.—The director of the Royal Gardens has sent to the Paris Exhibition, a series of large-sized photographs illustrative of the Royal Gardens, Kew. They have been taken by Messrs. STUART & GUNN, of Richmond, and are representative of the various houses, museums, laboratory, herbarium, library, &c. The views of the lake and of the Rhododendron valley are not only representations, but lovely pictures of the scenes.

LAMBETH PALACE GROUNDS.—The Archbishop of Canterbury has consented to hand over to the London County Council a large portion of the grounds attached to Lambeth Palace to be used as a public open space. The Parks Committee of the Council have had interviews with the Primate as to how they proposed to deal with the field adjoining the Palace should they be allowed to undertake the management of it for the public benefit. It was explained at the interviews that the desire of the committee was to be enabled, with the permission and during the pleasure of the Archbishop, to undertake to lay out the ground for cricket and other games, to provide a gymnasium for children, and a playing-ground to which only women and children should have access. The proposition was that, by so treating the land, and by providing a sufficient staff to control and regulate the use of it, it would be practicable to keep the field open to the free use of the public all day. The Archbishop received these proposals with evident pleasure. The Parks Committee state that, by the generous action of the Archbishop, a playing-ground about 10 acres in area will be added to London's open spaces without cost to the county beyond what may be necessary for preparing and controlling the ground.

"ANNE PRATT'S FLOWERING PLANTS."—The new edition, edited and revised by Mr. STEY, has just been completed. The plates will be very serviceable to students of British botany. The work is published by FREDERICK WARNE & Co.

SOLDIERS' WIDOW AND ORPHAN FUND.—The "Geo. MONRO" entertainment committee, composed of the staff of Mr. GEO. MONRO, the Covent Garden fruit-salesman, and agent for the English Grape Growers' Association, gave a very successful smoking concert in the grand hall of the "Freemasons' Tavern" on Thursday, February 22, which was extremely well attended. Mr. GEO. MONRO

occupied the chair, with Mr. GEO. TIFFEN in the vice-chair, and he was supported by Messrs. A. J. and E. G. MONRO, and Mr. GEO. MONRO, jun., Mr. EDWARD ROCHFORD, Mr. ASSBEE (superintendent of Covent Garden Market), and many others well known in the trade. The programme was a long, varied, and attractive one, and encores were, so far as possible, avoided. Half of the profits of the concert will be handed over to the "Daily Telegraph Soldiers' Widows' and Orphans' Fund," and a collection in the room for the same object, after an eloquent appeal by the chairman, realised the handsome sum of £27 5s.

FRUIT FROM THE ANTIPODES.—We have received from the Manager of Inland Traffic of the Orient R.M. Steamship Co. the list of sailings

local artistes. Mr. T. CAIRNS occupied the Chair, and read an interesting and appropriate address by Mr. S. ARNOTT, Carsethorn, who was to have presided, but was prevented from attending by illness.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—We are requested to announce that the annual general meeting of members of this society will take place at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday, March 12, at 8 P.M. Mr. S. T. WRIGHT, of the Royal Horticultural Society's Gardens, Chiswick, will preside.

A SPRING SHOW, we are told, will be held on April 10 and 11, under the auspices of the Royal Botanical Society of Manchester.

the business transacted at the recent meeting, will be published in the forthcoming *Journal*, which may be expected in May. A committee has been appointed to arrange a dinner of old and present Kewites, which will be held in London this spring.

THE ANCIENT SOCIETY OF YORK FLORISTS is a vigorous horticultural institution in the big northern county, that we are glad to see by the committee's annual report just to hand, is in a very satisfactory condition. Its membership is now about 750, and larger than at any previous period of its existence. There is also a balance on the right side shown in the accounts. The society has decided to hold four minor exhibitions in the coming season, in addition to the large Chrysanthemum show which will take place on November 14, 15, and 16. The

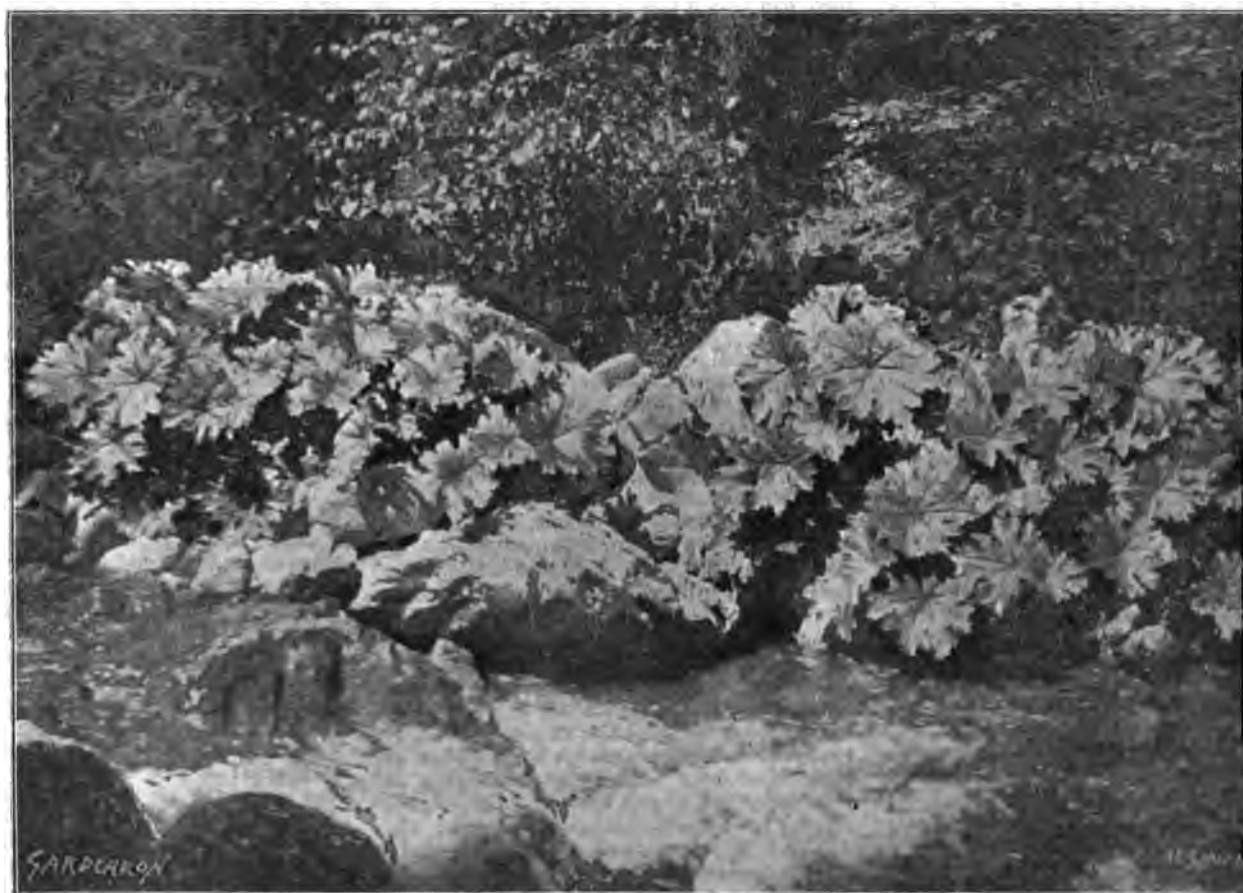

FIG. 42.—*SAXIFRAGA PELTATA* AT HOME BY THE SIDES OF A STREAM IN HUMBOLDT COUNTY, N. CALIFORNIA. (SEE P. 140.)

(From a photograph taken by Mr. J. Burtt Davy.)

of fruit ships for the ensuing season. From this it appears that the *Oroya* sailed from Sydney, N.S.W., on February 17, and is due at Tilbury with the first fruit cargo on the 31st inst. This will be followed by the *Ophir* on March 3, the *Oruba* on March 17, the *Ormuz* on March 31, the *Omrah* on April 14, and the *Cuzco* on April 28. The dates of arrival here are in order as follows: April 14, April 28, May 12, May 28, and June 11. As in former years, the number of vessels employed may be increased according to cargo demands.

DUMFRIES GARDENERS' REUNION.—The gardeners of the neighbourhood of Dumfries held their annual reunion on Friday night, when there was a good attendance. Tea was served by a competent staff of ladies, and later in the evening an enjoyable programme of music was submitted by a number of

THE KEW GUILD.—The annual meeting of the past and present "Kewites" was held in the garden library, Royal Gardens, Kew, on February 22, and in the much-regretted absence of Mr. GEO. NICHOLSON, President of the Guild, the chair was taken by Mr. W. BOTTING HEMSLEY, F.R.S. The feeling of sympathy that exists between horticulturists who have had the good fortune to acquire part of their education at Kew, finds expression at these guild meetings. A greater number of old Kewites were present on this than on any previous occasion, and an uncommonly lively interest was manifested by them in settling matters connected with the management of the guild. Members who now live long distances from Kew will be glad to know that the guild is a flourishing institution, and it should attract the active interest of all who are entitled to membership. Information of the financial state of the guild, and of

dates of the minor shows are April 18, May 23, July 18, and September 5. At the Chrysanthemum show, the prizes to be offered are as usual very liberal. For a group of Chrysanthemums, with foliage plants interspersed, a sum of £36 15s. is put aside; and for a group of Chrysanthemums exclusively, prizes are offered to the value of £23 2s. Exhibits of fruit have usually made a feature at these shows, and prizes are again offered in such classes. The secretary is Mr. G. F. W. OMAN, 38, Petergate, York.

PRESENTATION TO A SCOTCH GARDENER.—On the occasion of the marriage of Mr. W. H. WAITE, foreman of the herbaceous department, Royal Botanic Garden, Edinburgh, the garden staff presented him with a marble timepiece and a silver cruet, in token of their esteem. Mr. RICHARDSON, head gardener, in the presence of the staff, made

the presentation, adding a few remarks expressive of their sentiments. Mr. WAITE suitably replied, thanking them for their kindness.

MR. W. H. LEES, of Trent Park Gardens, New Barnet, of Chrysanthemum fame, is about to set up in business as a fruiterer and florist at Watford. He will have the best wishes of a numerous circle of friends in this new undertaking.

PUBLICATIONS RECEIVED.—*Plantes de Serre*, par MM. G. Bellair and L. Saint-Léger. (Paris: Octave Doin, 8, Place de l'Odéon, and Librairie Agricole de la Maison Rustique, 28, Rue Jacob). This book will be noticed again in our columns, and at greater length.—*Missouri Botanical Garden, Eleventh Annual Report*; this includes valuable papers on:—A Disease of *Taxodium distichum*, and a similar disease of *Libocedrus decurrens*, by H. Von Schrenk; *Agave expatriata* and other *Agaves* flowering in the Washington Botanic Garden in 1898, by J. N. Rose; A Revision of the American species of *Euphorbia* of the section *Tithymalus* occurring North of Mexico, with numerous plates; and Revision of the species of *Lophotocarpus* of the United States, and Description of a new species of *Sagittaria*, by J. G. Smith. There are many and excellent plates.—*Report of the Calne Agricultural Demonstrations*, from the Wilts County Council Agricultural Committee, 1899, Appendix D; Crops: Section I., Quemerford Station; Section II., Lickhill Station. (Beyre & Spottiswoode, East Harding Street, Fetter Lane, E.C.)—*Transactions of the Royal Scottish Arboricultural Society*, vol. xvi., part 1; this contains, among other matter, an appreciative notice and a portrait of the late Mr. Malcolm Dunn. (Edinburgh: Douglas & Foulis, Castle Street).—From the New Zealand Department of Agriculture: Reports, 1898-99, of the Division of Biology and Pomology, and Seventh Annual Report of the Department of Agriculture, 1892.—*Directions for Surveying and Arranging Home and School Grounds*, by Warren H. Manning (Boston, Mass.). A useful brochure, with many illustrative sketches.—*A Handbook for Planning and Planting Small Home Grounds*, by Warren H. Manning (Published by Stout Manual Training School, Menomonie, Wis., 1899). The title explains the scope of this little book, which includes a "list of native and commonly-cultivated plants that are represented in the collection upon the Stout Manual Training School Grounds."—*Tijdschrift voor Tuinbouw*, vijfde Jaargang, zevende en achte aflevering.

SAXIFRAGA PELTATA.

FOR the margins of streams, or for the bog garden, there are few plants more effective than this. The rockery at the Royal Gardens, Kew, affords ample illustration of the fact. The plant is of robust habit, and has a thick fleshy root-stock, from which the leaves spring. These are long-stalked, peltate, orbicular, palmately-lobed, and often as much as a foot across. The purple flowers are, it is said, arranged in clusters, which appear before the leaves. Our illustration (fig. 42, p. 139) is reproduced from a photograph taken by Mr. Burt Davy, from some plants growing in their native country. The leaf-stalks and flower-scapes are said to be used as articles of food by the Indians; see *Botanical Magazine*, t. 6074; and *Flora of California*, i., p. 193.

HARDY TERRESTRIAL ORCHIDS.

IN response to a request from one of our readers, who desires information upon the cultivation of hardy terrestrial Orchids from the pen of an expert, we reproduce some notes that were published in our columns on May 4, 1872, respecting the treatment given to the unique collection that then belonged to H.R.H. the Comte de Paris, at York House, Twickenham. The specimens that in those days were frequently shown at South Kensington by H.R.H.'s gardener, Mr. Needle, have never been excelled; and no collection, so far as we know, has been grown with greater success. On the same date that the notes were published, we gave a faithful illustration of a pot of *Ophrys tenthredinifera* shown from that collection, and which contained five very strong spikes of flowers.

The following notes refer chiefly to the cultivation of the species in pots, but it is possible to form a very interesting collection by obtaining the bulbs of various species, and planting them in positions where they may obtain conditions of soil and moisture similar to those which exist in their natural habitats. We shall be pleased if some of our correspondents who have had

experience in the cultivation of species of hardy terrestrial Orchids in the open, under more or less natural conditions, will give the results of their observations, in order to help those of our readers anxious to treat these plants successfully.

"First, then, it may be advisable to mention one or two points of interest in relation to their propagation, or we ought rather to say retention, for propagate, in the sense of multiplying, they will not, except in one or two solitary but well-marked instances. To get a stock of any particular sort, the tubers must be collected; these tubers may be divided into two classes, round and fusiform, the former belonging for the most part to the genus *Ophrys*, and the latter to the genus *Orchis*. They both produce and mature the flowering tubers the season before, so that they may be had in flower every spring. This fact is worthy the more attention, as it is a well known fact that in their native habitats they flower one year, and take a rest of one or two years after flowering, occupying the interval by forming new tubers. Mr. Needle can account for this phenomenon in no other way than that it is due to "collectors" securing all the larger tubers in favourable seasons. Certain it is that the plants under his charge flower every spring, a fresh tuber being formed the summer before, and which becomes thoroughly ripe when the old one, having played its part—that is, flowered—decomposes in much the same way as Potatoes "sets." Mr. Needle's experience leads him to believe that but very few of them make more than one bulb, but he finds that *Ophrys bombyliflora* will frequently make two.

"It should be understood by every one who intends growing these plants, (1) that their greatest enemies are heat and water, either of which applied in excess is fatal to their well doing; and (2) that they will not stand forcing or retarding, but must be allowed to come along and flower in their own due season. The plants which flowered early this spring are now going to rest, and Mr. Needle will keep them in their present quarters—an open frame facing the south—and gradually withhold water until the plants are dried off. This treatment is followed only in the case of those with round tubers, as the *Ophrys*, which will dry off. The fusiform-rooted species must always be kept moist, but not necessarily wet. When the plants are sufficiently dried off, which will readily be seen by the decaying foliage, they will be removed to a cool, shady frame under a north wall, no sun being allowed to reach them, where they will remain dry and at rest until they show signs of starting into growth again in the autumn. They will then be turned out, and be fresh potted in good turfy loam, mixed with a little leaf-mould and sand or road-scrappings. The pots must be thoroughly well drained, and the soil must be of an open porous nature, or success will not follow. These conditions are so important in themselves, that it does not seem to matter much what the compost is, so long as they are secured. After the plants are fresh potted, they will be left in the same frame until they have made a moderate growth, and will then be removed to the frame they now occupy, and which is provided with one row of piping, which is, however, only used for keeping out frost and dispelling damp. Here they will finish their growth, water being applied to them in the most careful manner, and they will be removed to the conservatory or any other cool-house to flower. As regards the best-sized pots to grow them in, Mr. Needle finds from experience that they do considerably the best when grown five tubers in a 48 (5-inch) pot; the tubers (like cuttings) coming much stronger when situated near the sides of the pots. Grown singly in small pots the roots seldom appear to increase in size. As before observed, the bulbs of the *Orchis* section will not stand drying off, but they may be treated in the same way as the *Ophrys*, with that exception.

For general cultivation, Mr. Needle recommends the following:—*Ophrys tenthredinifera*, the

strongest grower of all; *O. lutea*, *O. speculum*, *O. apifera*, and its variety, *mutilex*; *O. apiculata*, *O. fuscus*, *O. mammosa*, *O. Ferrum equinum*, *O. atrata*, *O. arachnites*, and *O. aranifera* var. *specularia*; *Orchis morio*, and its several varieties; *O. laxiflora*, *O. mascula*, *O. maculata*, *O. papilionacea*, *O. quadripunctata*, *O. longicruris*, &c. This list may, of course, be added to, according to the inclination of the grower, for extent and variety.

NATURAL GROWTH OF TERRESTRIAL ORCHIDS.

"The exact nature of the Orchid tuber is rather complicated, nor can it be said that botanists are wholly of one mind concerning it. The life history, however, is the point that mostly concerns cultivators, on which account we give here a very condensed account of the mode of growth of the tubers of *Orchis* (*Himantoglossum*) *hircinum*. The species just named, says Fabre, consists of three forms or stages—(1) the flowering stage, in which the stem develops a spike of flowers, whose function it is to propagate the species by seeds; (2) the propagative stage, in which the stem produces no flowers, but only leaves, in the lowermost axils of which are developed tubers, in this stage the multiplication of the plant by tubers is provided for; (3), the dispersal stage, in which the end of the stem becomes distended into a tuber, while the lateral buds perish. The object of this is to prevent the accumulation of tubers in any one spot, by facilitating what may be called a process of migration. It is probable that the seedling *Orchis* acquires this latter form only, in the first instance, and produces terminal tubers for some years without flowering. Then circumstances alter, and flowering-shoots are produced. It is hence not until after several flowerless shoots have been produced that flowers and seeds are formed. It will be seen from this that terrestrial Orchids undergo, under natural circumstances a series of alternations of generations.

In the second stage, the propagation by means of lateral tubers, may go on, under certain circumstances, for years, without the flowering-stage being reached. These facts supply the explanation of a fact that often puzzles collectors—the great abundance of Orchids in a given locality in one season as compared with their rarity in the same spot another year. Many years ago, a gentleman who was a keen and accurate observer, communicated to the Editor of this Journal a fact relating to the Bee-Orchid, which may in a measure be explained by the peculiarities of growth just mentioned:—"For forty years a certain field was under the plough. After this it was laid down for grass; and the third year after it was thus laid down there appeared in it at least 100 Bee-Orchises—more, in fact, than existed [query, in one spot of equal size?] in a circuit of 5 miles round." M. T. M.

NURSERY NOTES.

MESSRS. J. CARTER AND CO.

THAT the Chinese Primrose may be very successfully cultivated in strictly urban districts, is strikingly illustrated at the present time by a collection of plants in bloom in the Forest Hill Nurseries of Messrs. Carter & Co., High Holborn. It must be understood, however, that these plants are not merely grown to produce a display of bloom. The blooming period is but an incident, albeit an essential one, in the cultivation of the plants for the production of ripe, saleable seeds. This being the prime object, details of cultivation are so arranged as to encourage plants of a type best suited to the purpose. It is a fact that young plants in 5-inch or less-sized pots, will yield better, fuller seeds, than such older and larger plants in 6-inch, and even 7-inch pots, that many gardeners find useful for conservatory decoration. Accordingly, the seeds are sown comparatively late in the previous season, with the result that most of the plants begin

to show strong flower-spikes in January, whilst still in 4 or 5-inch pots. Such are the plants now in bloom at Forest Hill. There are several thousands of them, and the perfection to which the plants have been cultivated in a situation so near to London, remembering that they make nearly the whole of their growth during the winter months, is such as to excite surprise.

We were interested to know what it had been found possible to do with that curious *Primula*, the "Bouquet," described in our pages February 12, 1898, p. 106. This was an uncommonly strong-growing plant, that produced flowers with foliaceous calices, and in other other respects was very distinct. It produces so few seeds, however, when fertilised with its own pollen, that the type will probably never be offered for distribution.

pollination has been effected. Among single flowered varieties with pink or blush coloured flowers, there are *Imogene*, of very free habit, rather small blooms, and fern like foliage; *Rose Queen*, which has too little colour to justify its name, but is nevertheless an excellent variety; and *Princess May*, a giant form, with large flowers of much substance, and the most attractive of the three mentioned. Of whites there are *Elaine*, *Elaine Improved*, and *Holborn Queen*. The first-named variety may be obtained with plain or fern-like foliage, but *Elaine Improved* with plain foliage only. *Elaine Improved*, however, has larger flowers, and the plants are dwarfier. *Queen* is the most attractive, being a pretty fern-leaved variety, that bears profuse and bold flowers. But instead of remaining pure white, they assume a

the Chinese *Primrose*, and are not so perfectly double as to render them impossible of propagation by seed. One of the earliest of these to bloom is a white one known as *Snowflake*. *Aurora* has very pale salmon-pink tinted blooms. *Princess of Wales* is nearly white, but occasionally flaked with rose; *Prince of Wales* produces rose-coloured flowers, with prettily crimped margins. Vivid and double scarlet are high coloured varieties, the former possessing a shade of carmine. *Lilac Queen*, as its name would imply, has lilac-tinted blooms, and is distinct from all others.

HOME CORRESPONDENCE.

WINTER-FLOWERING CARNATION.—I send a few blooms of *Carnation William Robinson*, a variety which I think is not quite so well known as its good qualities justify. When the blooms are large, this variety is inclined to burst its calyx; but where glass accommodation is restricted and buttonholes are in demand, no scarlet-flowered variety can surpass it in the winter. By growing on a few two-year-old plants in 7 or 8-inch pots, and stopping the shoots twice during the early part of the season, viz., May and July, flowers of fair quality are obtainable in October. As the cold weather advances, small batches of plants may be introduced into stove temperature at different intervals, and a succession of bloom kept up for several months. Plants so treated ought to be transferred to the rubbish-heap when flowering is finished, being useless for propagating uses. One-year-old plants come into flower later than older ones, which helps considerably to prolong the flowering season; but if the young plants are wanted for growing on, they must not be exposed to high temperatures. *J. Minty, Riverdene, Cookham.* [The blooms are nicely double, and of a bright scarlet colour, not differing so far as we can distinguish from others of that tint. Ed.]

AFFORDING WATER TO PLANTS.—The question raised in the *Gardeners' Chronicle* at p. 80 with regard to temperature of water afforded plants is a very interesting one! I have made many experiments, and have also had discussions with others, and I believe most of those who have watched results will be in favour of using cold water in preference to warm. Of course, this requires a little qualification. I should not think of syringing with very cold water in the stove. And although there are many plants which may be watered with water barely above freezing-point, it does not follow that all subjects may be so treated; yet to come to the main issue I should be in favour of the water being rather below than above the temperature of the house, for I have had many instances of warm water being detrimental to plants. The earliest I remember was in regard to *Mignonette*. In this instance there was no other difference in treatment of temperature except that one portion was afforded water that was warmed in a tank built over a boiler, and the other was quite cold. The result was that the latter was short and sturdy, while, where warm water was used, it was much weaker, and did not come into flower so soon. I have also found that for the propagating-house it is better to have the water rather below than above the temperature of the house. Among those who have confirmed my opinion in this, I may mention the late Mr. Bause, who was one of the most successful plant raisers of his time. It is, however, inadvisable to go to either extreme, especially with regard to tender stove-plants, by using water too cold, and more so in regard to using warm water for any subjects requiring cool treatment. Rain-water is undoubtedly better than spring-water, particularly in chalky districts, though not so important in root watering. Forsyring it is most important, for in the case of Palms and other foliage plants which have to be frequently syringed, the chalky deposit not only disfigures the plants, but it stops the pores and prevents the natural absorption of moisture which is so essential to the health of subjects which derive more benefit from atmospheric rather than root-action. *A. Hemsley.*

TEA ROSES ON THEIR OWN ROOTS.—After trying to grow Roses of all kinds and in all ways for more than half a century, I have come to the

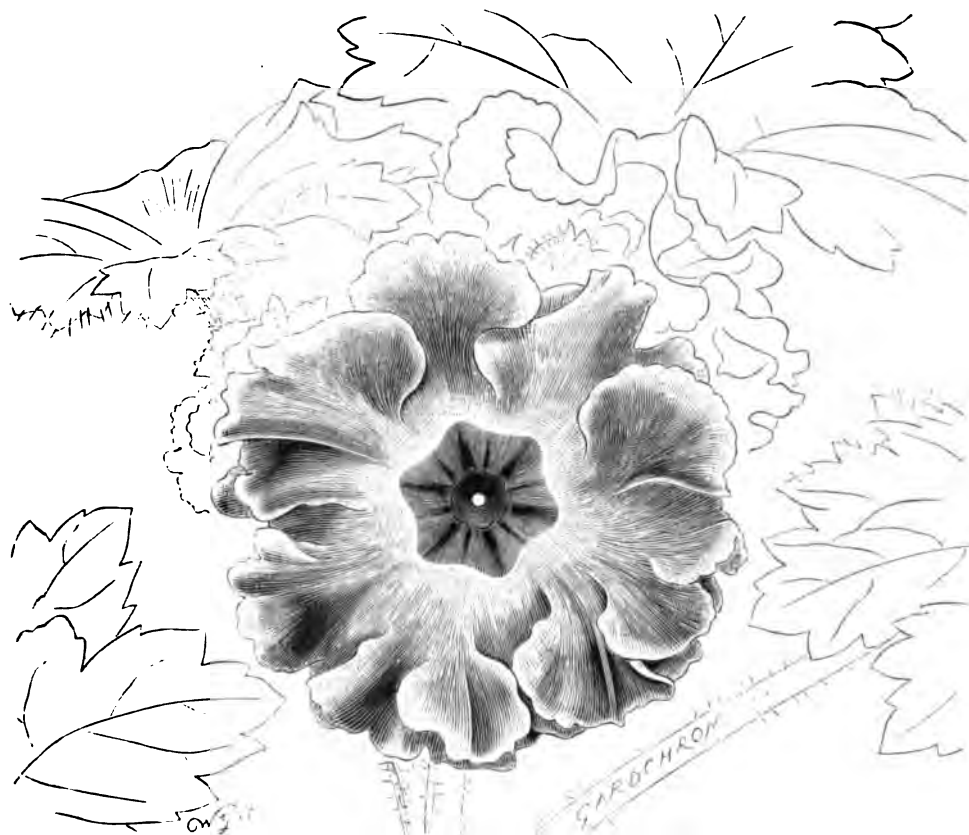

FIG. 43.—*PRIMULA SINENSIS*: A NEW VARIETY, AT MESSRS. CARTER'S NURSERY.
(Colour of flowers bright rose, with a white band around yellow eye.)

In conjunction with another parent, the "Bouquet" has been used to good effect. Several exceedingly fine giant but perfectly normal varieties have flowered from this cross, that, in general attractiveness are superior to all others in Messrs. Carter's collection. One of these was pure white with yellow eye, another mauve coloured, and the most superb of all is reproduced in fig. 43, from a photograph taken by Mr. Bard, who has the management of these nurseries. This variety has flowers of a clear bright rose colour; the eye is yellow, and around this is a white band which casts a silvery halo over the adjacent rose colour. All of these varieties have large flowers of perfect form, and the petals are wavy and fimbriated to a remarkable degree. But these novelties have to be "fixed," and for a few seasons hence.

THE NAMED VARIETIES

are those that will be available for distribution. These are in large batches, and may be readily compared or contrasted one with the other, but the colours of the flowers begin to wane directly their

blush tint after being open a short time. *Hercules* has rich mauve-coloured, prettily fimbriated flowers, and a yellowish-green eye. We noticed no yellow flowered strain. *Holborn Blue* is a very pretty variety, as nearly blue as any *Primulas* have yet been seen. When first open the flowers have a pretty effect, owing to there being a dark purple band round the yellow eye. Of brighter coloured varieties, we were most attracted by one called *New Scarlet*. It has effective flowers of very rich red colour; it is not yet ready for distribution, but is likely soon to supersede the variety at present known as *Scarlet*. *Ruby* is much later to bloom than *Scarlet*, and is now producing a grand lot of flowers; it is very rich in colour, and has fern-like foliage, this characteristic being the principal difference between this variety and one known as *Carmine*. *Vermilion* represents the deepest of the bright-coloured varieties. Among several other single-flowered varieties may be mentioned *Venus*; the flowers are mostly white, but few are pure, owing to splashes or flakings of red.

The semi-doubles represent a useful section of

conclusion that in the very unfavourable conditions of cold and wet soil, and damp, sunless atmosphere, which my garden presents, I must be satisfied with poor results. Advice given on the spot from many very successful growers has frequently been acted upon, though often contrary and inconsistent, and I do not write to ask for more. Dwarf-worked Tea Roses are planted by the hundred, and after struggling in a mutilated form through two or three mild winters, are killed to the base by a winter like this, and the following summer presents little more, in their place, than a forest of Dog Rose suckers. Why do I not grow the Roses on their own roots? I always regret, when too late, that I have not taken a quantity of cuttings. So I shall have to buy the plants: but where? I look through the catalogues of some dozen prominent nurserymen, and cannot find one which offers by the hundred Tea Roses on their own roots. I am told they do not pay; and of course one would expect to pay more for them than for worked Roses. But even at an advanced price, they do not seem to be in the market. *C. Wolley Dod, Edge Hall, Malpas.*

QUINCES IN SUSSEX.—Before this subject is dropped, the following remarks may not be unwelcome to many readers of the *Gardeners' Chronicle*. In old garden literature, two distinct forms of Quinces are commonly noted, the one the "Pomme de Coin" of the French, the other, the "Poire de Coin." The Belgians called the first-named "Queappel," the last "Queeeren." Markham called the former the male, or Quince Apple; the latter the female, or "Quineese." Lord Bacon again writes of Quincies and Melocotones; by the first of these referring to the Pear-shaped variety, and by the other to the Apple-shaped Quince. Quince is, of course, identical with the French Coing, Chanier's "Coyne," and the old English Quoyne, being exactly the same with the old French "Coin." I think it is Des Serres that says "Melocotone" as a name is derived from the skin of the fruit being *Cotonné*, hence the name would mean the "Woolly Apple." Leo Grindon considered the Quince the representative of the Golden Apple of mythology, and the "tapaesch" of Scripture. He quotes an interesting letter sent by Henry VIII. to one of his subjects, who had presented her sovereign with some "cotinate," in which she is requested to send some more "as soon as may be." The making of marmalade as well as other methods of preserving the Quince is exhaustively treated in the *English Housewife*, no less than twelve ways of treating the fruit being explained in that early work. There were two sorts of marmalade, the one red, the other white; the first-named being secured by the simple method of keeping a cover on the vessel while the preserve was cooking. *B.*

HARDY FRUITS IN HEDGEROWS.—I think this subject should be more ventilated in the horticultural press than it is, for there are many places in the country districts which might, with a trifling expense, be made beautiful and profitable if fruit trees of suitable kinds and varieties were planted in our hedgerows and road boundaries. The subject has been talked and written about frequently, but hitherto little good has resulted, many saying what would be the good of it, for the produce would be taken by anyone who chose to do so. It is my opinion that if the planting was general throughout the length and breadth of the land, there would be abundance and to spare. Moreover, fruit trees in hedgerows would be claimed by the owner or farm-tenant, and under the same protection by law as the other farm produce. I would prefer to see the hedges dividing the various fields on a farm selected as the sites for the trees, rather than those bordering public roads. Fruit trees succeed when planted in the line of old hedgerows if large holes are excavated and fresh loamy soil employed in the filling, and most of this could be obtained from field banks. Only tall standard trees with strong straight stems are suitable for this kind of planting, and protection against game, sheep, and other farm stock must be afforded; the trees must also be secured to stout stakes with tarred string, in a way that does not injure the bark, and the whole length of stem enclosed in strong rabbit-proof wire netting, which should be put into the ground 6 inches. As a protection against farm-stock, iron guards should be fixed until the trees have acquired age. In new hedges the trees should not be planted too

thickly, say 40 to 50 yards apart, according to the direction of the line of hedge with an eye to the views across country. It is now many years ago, that by desire of Lord Middleton I planted several hundreds of fruit trees in the hedged lanes of what is called the Home Farm at this place, and many of these trees have grown into capital specimens, and carry good crops of fruit, when otherwise there would have been only hedgerows. Keswick Codling, Ecklinville, Blenheim Orange Pippin, and other strong-growing varieties have done particularly well, Ecklinville especially so. Some hardy varieties of Pears and Plums were planted. I know of no more beautiful sight in the country than a fruit-tree covered with blossoms, or an Apple-tree loaded with its ruddy fruits. *Bailey Wadds, Birdsall, York.*

SOCIETIES.

ROYAL HORTICULTURAL.

FEBRUARY 27.—The display on the occasion of the meeting of the Committees of this Society on Tuesday last, was a better one than has yet been made this year. The weather having become exceptionally mild, opportunity was given Orchid cultivators to exhibit their novelties, and this being the first occasion for some time when it has been safe to show other than cut blooms, the opportunity was taken advantage of largely. Orchids were the best feature of the show, and the report below describes a considerable number of novelties that were staged.

The Floral Committee had before it a large collection of plants of Cyclamen, from Messrs. H. CANNELL & SONS; a magnificent display of Camellias in pots from Messrs. Wm. PAUL & SON, Waltham Cross, Herts, to which the Society's Gold Medal was awarded; several groups of miscellaneous plants and small exhibits, from the hardy plant nurserymen, of Irises, Narcissus, Cyclamens, and other very early flowering plants, most of them being shown in pots. Novelties that gained Awards were *Primula x kewensis*, *Iris stenophylla*, *Camellia General Hector Macdonald*, and the old *Agapetes buxifolia*.

The Fruit and Vegetable Committee recommended an Award of Merit to Apple "Cabalva," an old local Welsh variety, sent by Mr. PERRIGRAW, Cardiff Castle Gardens. Very well-fruited growths of *Vanilla planifolia* were shown from the Duke of NORTHUMBERLAND's garden; and ripe Papaw fruits from the gardens of LEOPOLD DE ROTHSCHILD, Esq. It rained during the whole of the day, and it was difficult to see the exhibits in the Drill Hall, owing to the poor light.

Floral Committee.

Present: W. Marshall (Chairman), and Messrs. C. T. Drury, Owen Thomas, H. B. May, Geo. Nicholson, G. Reuther, R. Dean, W. Howe, J. Hudson, J. Jennings, R. Fife, R. B. Lowe, C. J. Salter, Ch. E. Pearson, J. W. Barr, Chas. Jeffries, J. Fraser, Geo. Gordon, W. H. Lees, Jas. Walker, Chas. E. Shea, H. J. Cutbush, E. H. Jenkins, H. J. Jones, E. T. Cook, and Geo. Paul.

Messrs. Wm. CUTBUSH & SON, Highgate, London, N., in a group of miscellaneous plants, showed some capital specimens of *Ericas* in full flower. These included *E. melanthra*, *E. Wilmoreana*; *Epacris Lady Penmore*, white and pink; and *E. Diadem*, deep red; *Boronia megastigma* was shown well. *Daphne indicis rubra*, *Acacia Drummondii*, the most useful of *Acacias* for cultivation in small pots. A few small plants of *Forsythia suspensa* were in bloom, and there was a nice mass of *Iris reticulata* purpurea, and *Primula denticulata* alba. *Citrus sinensis* in several plants carried a nice crop of Oranges; and there were a few foliage plants used to relieve the flowering species already named (Silver Banksian Medal).

Messrs. JOHN PEED & SONS, Roupell Park Nurseries, Norwood Road, London, S.E., showed a group of nice lanceous plants (Bronze Flora Medal).

Four of the newer varieties of Violets were shown by bunches of blooms from Her Majesty The QUEEN's garden at Osborne, I. W. (gr., Mr. G. Noble). These were *Princess Beatrice*, *Primavera*, *Amiral Avellan*, and *Princess of Wales*, several of which have been illustrated in the *Gardeners' Chronicle* (Vote of Thanks).

Cyclamens were shown splendidly on this occasion by Messrs. H. CANNELL & SONS, Swanley, Kent. The exhibit included one hundred plants, a 1 of which were growing in 5-inch pots, and they were remarkable from the points either of cultivation, or of excellence in strain. The foliage was vigorous, of moderate size, and the habit of the plants compact. All of them were profusely bloomed, and the substance and brilliancy of the flowers, and the stout character of the stems showed plainly that they had been brought on gradually under the best cultural conditions. Of colours were noticed deep crimson, salmon-mauve, pale blush, white, and white with purple base, pink, and other varieties, including a nice batch of the "Papilio" section now becoming very popular (Silver-gilt Banksian Medal).

Really fine specimen *Cyclamens* were shown from the gardens of the Earl of JENSEN, Osterley Park, Middlesex (gr., Mr. J. Hawkes). There were two plants two years old, and they have not been reported since the plants bloomed twelve months ago; both of them were white varieties, and one of them carried as many as 140 blooms. These being shown late, were not placed before the committee.

Mr. GEO. MOUNT, of Canterbury, has again commenced contributions of Rose blooms to these meetings, and had upon this occasion about sixty very nice blooms. The varieties Mrs. John Laing, Captain Hayward, and La France, were those shown.

Messrs. F. SANDER & CO., St. Albans, showed a tiny plant of a new Azalea, from a cross between *A. Deutsche Perle* and *A. Miss E. Jarrett*; the flowers are pure white, very large, with pretty wavy margins to each petal.

Messrs. PAUL & SON, Cheshunt, showed blooms of a pretty white-flowering Lilac, named *Belle de Nancy*, and of Paul's Single White Rose, a very charming garden or Pillar Rose.

Lachenalia Nelsoni, the exceedingly pretty yellow-flowered species, was shown in excellent manner from the gardens of Lord SUFFIELD, Guntton Park, Norwich (gr., Mr. Allan). There were more than a dozen pots, magnificently furnished, and in addition some cut sprays of blooms (Silver Banksian Medal).

A very large group of *Narcissi* in pots was shown by PURNELL PURNELL, Esq., Woodlands, Streatham Hill. The Trumpet, Incomparabilis, Leodis, and Poeticus sections were all represented by numerous varieties (Silver Flora Medal).

Mr. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, showed a group of bulbous plants flowering in pots, including a selection of varieties of *Hyacinths*. A few *Narcissus*, including *N. Telamonius plenus*, *obvallaris*, *rugibosus*, *Henry Irving*, &c., were similarly shown, and cut flowers of other *Narcissus*. This is the first exhibit of the kind made by Mr. JONES, who last year only commenced a trade in bulbs (Silver Banksian Medal).

Messrs. T. S. WARE, Ltd., Hale Farm Nurseries, Tottenham, showed a few hardy plants in pots, including *Leucojum carpatium* and *Galanthus nivalis* Whittall, a new large-flowering Snowdrop, respecting which a note appeared on p. 80. The pretty little Saxifraga *Bursieriana* was shown in flower. The new *Kranthis cilicica*, *Hyacinthus aureus*, several of the hardy *Cyclamens*, including white, rose, and purple-flowered varieties of *C. Atkinsii*.

Messrs. WALLACE & CO., Colchester, showed a small collection of very interesting hardy plants in flower, *Iris reticulata*, *I. r. major*, *I. r. Krelagei* (purple), and *I. Danfordiae*, &c. Also *Galanthus Fosteri robustus*, and *G. nivalis* Whittall, *Anemone blanda*, &c.

Messrs. BARR & SONS, King Street, Covent Garden, had a group of hardy plants in flower in pots. In the centre was a large clump of a white variety of *Iris unguiculata*. There were also *Narcissus minimus*, *N. cyclamineus*, &c., *Galanthus Ikarie*, hardy *Cyclamens*, species of *Crocus*, *Chionodoxa*, *Primula obconica grandiflora*, &c., and *Hellebores*.

Some well cultivated plants of varieties of the Chinese *Primula* were shown by Col. HERAY PLATT, Gorrindog, Llanfairfechan, and a Cultural Commendation was awarded them.

Messrs. JAS. VAITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, again made a pretty show with blooms of varieties of their hybrid greenhouse *Rhododendrons*.

Messrs. W. PAUL & SON, Nurserymen, Waltham Cross, exhibited a group of *Camellias* arranged on the floor, measuring 20 yards in length and 3 in width, forming a sloping bank. The plants were excellently flowered, as we are now accustomed to see them in this annual display, their flowering season by no means at an end, numerous flowers being visible on all the plants. The group was set off by a line of *Clematis indivisa lobata* arranged along the front, the flowers of which afforded a marked contrast to those of the *Camellias*. Among varieties of the latter, *C. Lady Ardilaun*, having a white flower resembling an *Anemone*, was noted. As shown, it seemed to be scarcely an acquisition, but it may improve as the plant ages. Most of the old favourites were well shown, either as cut blooms or as plants. We noted *Chandleri*, *Mathotiana*, *Marchioness of Exeter*, *alba plena*, *Lady Hume's Blush*, *Monteroni*, *Teutonia*, *Boadicea*, &c. (Gold Medal).

Awards.

Agapetes buxifolia.—A very old *Vacciniaceae* shrub, suitable for cultivation in a warm greenhouse. It is hard-wooded, has small oval oblong, thick, bright green leaves, and tubular flowers, an inch or more long, and bright red in colour, produced in corymba. A well-flowered plant was shown by Mr. J. T. BENNETT-FOX, Holmewood, Cheshunt, gr., Mr. Downes (Award of Merit).

Camellia General Hector Macdonald.—A very fine new semi-double *Camellia*, flowers 5 inches across, and of a pleasing soft shade of rose colour. From Messrs. F. SANDER & CO., St. Albans (Award of Merit).

Iris stenophylla.—A new bulbous species, shown by Messrs. WALLACE & CO., Colchester, who obtained bulbs from Mr. Siehe, of Messina. The flowers were about 6 inches high, and of exceptionally pleasing colour. A fuller description and illustration will be given in our next issue (First-class Certificate).

Primula x Kewensis.—This is an accidental hybrid between *P. floribunda* and *P. verticillata*, and has originated in the Conservatory, Royal Gardens, Kew. It is fairly intermediate between its parents, and will make an excellent garden plant. The hybrid is fully described on p. 130 under "New Noteworthy Plants" (First-class Certificate).

Orchid Committee.

Present: J. Gurney Fowler, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), W. Cobb, J. Douglas, H. A. Tracy, H. T. Pitt, W. Thompson, E. Hill, J. Jacques, T. W. Bond, F. J. Thorne, J. W. Potter, J. T. Gabriel, H. J. Chapman, W. H. Young, H. Little, H. Ballantine, De B. Crawshaw, C. J. Lucas, R. B. White, J. Colman, and T. B. Haywood.

There was a very fine display of Orchids, Dendrobiums, as usual at this season, predominating.

Sir Trevor Lawrence, Bart., Burford (gr., Mr. W. H. White), staged a very fine group, containing well-flowered examples of many of the Burford hybrids. Specially fine were *Dendrobium* × *Clio* and *D. × Clio* Burford variety, showing the two extremes of colour and shape, the former being a narrow-petalled light form, and the latter a large round, rose-tinted flower, with rich orange-coloured disc. Also fine were *D. × Burfordiense*, *D. × melanodiscus* in variety, *D. × Schneiderianum*, *D. × speciosum-Kingianum*, *D. × The Pearl*, *D. × splendidum grandiflorum*, *D. × Juno*, *D. × Luna*, *D. × pallens*, *D. × Wiganie xanthochilum*, and other hybrids, all heavily laden with flowers. Of the species were the rare *D. Jerdonianum*, the little white *D. herbaceum*, the rose and purple *D. Treacherianum*, and a fine example of the white *D. barbatulum*. At one end of the arrangement was a nice group of *Phalenopsis Schilleriana*, and *P. Stuartiana*, and one example of *P. × intermedia Portei*; and among other subjects noted were a fine panful of several varieties of *Cypripedium* × *hirsuto-Sallieri*, *C. × Lebaudyum*, *C. × Alice*, *C. × argo-Morganie*, *C. × Rothschildianum superbiens*, *C. × Chamberlaini-insigne*; *Calanthe × gigas*, and a totally new and distinct hybrid, *C. × Ariadne*; the singular *S. African Habeneria Bonata*; *Masdevallia × Curlei*, *M. × Glaphyantha*, *M. Schroderiana*, *Bulbophyllum Cayanum*, &c. (A Silver-gilt Flora Medal was awarded for the group).

H. T. Pitt, Esq., Roselys, Stamford Hill, was awarded a Silver-gilt Flora Medal for a very fine group of rare and remarkably well-flowered Orchids, the centre plant of the group being a magnificent plant of *Cymbidium × eburneo-Lowianum*, with seven stout spikes of fully expanded flowers, and two in bud (Cultural Commendation). Noteworthy among a great variety of good things were *Miltonia × Bleuana*; a very fine set of varieties of hybrid *Odontoglossum* of the *O. × Andersonianum* class; the elegant *O. nevium* with three spikes, *O. cordatum*, four spikes; good *O. crispum*, *O. cirrosum*, *O. luteo-purpureum*, &c. *Epidendrum Wallisii*, *Cypripedium × Lathamianum*, *C. × nitens*, and others; *Lælia cinnabarina*, *L. harpophylla*, *Dendrobium atroviolaceum*, and other Dendrobiums, &c.

Messrs. Jas. Veitch & Sons, Chelsea, were awarded a Silver Flora Medal for a very fine group, in which were two examples of *Lælio-Cattleya × callistoglossa splendens*, of very rich colour; *L. × Myra splendens*, yellow, with purple lip; *L. × Antimachus* (*L. × Dominiana × C. Warscewiczii*), resembling a light-coloured *L. × eximia*; *Odontoglossum × crispum-triumphans*; *Cypripedium × Abas* (*villosum* ♂ *Stonesi* ♀). Several forms of *Lælia × Mrs. Gratrix*, varying from clear light yellow to yellow, tinted with rose; *Phalenopsis × Mrs. J. H. Veitch*, and *P. × Ariadne* (*Aphrodite* × *Stuartiana*); *Sophrone-Lælia × lacta superba*; *Phaius-Calanthæ × Niobe*, *Epidendrum × elegantulum*, *E. × O'Brienianum*, *E. radicans*, *Lælia glauca*, and many *Cypripediums* and Dendrobiums.

WELBORN E. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Darrell), staged a very effective group of *Odontoglossums*, all finely grown and well-flowered (Silver Banksian Medal).

W. THOMPSON, Esq., Walton Grange, Stone (gr., Mr. W. Stevens), showed a small group of very fine *Odontoglossums*, including *O. × excellens nobiliss*, *O. × excellens spectabile*, the fine *O. × Wilkeanum concinnum*, *O. crispum*, "Yellow Gem," *O. × Loochristiense Kimberley*, a fine yellow flower, blotched and shaded with brown; and several very handsome and distinct forms of *O. × Adriane*.

Mr. JAS. CYPHER, Cheltenham, was awarded a Silver Banksian Medal for a good group of Dendrobiums, grown and flowered in his usual good style. Among them were a fine well-rounded form of *Dendrobium × Cybele*, *D. × splendidissimum*, Thompson's variety; *D. × s.*, Lee's variety; *D. × Almsworthi*, Cypher's variety; *D. × A. Leechianum*, *D. × Ethel* (*Rolfes roseum × moniliforme*), *D. nobile Cooksoni*, *D. crassinode album*, and other varieties; good *Sophrone* grandiflora, *Cypripedium villosum grandiflorum*, *C. insigne* Standard, *Miltonia Rozeii*, &c.

J. LEEHMAN, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), exhibited cut flowers of the pure white *Dendrobium nobile virginale*, Leemann's variety.

Baron Schroder, The Dell, Mgham (gr., Mr. H. Ballantine), showed *Lælia Jongheana*.

R. I. MEASURES, Esq., Camberwell (gr., Mr. H. J. Chapman), showed *Cypripedium villosum superbum* and *Restrepia striata*, with flowers of R. Falkenbergi and R. antennifera.

A. H. SMER, Esq., Hackbridge (gr., Mr. Humphreys), showed cut examples of *Cattleya Trianaei* Leena, C. T. Backhouseiana, C. T. Penelope, and a plant of the singular little *Lanum Berkleyi*.

Messrs. CHARLESWORTH & Co., Heaton, Bradford, showed *Epi-Lælia × Heatonensis* (*Lælia cinnabarina × E. Wallisii*). The plant was small, and bore one flower shaped like E. Wallisii. Sepals and petals Indian red, with a few purple spots on the petals. Lip whitish with purple markings at the base.

T. B. HAYWOOD, Esq., Woodhatch, Reigate (gr., Mr. C. J. Sutter), showed a grand plant of *Dendrobium × splendidissimum grandiflorum*, with seven long pseudo-bulbs furnished with

flowers (Cultural Commendation); and *Dendrobium × Virgil* (nobile roseum × *Answorthi*), a charming, nearly white flower with dark centre.

Messrs. F. SANDER & Co., St. Albans, showed a number of pretty plants of *Epidendrum × orphanum*, with white flowers variously tinted and spotted with violet, after the manner of *E. × Andresio-Wallisii*; also a fine specimen of the scarlet *Ephronitis × Veitchi*, *Lælia Jongheana*, and *Selenipedium × Titanum* (*longifolium Hilsenianum × Lindlayanum*), a very strong grower; and good hybrid *Phaius*.

De B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Lælia anceps Dawsoni rosefieldensis*, a white variety of *L. a. Dawsoni* form, but with pale pink tip to the labellum; also *Lælia Jongheana*.

S. G. LUTWICH, Esq., Beckenham, showed *Cypripedium × Beechense*, and a seedling *Dendrobium*.

Messrs. B. S. WILLIAMS & Son, Holloway, staged a good group, in which were *Cypripedium Boxalli nigrum*, *C. callosum*, *C. × discolor*, *C. × euryandrum*, *C. × Harrisianum superbum*, *C. × Lebaudyum*, *C. × Measuresianum*, *C. × cananthum superbum*, *C. × Pitcherianum*, Williams' variety; *C. × Wianianum*, *C. villosum*, *Dendrobium × Burfordiense*, *Cymbidium eburnum*, *Platyclinis glumacea valida*, &c.

The Right Honble. Lord Rothschild (gr., Mr. E. Hill), sent a singular *Schomburgkia*, with pretty flowers, with narrow undulate segments of a purplish-red colour, the lip centre purple, resembling a form of *S. undulata*.

Messrs. HUGH LOW & Co., Bush Hill Park, staged a group, in the centre of which was a magnificent example of *Cattleya Trianaei alba*, with thirty flowers; and with it *Odontoglossum crispum* Cronje, a handsome white flower, finely blotched with small chocolate spots; *O. a. Lord Kitchener*, a handsome rose tinted flower with large brown blotches. *O. c. luteolum*, pale yellow. *Cattleya Trianaei Titania*, a charming light form, *C. T. intensa*, *Cypripedium × Chas. Richman*, &c.

LT.-COL. SHIPWAY, Grove House, Chiswick (gr., Mr. Walters), showed *Cattleya Trianaei alba*, and a very fine dark form of *Cymbidium Tracyanum*.

J. S. MOSS, Esq., Wintershill, Bishops Waltham, showed a spike of the fine white *Cologyle Mossii*, and *Cattleya Trianaei*.

Awards.

FIRST CLASS CERTIFICATE.

Lælia × Edisa (anceps ♀ *purpurea* ♂), from Messrs. JAS. VEITCH & Sons, a charming hybrid with flowers, somewhat of the form of *L. anceps*, but much larger. Sepals and petals pale lilac; front of lip rich purple.

AWARD OF MERIT.

Cattleya Trianaei, West Bank House var., from J. LEEHMAN, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge). A very handsome and singular variety, bearing some resemblance in growth and flower to *C. Warscewiczii*. Flowers large and of firm substance. Sepals and petals bright rose coloured; base of lip purple with white lines; broad middle area glowing orange colour, the finely expanded front lobe bright purplish-crimson, with a flambred light rose margin.

Zygopetalum Balli, Holbe.—From G. S. BALL, Esq., Wilmslow (gr., Mr. Gibbon). A very fine flower with the form of *Z. rostratum*. Sepals white, tinged with rose-purple; petals rose-purple, with freckling of white showing through the blotches on the outer halves; lip white with purple blotches around the callus.

Odontoglossum × Loochristiense Kimberley.—From W. THOMPSON, Esq., Walton Grange (gr., Mr. W. Stevens). The best of its class. Flowers large, yellow, spotted with red-brown, and slightly tinged with rose on the reverse side.

Odontoglossum × Adriane Lord Roberts, from W. THOMPSON, Esq., Walton Grange. A handsome variety, with cream-white flowers, spotted with purplish-brown.

BOTANICAL CERTIFICATE.

Dendrobium Jerdonianum, from Sir Trevor Lawrence, Bart. (gr., Mr. W. H. White). A highland Indian species, forming a pretty bush-like plant, and bearing orange-coloured flowers.

Dendrobium punctum, from Sir Trevor Lawrence, Bart. Flowers in dense clusters; pale pink.

Restrepia striata, from R. I. MEASURES, Esq., Camberwell (gr., Mr. H. J. Chapman). Flowers yellow, closely marked with dotted lines of reddish-brown.

Fruit and Vegetable Committee.

Present: Phillip Crowley, Esq. (Chairman); and Messrs. Jas. H. Veitch, W. Wilks, E. Shaw Blaker, W. Poupert, M. Gleeson, Geo. Kelf, Alex. Dean, S. Mortimer, G. T. Miles, W. Bates, Geo. Reynolds, Geo. Wythes, H. Balderson, F. Q. Lane, J. Willard, E. Beckett, H. Markham, and Geo. Bunyard.

A commendable collection of Apples was shown by C. P. SERCOLO, Esq., Taplow Hill, Maidenhead (gr., Mr. R. Bullock). There were rather more than a score of varieties, some of which were of remarkable freshness and quality for present date of season. Mention may be made of Cox's Orange Pippin, Blenheim Orange, Waltham Abbey Seedling, Fearn's Pippin, Claygate Pearmain, and Herefordshire Pearmain. The rather rough-looking but distinct-flavoured Braddon Pippin was included in the exhibit, and the dishes were hidden partially with highly-coloured Berberis foliage (Silver Banksian Medal).

Several varieties of Pears were shown, including Josephine de Malines, Bergamotte d'Espere, and Duchesse de Bordeaux, all of them from Mr. J. C. GILBERT, Anemone Nurseries, Dyke Bourne, Lincolnshire. Mr. GILBERT also

showed Apples Barnack Beauty, a great favourite in Kent; and Bramley's Seedling.

From the DUKE OF NORTHUMBERLAND's garden, Syon House, Brentford (gr., Mr. G. Wythes), were shown freely fruited growths of *Vanilla planifolia*. Similar growths have been illustrated in our pages, April 8, 1899, p. 213.

Excellent specimens of "Tender-and-True" Parsnips from Lord ALDENHAM's garden, Aldenham House, Elstree, drew a Cultural Commendation from the Committee. The roots were exceptionally even, smooth, and pale in colour.

Mr. JOHN CROOK, Forie Abbey Gardens, Chard, showed six dishes of Apples, representing the varieties Cox's Orange Pippin, Scarlet Nonpareil, Dumelow's Seedling, Sturmer Pippin, Ribston Pippin, and Loddington Pippin.

Ripe fruits of the common Papaw (*Carica Papaya*), were shown from the gardens of LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton. They were tasted by the Committee, but their flavour was not greatly appreciated. However, a cultural commendation was deservedly given in respect to them.

Award.

Apple "Cabalva."—A fruit of medium or large size, of similar form to that of Blenheim Orange. Deep red upon one side, yellow on the other, and marked upon pale side with numerous dark brown spots. Stem inserted in a very deep and wide basin. Eye apparently closed, set in a ribbed basin also rather deep. It may be of good quality as a late dessert fruit, and certainly will be useful for the kitchen. The fruits, said Mr. A. PERRIGREW, of Cardiff Castle Gardens, who sent them to the Drill Hall, are from a very old tree. It is probably an old local Welsh Apple that deserves to be brought to the front (Award of Merit).

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 22.—The meeting on the above date was a very successful one, and a magnificent lot of Orchids was exhibited.

G. SHORLAND BALL, Esq., Wilmslow (gr., Mr. Gibbon), sent his beautiful and rare *Zygopetalum Balli*, which was awarded a First-class Certificate last year; also a very good form of *Lælia Jongheana*, which seems to grow well at Wilmslow (Award of Merit).

W. THOMPSON, Esq., Stone (gr., Mr. Stevens), staged a charming group of *Odontoglossums*, excellent in every way, models of good culture, and of such beautiful forms as to satisfy the most fastidious amateur. One of the most distinct was *O. crispum*, var. "Duke of York," a medium-sized form, with incurving segments, densely covered throughout with crimson markings (First-class Certificate). *O. crispum* "The Sirdar" is another beautiful form of quite a distinct type; a medium-sized flower, with an almost entire band of colour drawn around the centre of the flower (Award of Merit). *Odontoglossum asperum grandiflorum*, though perhaps of not such great monetary value as some of the preceding plants, is undoubtedly one of the most handsome and remarkable *Odontoglossums* ever seen; polished mahogany would probably describe its sepals and petals, with here and there a touch of yellow; this plant bearing as it did some sixteen flowers formed a picture not soon forgotten, the plant gained a well-merited First-class Certificate. Other fine plants in this group were *O. crispum* "Madonna," Award of Merit; *O. c.* "Yellow Gem," First-class Certificate; *O. × Wilkeanum* var. *concinnum*, Award of Merit; *O. × excellens* var. *McBeaniana*, Award of Merit; *O. Adriane* var. *Lady Roberts*, Award of Merit; *O. × Loochristiense* "Kimberley," one of the hybrids raised at Stone, and whose flowers expanded on the memorable day on which we received news of Kimberley's relief. A Gold Medal was awarded to Mr. Thompson's group.

T. STATTER, Esq., Whitefield (gr., Mr. Johnson), showed a pretty little *Dendrobium* hybrid between *D. Findlayanum × D. Cassiope*, also the brilliant *Cypripedium Statterianum*.

J. LEEHMAN, Esq., Heaton Mersey (gr., Mr. Edge), staged a fine group, which received a Silver-gilt Medal. Amongst the plants chosen for the inspection of the committee was the lovely *Lælio-Cattleya Bertha Fournier* var. *splendida*, a fine thing between *L. elegans* and *C. aurea*; this plant is one of the most brilliant of the hybrids yet raised, and reflects much credit on the selection of the raiser, M. Maron (the plant received a First-class Certificate unanimously).

Mr. LEEHMAN received Awards of Merit for the following plants:—*Cattleya Trianaei*, "West Bank House" var., C. T. var. *Empress*, C. D. var. *Enfieldensis*, *Lælia anceps* var. *Leemannii*, a very fine form; *Cypripedium × Vipan*, and *C. Rothschildianum × Curtisii*.

S. GRATRIX, Esq., Whalley Range (gr., Mr. McLeod), gained Awards of Merit for *Cattleya Trianaei* "General French," an elegant form, which was greatly admired; for *Cypripedium × Cowleyanum* var. *magnificum*, and for *C. × J. Howes*.

D. B. RAFFART, Esq., Liscard, Cheshire (gr., Mr. Nicholson), received an Award of Merit for *Cattleya Trianaei* var. *Backhouseana*; the markings on the petals of this variety are extraordinary, and lend much character to the flower; they almost represent a small labellum of *Cattleya Trianaei* "Ironed" out. Is this true *Backhouseana*? The same gentleman showed *Cypripedium × Harrisianum* var. *vircescens* (Award of Merit).

T. BAXTER, Esq., Morecambe (gr., Mr. Roberts), received Awards of Merit for *Odontoglossum crispum*, var. *Lady Roberts*, a fine variety with a grand spike of blooms; while the same award was given to a superb form of *O. × Andersonianum* called *Oakfield* var., and which deserves to rank amongst the best forms of this plant.

W. BOLTON, Esq., Wilderspool, Warrington (gr., Mr. Cain), sent a brace of *Cattleya Trianaei*.

R. ASHWORTH, Esq., Ashlands, Newchurch (gr., Mr. PIDSLEY), exhibited a well-grown plant of the pure white *Dendrobium nobile* var. *virginialis*, and received a First-class Certificate. Other plants from the same collection were a fair form of *L. C. × callistoglossa*, and *Odontoglossums Humeanum* and *asperum*.

Mr. J. CYPHER, Cheltenham, exhibited a very nice group of Orchids, which was awarded a Silver Medal, and among which was a very good plant and variety of the old favourite hybrid, *Cypripedium × Morganiae*.

Mr. J. ROBSON, Altrincham, received an Award of Merit for a handsome form of *Cypripedium × Niobe*.

Mr. A. J. KEELING showed *Cypripedium × Courtauldianum*. P. W.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 20.—A meeting of the Executive Committee was held at Carr's Restaurant, Strand, on the above date, Mr. P. Waterer in the Chair.

The main business was the reception of reports from various Committees, that from the Floral Committee was to the effect that a Schedule of points had been drawn up by which new Chrysanthemums would be judged in the future; a maximum of eighteen points representing the ideal standard flower; and the points are divided into form, represented by breadth and depth, colour, size, solidity, and finish; any flower obtaining fifteen points and upwards will be awarded a First-class Certificate of Merit; any obtaining from twelve points up to fifteen, an Award of Merit; and any obtaining from nine up to twelve, a Commendation. In like manner decorative and market varieties had twelve points allotted to them for habit, freedom of bloom, adaptability for cutting, &c. A Schedule will be filled up in the case of any good flower, showing the estimate formed of it by the Committee according to the number of points awarded. The Classification Committee recommended the preparation and publication of a supplemental catalogue during the coming summer, and it was referred to that Committee to prepare the same, with Mr. C. H. Payne as editor. The Schedule Revision brought up their report, showing the alterations and additions made in the Schedule of Prizes; with the sum of £17 odd added. The Group Class has been increased in size, and the President, Sir Edwin Saunders, gives a first prize of £15. Some new members were elected; and the King's Lynn, and Halifax Chrysanthemum Societies were admitted to affiliation.

MISCELLANEOUS SOCIETIES:

Bristol and District Gardeners Mutual Improvement Association.—The fortnightly meeting was held at St. John's Parish Room on Thursday, 22nd ult.; Mr. Chas. Lock presiding over a good attendance of members. The paper for the evening was furnished by Mr. A. Moore-Sara, of Elmalds, Stoke Bishop, on "The pollen-grain and its functions." With the help of a blackboard he made the subject very interesting, tracing the varied notions as to the sexuality of flowers, from the time of Herodotus down to the 17th century; when in 1676 Dr. Grew, in a book on *Plant Anatomy*, laid down in definite terms the law of vegetative impregnation, accepted by botanists to-day, and in a greater or lesser degree understood by all present day gardeners. Dealing in detail with the subject, he described the formation of the pollen, some of the many methods of distribution, and the processes through which it had to pass until fertilisation was complete. A short discussion followed, chiefly on the advisability of forming a Botany Class in connection with the Association.

Reading Gardeners' Mutual Improvement.—"Horticultural Buildings" was the subject of a paper read before the members of the above Association on the 26th ult., by Mr. G. H. Parsons, horticultural builder, Reading; who said that horticultural buildings are quite modern as compared with religious and domestic buildings. Their necessity arose from the bringing home of plants and seeds that would not stand the rigours of our climate. To prolong the season of fruit, flowers, and vegetables, is also another reason for construction. After explaining the action of the rays of light passing through glass at various angles, Mr. Parsons passed on to the consideration of glass and roof angles, sites, forms of houses, heating, staging, pathways, brickwork, timber, ironwork, glass and glazing, painting, &c.

ANSWERS TO CORRESPONDENTS.

ABNORMAL RICHARDIA ETHIOPICA SPATHES: *Thos. Thompson.* These occurrences are common, due probably to more people cultivating this plant, and to the lavish use of manures, which induces great vigour, that finds an outlet in redundant and hose-in-hose spathes.

CARNATION LEAVES WITH PARASITIC FUNGUS THEREON: *W. G. R.* The leaves are affected by the so-called Carnation Rust, *Puccinia Dianthi*. The "teliospores" germinate on the host plant as soon as they are ripe; the germinating threads penetrate the stomata of the leaves, and go through the circle of life again without any change of generation. The cultivator should therefore destroy the affected plants without loss of time by burning, or in the case of slightly affected ones, syringe them with sulphide of potassium 4-oz. to one gallon of hot water.

CYCLAMENS FAILING TO GROW: *E. A. A.* The failure of the plants is due certainly to the improper kind of soil used, which is lacking in porosity, and consists of too large a proportion of loam in relation to the other ingredients. Moreover the loam is lacking in fibre; hence its tendency to become sour. The application of manure at weekly intervals is uncalled for, and has had something to do with the failure of the plants; and lastly, the temperature at night has been too high by 5° at the least; and 70° by day is not always desirable in very dull days in winter.

"FUNGUS" ON LAWN: *W. G. J.* Not a fungus, for it is green. It is an Alga, known as *Nostoc*. It grows in damp places. If on paths, the application of salt will kill it. On a lawn rake it off, and if possible improve the drainage.

LONG-STEMMED ROSES, LA FRANCE: *W. D.* These Roses are chiefly grown at Canterbury. They are by no means difficult to obtain. It is more a question of varieties suitable for the purpose. Mrs. John Laing, General Jacqueminot, Baroness Rothschild, Madame Gabrielle Luizet, Dupuy Jamain, and others, which naturally make long growths before the flowers show themselves. There are two methods of securing such blooms—one is to plant in borders, and cultivate in the ordinary method. As soon as the flowers are over, the lights are gradually removed, and the plants ripened by early autumn, so as to admit of early winter pruning, and re-starting for another crop. These plants produce flowers in February and March. They must be early started in November, and grown on very steadily at the first. Pot-plants are also used, and can be started early or late. The great desideratum is to have thoroughly healthy and well-matured wood to commence upon. The same plants serve year after year, and when once forced and ripened early, are naturally better suited for other occasions, seeing that they have done their main growing and flowering earlier than the ordinary plants. Plants potted up from the open are not suited for such forcing the same season. There is nothing special in their culture. Suitable varieties, and no hesitation in cutting away wood when securing the blooms, are the main features. The plants flower only once.

MUSA ENSETTE: *A. R. P., Nice.* Every species of Musa, on bearing fruit, loses the stem on which the bunch of fruits was produced, its place being taken by a sucker, or young plant, which in most instances is a year or older when the bunch emerges from the crown. The plant therefore does not die, on the contrary it is perpetuated by the sucker or suckers. A root may be dug up and divided into as many pieces as there are suckers, developed or undeveloped.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*W. W.* Chiefly garden hybrids from *Azalea amena* and *A. obtusa*. They may be hardy in the south-western counties. We cannot name the varieties.—*E. F.* A good variety of *Cypripedium villosum* and *Dendrobium Findlayianum*.—*E. M. C.* 1, *Aspidium trifoliatum*; 2, *Cheilanthes elegans*.—*R. F.* *Asclepias curassavica*, and not *Euphorbia jacquiniiflora*, which is a very different and much more tender plant.—*F. C. C.* Miserable scraps, one is *Berberis stenophylla*, the other broader-leaved one is *B. Darwini*.

OPUNTIAS WITH BROWN SPOTS: *A. C.* We take these appearances to be caused by punctures made by the plants' own spines, or those of other plants. If you find that the brown spots become large and spreading, kindly send further specimens.

PELAGONIUM LEAVES WITH PUNCTURES: *X. J. R.* The punctures may be caused by some insect, which might be caught at night by the aid of a lantern. You do not afford us the least scrap of information concerning your method of cultivation, but judging from the weak, drawn cuttings sent with the note, it cannot be quite of the right sort. Cuttings taken from the plants are not likely to be of much service. Afford a more generous mode of cultivation; let the plants enjoy the utmost amount of sunshine, and of fresh air in mild weather; and do not afford an excessive quantity of water to the soil or in the

air of the house, and remember that the zonal *Pelargonium* is not a very tender plant in this country. In parts of Cornwall, and Wales, and in Southern Ireland the plant lives out of doors the whole year.

RAINFALL FOR THE SOUTH: *B. L.* The average has been for the past two years in most parts of the country, and especially in the west, below the normal. We would refer you to the observations on the weather, to be found in every issue of the *Gardeners' Chronicle*.

SHOOTS OF FRUIT TREES INTENDED TO FORM GRAFTING SCIONS: *L. A. W.* It is quite time that these shoots were taken from the trees, laying them in thin lines on a cool border where the sun cannot reach them. They should be buried to two-thirds of their length, and the soil closed firmly about them. Grafting may be done in late March, and as late as the second week in April. The right time depends on the latitude of the place, the further north the later.

"SPOT" ON GRAPES, AND SPRAYING MIXTURES: *C. H.* We would not advise the use of the Bordeaux Mixture before the berries reach the size of Sweet Pea-seeds. As a precaution you should paint the hot-water pipes and walls with lime-wash containing a pint of flowers-of-sulphur to the pailful of wash. The sulphur should, before it is added to the lime, be mixed into a thickish paste, otherwise it will float on the surface, and not be generally distributed throughout the wash. The first dressing would preferably be one of sulphide of potassium, at the rate of half oz. to 1 gallon of warm rain-water. The Bordeaux Mixture: To make the latter dissolve 6 lb. copper sulphate in 1 gallon of hot-water, in an earthenware or wooden vessel; in another vessel slake 3 lb. of fresh lime in 1 gallon of water. Strain the latter, and add 20 gallons of water. Now pour in the dissolved copper-sulphate and mix thoroughly. A safe dilute formula consists of 4 lb. of copper-sulphate, 4 lb. of fresh lime, and 50 gallons of water. This is quite effectual, and is preferable for use on tender plants under glass. No fungicide should be used after the berries are half-grown. We should imagine from what you tell us, the roots of the Vine are in a bad state, and that the soil has got into an unwholesome condition.

THE TWO METHODS OF FRUITING THE PEACH: *J. T.* The "diseased" portion of the unstopped Peach-shoot is the effect, really, of frost acting on immature wood. The spur of Peach-wood covered with bloom would be well-ripened, and not liable to this kind of injury.

TOMATO SEEDLINGS GOING OFF: *Gardener.* The result probably of the crowding of the plants in the seed-pots and too humid an atmosphere. They are much drawn. The obvious cure is to sow thinly, prick off quickly, grow the plants from the first close to the glass, afford air whenever it is safe so to do, and let the surroundings lean to the dry side.

VEGETATION FOR COVERING STEEP BANKS: *A. B. C.* You cannot have better plants for this purpose than *Saxifraga hypnoides*, *S. trifurcata*, and *S. decipiens*. The plants are of low growth, hardy, and evergreen, soon covering the soil; and providing moisture is not very deficient, spread far and wide. The best time to plant is August and September. It is necessary to remove the flower-stalk as soon as season of flowering is past, or the object for which they were planted will be lost.

Continued Increase in the Circulation of the
"GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS' AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is considered for reference in all the principal libraries.

(For Markets and Weather, see p. xiv.)

NATURE AND HORTICULTURE.

THERE is much more affinity existing between these than is likely to occur to the thoughtless mind. I am strongly of opinion that the highest efforts of gardening genius, of what may be termed horticultural intellect, have been inspired by the teachings of beneficent Nature. Even in the direction of floral arrangements, the picturesque, effective groupings of plants and flowers, and above all, of ornamental foliage or flowering trees within the ever-delightful garden domain, we have derived from Nature our noblest conceptions. We find that she is always a generous giver; that she is effusive in her vegetative and floral affluence; but though she gives us vast masses of colour, those brilliant revelations (of what can be effected in certain situations by one ineffably luminous hue), are always adequately modified by dense, shadowy masses of enviroing green. Here, then, is a memorable artistic lesson imparted to us by the Creator through the medium of his most tangible and realisable creation, for the formation of an almost ideal garden, which will charm us not less by its brightness, than soothe us by its shade. This was the garden of man's earthly paradise as pictured by Milton, who could feel intensely what he was unable to behold; and the love of peaceful, shadowy scenes, with their tranquillising umbrageousness, which is a memory of Eden, adheres to us still. The brave Champion, one of the fairest of all our woodland flowers,

which not seldom illuminates in winter the desolate waysides wherever the slightest protection from the storm can be obtained, is in summer the central glory of our Scottish glens; but its environment is always of a strongly contrasted character, dark green and purple shades predominating, to give its radiant pictures their adequate influence on the Nature-loving mind. So also with the beautiful wild Hyacinth (*Scilla nutans*), whose effect is so marvellous in the woods in fragrant May, and of which Alexander Smith, in his finest lyrical poem, has so expressively sung:—

"O, fair the lightly-sprinkled waste,
O'er which a laughing shower has raced:
O, fair the April shoots!
O, fair the woods on summer days,
When a blue hyacinthine blaze
Is dreaming round the roots!"

I sometimes think, but perhaps I am too exacting, that if the word "haze" had been instinctively substituted by this gifted singer for the term which ends the penultimate line, the passage I have quoted would have been even more expressive.

Nature does not exhibit her brightest floral possessions or most artistic creations as our great rosarians do, though there are manifest signs of a revolution in this special department of emulous activity. It is rarely that she gives us flowers without foliage, excepting perhaps among the African or Arabian desert sands. But in every region which is adequately watered by the generous rains of heaven, and on which the glorious sunlight shines; where the "parent of day" is not a veritable tyrant, seeking like a certain roaring lion recorded in Revelation, what he may devour, or at any rate, consume; in those blessed regions of profuse vegetation the fairest flowers find amid their romantic surroundings a wealth of gracious shade. In my own garden I have made every provision for this requirement, which is as requisite for our mental and physical natures as it is for the vitality (as well as the adornment through exquisite colorative contrast) of the trees and flowers. We are often recommended by professional cultivators not to plant flowers beneath trees, but I have invariably grown *Violas* in such positions with splendid results; there in the grateful shade they last for years, and blossom abundantly, while many of their number, exposed to the glaring sun, have drooped and died.

In the woods which adorn the northern region of this picturesque parish, the odorous Woodbine and many varieties of the wild Rose grow up the trees to a marvellous elevation, and form, during the period of floral fruition, exceedingly beautiful and striking effects. Such pictures I have endeavoured, not without success, to reproduce in my garden, which seems specially adapted by Nature and art to fulfil the aspirations of the noblest climbing flowers. Therein the lovely Eckford Sweet Peas, the great *Nasturtium*, *Tropæolum speciosum*, and *T. canariense* (as I have indicated in a previous article), blossom with almost tropical luxuriance on venerable trees, often at a height of 15 feet; *Linaria cymbalaria*, with its lilac and white flowers, entirely covers the northern

wall, where it has the close companionship of *Geranium Robertianum*. The other walls of the garden being festooned with *Roses* of aspiring tendencies, among which the most conspicuous are *L'Idéal*, *Madame Pierre Cochet*, *William Allen Richardson*, *Madame Alfred Carrière*, *Bouquet d'Or*, *Turner's brilliant Crimson Rambler*, *Niphetos*, and climbing *Perle des Jardins*. The Tree *Fuchsia* grows and flowers at the head of the garden, as if it breathed the atmosphere of Chili or Peru. This is a native of South America, and always is most gracious on the confines of the sea.

Among the greatest natural adornments of our gardens are the flowering trees; especially the Almond, the Apple, the snow-white Cherry, with its Hawthorn fragrance, and the double-flowering Peach. The horticultural art becomes the reverential inspiration of Nature, when we contemplate the refinement and the glory of these. *David R. Williamson.*

TWO GOOD LONG-KEEPING PEARS.

I HAVE recently seen some good late Pears noticed in the *Gardeners' Chronicle*, but no mention has been made of *Nouvelle Fulvie*, and only a line devoted to *Josephine de Malines*, two of our best winter fruits. *Nouvelle Fulvie* does not excel in all kinds of soil and localities. At Syon the soil is not just of the right sort for fruit-trees, yet this variety succeeds where others fail. Again at Teddington, the late Mr. Blackmore says, in *Hogg's Fruit Manual*, it is not a good Pear. I admit that the fruit is not of handsome form, but that is not of much consequence when its keeping and eating qualities are taken into account.

The variety was raised by M. Grégoire, of Jodoigne, in Belgium, nearly fifty years ago, so that it is not new, and I wonder that with the scarcity of late and good Pears it is not more commonly planted, as even in a light soil the fruits keep well into February. Owing to the heat and drought of the last two seasons, our Pears have not kept so long as usual. This variety is of middle size, in shape pyriform, with the skin of a dark green tint, becoming of a dull yellow hue with faint crimson markings. In sunnier countries than ours it is much more highly coloured. In shape the fruit is rather irregular, and on bushes and pyramids it has not a taking appearance; although the flavour is good, with a flesh very juicy and melting, free of grittiness. The tree is of compact growth at Syon, but in a more loamy soil it is apt to be more irregular. The variety rarely fails to bear a crop, whether as pyramid, bush, or wall-tree, and is not at all a shy bearer grown as a cordon. The fruits come large and shapely on a tree on our west and south walls. The variety does well in the Messrs. Bunyard's Allington Nursery, and with Mr. G. Woodward, Barham Court, Maidstone.

I should note that Mr. Turton, in the *Gardeners' Chronicle*, p. 29, remarked on the value of Pear *Josephine de Malines*, though he only gives its name. The variety is better known than *Nouvelle Fulvie*, and will need but few words from me. The fruit is of medium size, with a yellow rind when ripe; deliciously perfumed, very juicy, and one of the sweetest of Pears, and of rich flavour. The variety does well on the Quince, and though deserving of a place on a wall in the colder parts of the country, it is valuable as a pyramid in the southern and western counties. At Syon the tree grows somewhat straggling, but it crops well when the head is kept open; as a wall tree it bears freely even when young. The fruit is in season from January to May; the variety is a good wall Pear in the north. It was put into commerce in 1830. I cannot say that it is a success as a cordon at Syon. *G. Wythes, Syon House Gardens, Brentford.*

soil to the depth of several feet, and the intense heat and aridity of the air seared and withered up all vegetation. Both months had the highest maximum temperatures of which I have any records; that of July being only fractionally below 80°, and that of August being 81°. The diurnal range was frequently 30° to 40° for many consecutive days. In some cases deciduous trees cast their leaves in August, leaving their branches bare of all semblance of foliage, and the lawns became indistinguishable in colour from the high roads. Under such conditions all summer-flowering plants were, of course, hopelessly handicapped.

The autumn was generally favourable, but we suffered much from artificially-created fogs. The rainfall for the year was 19.98 in. The average maximum 60°; the absolute maximum being 93°, and the absolute minimum 15° (December, 1899). On forty-six days during the year the shade temperature reached 80°, which is fully twice the average number of days on which such high temperatures are annually reached.

We had one exceptional maximum shade-reading of 65° on February 11. The long protracted drought, which had lasted for two and a half years, was broken up early in November by copious rains.

I noticed during October and December that the area afflicted by artificially-made London smoke fogs had extended several miles westward. Previously I had sometimes noticed distinct yellowness in the fogs, and consequent loss of light, but never until the October of 1899 had a genuine dry smoke fog reached out so many miles. In December the same abomination was inflicted upon us again and again. During the past winter (1898-1899) no excessive frost occurred, the lowest temperature, 21°, being in March. Hence I have not to record any losses among the doubtfully hardy plants.

Among the new or rare plants which flowered with me this past year, I may mention a gigantic *Crinum* which came to me under the very good descriptive name of "*campanulatum*." [This is far removed from the *C. campanulatum* of Herbert.] It is an undescribed species allied to *C. latifolium*. *Crinum* *Wimbushii*, another species allied to *C. pauciflorum*, but more floriferous; coming from Kota Kota by Lake Nyassa. *Crinum* *Yemensis*, a good thing, and new I believe to British though not to continental gardens; this shows alliance with *C. brachynema*, and is at least as hardy as *C. Moorei*, if not quite hardy. *Hymenocallis* "*Daphne*," a splendid hybrid raised by Mr. Van Tubergen, of Haarlem. This is distinct from *H. macrostephana*, and is one of the finest forms in the whole genus. *Hymenocallis* *schizostephana*, a new species of which you have already published a description, and of which I am sending you a figure. *Hyline* *Worsleyi*, a new species in a genus hitherto considered monotypic. *Zephyrites elliptica*, a new specimen subgenerically distinct from the Mexican *Zephyranthes macrostiphon*. *Habranthus advenum*, a species common for many years in catalogues, but which appears very difficult to flower in this climate; this September a couple of bulbs flowered in the open. *Hippeastrum organense* and *H. Correiensis*, two interesting epiphytes from the Organ Mountains, highly prized in the days when Mrs. Bury compiled her *Hexandrian Plants*, but long since lost. These flowered freely. *Lycoris cyrtanthiflora*, a new species allied to *L. sanguinea*. *Calliopsyche mirabilis*, this has been known for thirty years, but is still very rare, and is new to my collection. *Brodiaea* (*Triteleia*) *aurea*, a delicately minute species, but of considerable hardiness. After being treated as a hardy plant throughout the winter, it flowered in the open in May. The foliage will withstand 17° of frost without damage.

Among those plant-monstrosities which occur from time to time, and which furnish opportunities for the perpetuation of such divergencies from the type, I may mention during the past year observing a flower of *Iris chinensis* with four falls and four standards; a flower of *Brunsvigia Josephine* with ten segments and ten stamens; and also a flower

of *Agapanthus umbellatus* with twelve segments and stamens, but apparently only one style. This latter, on being self-fertilised, however, produced two distinct fruits, from which it would appear that there must have really been two styles cohering. I have cultivated *Agapanthus umbellatus* for a number of years, but have never succeeded in raising fertile seeds. The so-called seedling forms common on the Continent seem to be seedlings of another species of *Agapanthus*, being hardy, and much dwarfer, and narrower in the leaf; these also seed with me. *Iris tuberosa* must be ranked as hardy; this April its flowers expanded in perfection after a frosty night. *Eucharis Lehmanni* has proved itself to be a "good" species, as it comes true from seed; the seedlings flowered two years from sowing. *Brodiaea* (*Triteleia*) *Sellowiana*, a new species, showing an alliance with *B. uniflora*. This is a single-flowered species of a brilliant chrome-yellow colour, and, if sufficiently hardy, will make a splendid companion for *B. uniflora*.

Among seeds raised for purposes of determination and comparison, I may mention those of *Hymenocallis speciosa*, *Acis autumnalis*, and *Lycoris cyrtanthiflora*. The seeds of this latter plant are not true to the descriptions given of *Lycoris* seeds, so that unless some mistake has arisen in past times it would seem that we have more than one genus included under *Lycoris*.

Many *Amaryllidaceae* are of great value for outside decorative effect during summer and early autumn. Among such I may mention *Crinum Moorei*, which, if given a shady position under big trees, and protected from wind, blooms in perfection and lasts far longer than under glass. Among the *Lycoris* which have been in the open ground for five years, *L. squamigera* again produced over 100 flower-scapes (averaging from five to eight flowers to the scape), and *L. cyrtanthiflora*, eight scapes. This latter species is not, however, suited for outside work, as it is not effective, and the flowers bleach in a single day. *L. aurea* and *L. radiata* both failed to flower. My *Brunsvigia*s were very disappointing last summer, not more than one in eight flowering. I cannot account for this in any way. I certainly think that *Lycoris squamigera* has proved itself to be a good garden plant, at any rate on dry soils. It flowers about the middle of August, and the flowering season lasts fully three weeks. *Amaryllis* flowers directly the *Lycoris* are over, so that a border containing both these bulbs should give nearly two months consecutive display of bloom. *A. Worsleyi*, *Mandeville House*, *Isleworth*, February, 1900.

NOTES ON SOME PHASES IN TOMATO CULTIVATION.

I VENTURE to think I need make but little apology in offering to the readers of the *Gardeners' Chronicle* a few remarks drawn from experience in the cultivation of this fruit, more especially in view of the ever increasing interest taken in its production in this country, with the laudable hope that, ere long, we shall be able to put on the market a sufficient quantity of first-class English fruit adequate to meet all demands, and thus render ourselves independent of the foreign producers, who now send us such vast quantities yearly, lacking alike good appearance, flavour, and wholesomeness.

Few, I imagine, will venture to deny that the present-day Tomato culture in England for market purposes is unsatisfactory. It seems impossible that any uniform practice can be successful if carried out in all soils and districts alike, and yet a follow-my-neighbour method is very much in evidence, which frequently leads to unsatisfactory results. Hard-and-fast rules are of very little value to any grower; and rather than adhere to these, I would advise him to study the nature of the soil and climate of his district, and by tentative experiments attempt to find the best methods by which remunerative crops can be produced.

FIELD CULTIVATION.

An interesting paper appeared in this journal on September 30 last, page 257, on this subject, followed, in subsequent numbers, by comments on the same by various writers. Doubtless such cultivation in England is highly to be desired; at the same time, I do not think writers have, as yet, quite bridged over the difficulties attending it. Would it pay? is the primary question to be asked. To this question I do not hesitate to reply—I do not think it would pay. Some of the correspondents have, I think, clearly and truly pointed out that it is of little use planting in the open other than strong plants out of 5-inch pots. I do not say that the bottom bunches of fruit should be "set," because when this is the case, I have frequently found that such fruit rarely swells to its natural size. Well, at the lowest estimate we have 7,000 plants to the acre, which, of course, entails cost of 7,000 pots, and 7,000 sticks to support the plants in the open. In addition to these drawbacks, there is the cost of the erection of house or frame room for the rearing of the young plants, and the risks attending a wet season and consequent disease. But, to my mind, the cost of labour would be by far the heaviest item of all, and under this head not a word is written by any of the correspondents, although estimates are given of probable returns. Let any advocate of field cultivation calculate the cost of labour required in the cultivation of an acre of out-door Tomatoes, which includes during six months, rearing, affording water, weeding the land, pruning, gathering and packing, tying, &c., and I will be bound to say the results will somewhat surprise him. Profits would doubtless accrue were the estimates of from 5 to 8 lb. per plant reached, but in my humble opinion the lowest figure is much too high to name as that to be obtained over a large area. Individual plants, we all know, in a garden will sometimes yield more than 8 lb. of ripe fruit, but it is a very different matter when the yield of a large area has to be taken into consideration; and I fear that in too many cases estimates are based upon the yield of these carefully cultivated garden plants. Then as to prices: I should consider a grower uncommonly lucky if he could obtain an average of 3d. per lb. for the whole produce of an acre of Tomatoes. My experience teaches me that after deducting carriage, commission, and other expenses, 1d. per lb. would be much nearer the mark.

SMALL HOLDINGS.

Instead of attempting, on any extended scale, the field cultivation of the Tomato, I would rather be inclined to advocate a system of encouragement being held out to cottagers and holders of allotments to cultivate the plant on a scale however individually small. If this were done, and an organised system of buying and forwarding to market established, great benefit would be derived by the populations of those counties of England best suited to the industry, and would, to a great extent, free us from the purchasing of the—in many ways—objectionable produce of foreign countries. I have written the above in the belief that it is vastly easier for the cottager to keep the few plants he grows in health, and induce them to yield a much heavier crop per plant, than it is for the big grower with his tens of thousands.

It has been said that the peasantry of France made the Suez Canal by purchasing shares with money saved from the sale of eggs and other commodities, the produce of their small holdings; and in former years—whatever it may be now—it is well known that all the tea imported into England and other countries from China was produced in the same way. No such system has its counterpart in England, although equally favourable opportunities present themselves—a state of things greatly to be deplored. Tens of thousands of cottage-gardens and small holdings now half cultivated or totally neglected in the Tomato producing counties of England might, by

the cultivation of the plant, be made to yield a revenue alike beneficial to their owners and the country at large.

BEST VARIETIES TO GROW.

I think it is almost futile to advocate any particular variety or varieties, as those well adapted to one class of soil might be worthless, or almost so, when planted on another. I will only add on this head that the much despised "Old Red" is none the worse, on most soils, for being despised. Its appearance may not be liked on the tables of the wealthy, but its "setting" qualities, rich colour, and fine flavour do not suffer on that account, provided always that a good "strain" be cultivated. Each grower, however, must find out for himself by experience which variety best suits his conditions of soil and climate.

FLAVOUR IN TOMATOS.

Notwithstanding all that has been said and written regarding the relative flavour in the different varieties, I do not know if any great difference would exist were they all grown under similar conditions. That various conditions of

ZYGOPETALUM BALLI,

ROLFE, N. SP.

OUR illustration (fig. 47) represents a flower of a remarkable *Zygopetalum*, shown by G. Shorland Ball, Esq., Ashford, Wilmslow (gr., Mr. Gibbon), under the above name, at the meeting of the Royal Horticultural Society, February 27, when it was voted an Award of Merit. No information was given about the plant, and only a single flower was shown; it is, therefore, only possible to guess at the habit of the plant, which is probably of the *Z. rostratum* section. The ground colour of the flower is white, the greater part of the surface of the sepals being tinged with rose-purple. The inner portions of the petals and the area of the lip surrounding the callus are blotched with bright rose-purple. It is a very showy and distinct flower.

RAISING ALPINE PLANTS FROM SEEDS.

THIS subject, which Mr. H. Correvon has introduced in the *Gardeners' Chronicle*, p. 84, is one full of interest to growers of these plants.

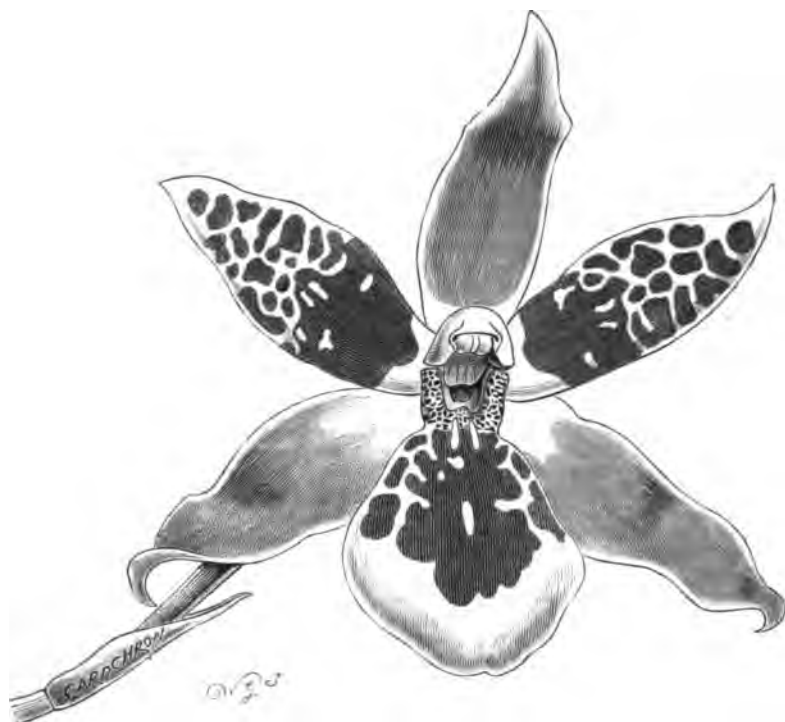

FIG. 47.—*ZYGOPETALUM BALLI*.

culture affects the flavour in the fruit, there can be little doubt; and at least two of the most potent factors in ruining the flavour of the Tomato are the excessive use of unpurified, and for that matter purified manure, and the barbarous habit of denuding the plant to a great extent of its foliage during all stages of its growth. The finest flavoured Tomatos I ever tasted were from stray plants growing by the side of a jungle-path in India. The seeds had, by some means, evidently found their way from some planter's garden, and germinated during the rainy season, but the plants at the time of my gathering the fruits had been without any moisture save dew for two months at least. The fruits were small, but the flavour was superb.

I have often wondered under what conditions of soil the Tomato is found in a wild state. Can it be that its habitat is gritty or stony ground, or rocky mountain slopes? Its long, almost fibreless roots seem, in England, to ramble with delight in rubble of any kind. *J. Lowrie*.

(To be continued.)

Unfortunately for would-be growers in lowland gardens, the information concerning the sowings of fresh seeds, and the results obtained therefrom, do not hold out much greater hope of success than we have experienced in the past. There is just this difficulty of "fresh seeds," i.e., quite new ones, and the knowledge that you really possess them. Particularly would genuinely fresh seeds be highly valued by present-day growers of alpine plants. The rarer species of *Androsaces* for example, which are not only difficult to collect in good condition for transplanting, but much more difficult to get through to their intended destination in a satisfactory condition. Faults of packing, length of time in transit, and delay between the uprooting and ultimate despatch, all play a part in rendering difficulties even more difficult still. Some of these delays may be inevitable, while others certainly might be modified; and it is in these circumstances that good seeds of many alpinists would prove a great boon to many cultivators.

The alpine Pinks, the dwarfed tufted species,

as, for instance, *D. neglectus*, are so desirable that yard-wide patches on the rockery would be welcome; yet such masses are never seen in gardens. Seed of these Pinks, in common with many members of the *Caryophyllæ*, lose none of their fertility by being kept for a year under cool uniform conditions, even in ordinary paper packets; and it is to be deplored that good vegetative seeds are not forthcoming in greater quantity, particularly as the plants, the older tufts especially, do not lend themselves kindly to digging up and transplantation. Some failures of plants to grow are the direct outcome of sending the plants late in the year, when there is little hope of new roots being made, and of the plant becoming established. The same plants arriving in this country in August, or early in September, would have better chances of surviving. Broadly speaking, *Crucifera*, *Compositæ*, *Umbellifera*, and *Leguminosæ* plants offer but few difficulties in the matter of seeds and plant-raising from seeds, not a few of the plants seedling quite freely in British gardens. It is a different matter with *Primulas*, *Androsaces*, *Anemones*, &c., the last-named of these in not a few species or their varieties, appearing rapidly to lose their powers of germinating. This is so fully recognised in the commoner garden kinds, as *A. coronaria*, &c., that a distinct recommendation to "sow as soon as ripe," accompanies any reference to raising the plants from seeds. In the case of *A. alpina* and its sulphur form, the failures are greater than the successes, so far as raising plants from imported seeds is concerned. Home-saved seeds germinate well and freely, and each year this important fact is more recognised.

In the case of *Primulas*, I have had exceptions from the rule concerning fresh seeds. The experience was quite new to me at the time, and I had kept the seeds, which were originally of my own saving, upwards of six years, in an ordinary paper packet, but in a place where atmospheric conditions were fairly uniform. Not expecting the results that followed, I put seed into a 48-pot that would have been enough to have sown half-a-dozen pots 6 inches across. In three weeks from the time of sowing, several hundreds of young plants appeared. *Cyclamen* seed, which I kept for 11 or 12 years, I am not quite sure which, germinated in the proportion of 90 per cent. in just the usual length of time that new seeds require, viz., six weeks. On the other hand, seeds of *Anthericum*, taken from bursting capsules, and sown at once by me, did not germinate for two years, some of the same crop, sown later by some months, germinating thickly at the same time.

Snow covering for seeds is a thing usually out of the reach of those in English lowland gardens. Doubtless, such a perfectly protective covering is required by many alpinists, not merely as a covering, but as affording moisture. It is probable that the uniform degree of moisture afforded by snow, and its long continuance, assisted those *Gentians* and *Primulas* which Mr. Correvon asserts "all germinated at one time." At much lower levels, and without the snow, it is not easy to imitate the uniformly moist state without creating a moss-covered surface. The only thing I know of, and I have many times tried it with fair success, is cocoa-nut fibre. This material retains moisture, and it may be moistened from below without producing the bad results, e.g., sourness of soil, &c., that follow a similar practice when soil is so moistened. In the case of very minute and choice seeds, I favour the following as a means of retaining uniformity of moisture:—Let a 5-inch pot be placed inside an 8-inch one, so low that the smaller pot is 1 inch below the larger one, to allow of a sheet of glass or slate being put over the top; then let the intervening space be filled with cocoa-nut fibre refuse or fine coal-ashes, and the inner pot for the seeds, filled to the extent of one-third with crocks, and the remainder with the cocoa-nut fibre refuse, made firm by ramming it with another pot. By plugging the hole in the larger pot with cement, a water-tight condition is secured, the space between

the two pots to be afterwards retained for supplying moisture. A little watchfulness will keep this to about the height of the crooks, which will afford all the moisture necessary. Seeds that are but lightly covered, or not covered at all, require much care, and much loss is the result of careless or indifferent watering overhead, and not a little by over dryness, particularly when the sides of the pots are exposed to external conditions. On the other hand, in view of the long season required by some seeds to germinate, and the waste of time when failure ensues, it is quite worth while to call in the aid of the microscope to decide, if possible, the fertility of the seeds. This is most helpful in the case of purchased seeds, and those possessing even a small knowledge of the varying characteristics of such seeds will find it of much service. *H. Jenkins, Hampton Hill.*

BOOK NOTICE.

THE BOTANISTS OF PHILADELPHIA AND THEIR WORK. By John W. Harshberger, Ph.D. (Philadelphia, 1899.)

THE first thing that strikes the reader who has only a very general acquaintance with American botany is the large number of devotees of the *amabilis scientia* here enumerated. It must be remembered, however, that Philadelphia, for the purposes of this volume, comprises a radius of 60 miles from the centre of the city, and that the list begins with James Logan (1699), and comprises records of all those now living. It is difficult to review a book of so varied a character as this, but we may say that the reader interested in horticulture or botany will highly appreciate the details here given of the early history of botany in the United States, and of the various gardens and other institutions which have from time to time been established.

The biographical details relating to the botanists will be read with the greatest interest, though the qualifications for entry of some seem to be rather meagre.

The materials here afforded for the gradual evolution of a new national type are valuable. One gentleman, for instance, born in Philadelphia, comes of German ancestry on the father's side; whilst on the mother's side—Scotch, Irish, English, and Sclavic elements, have intervened. Many others, on the contrary, remained Britons though they have crossed the sea, and technically adopted another nationality.

One of the most interesting biographical sketches is that of our old correspondent, Prof. Meehan:—"He was born at Potter's Bar in 1826, and was at one time an alumnus of the Royal Gardens, Kew. It is claimed for him that, when about thirteen years of age, he succeeded in hybridising (cross-breeding) the Fuchsia for the first time, producing a race which he named St. Clair. Mr. Meehan emigrated in 1848, and from that time to this has poured forth an uninterrupted series of interesting observations, which it is to be hoped he may be able to collect and co-ordinate. As a citizen of Philadelphia, Mr. Meehan has also been a most valuable worker. Many improvements, such as the establishment of numerous small parks (some of historical interest), being due to his energy. At the same time he has built up a nursery at Germantown, of which it is said in no other place are American trees and shrubs raised in such quantities.

These few particulars, which are all that our limitations allow us to give, will show what a valuable contribution to the botanical history of the district Dr. Harshberger has made. His book is indispensable to those who want to refer to the life-histories of the botanists, and to gain an insight into the numerous botanical establishments of the State, past and present.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Orchards.—When the trees in orchards are grown in the form of bushes and pyramids, any pruning that is found necessary should be carried out upon the same lines as those adopted in the pruning of trees in the garden. If space will admit (and an allowance should always be made for it when planting), the branches should be allowed to extend outwardly as well as in an upward direction, so that ultimately the crowns will be spread widely. To this end, the points of the main branches need only to be tipped, until such time as the trees encroach upon each other. When that should occur, the approaching branches must be more severely cut back. Pears and Apples cultivated in this manner produce an abundance of fine, clean fruits, if crowding of the main branches be avoided. Bushes, &c., which are crowded in regard to the inner branches of the crowns should have these reduced in number, in order to let light into the centre. In the case of Plums, the wood may be left somewhat more thickly, bullfinches and tomatoes, &c., usually devour the flower-buds largely when the trees are situated in a quiet orchard. Orchards are not now so often planted with standard trees in the vicinity of the kitchen as was formerly the case, bushes and pyramids having superseded them. Where, however, orchards of standards exist, the trees will need but a cursory examination if they are annually accorded proper attention; but if neglected, they will require a thorough and careful pruning. There is a tendency, now that gardeners are taking greater interest in hardy fruit-culture, to prune too much, with the result that the fruit crop is greatly reduced in quantity, and the health of the trees injured. The granting of Certificates by the Hereford County Council to pruners who can prove to the satisfaction of a qualified examiner, by practical demonstration, that they are competent, is a step in the right direction, and only such men should be employed by those requiring the services of a tree-pruner. At present the supply is not equal to the demand, but this is a matter that will be remedied in the course of time. Other counties in which fruit is largely grown would do well to take a hint. The heads of neglected trees should be carefully thinned out, and crossing and interlacing branches removed; but the removal of large limbs should, if possible, be avoided. When such amputation is inevitable, let the wounds be painted over of a lead colour as soon as dry. Neglected trees frequently become infested with injurious insects, and with moss and lichens; and in some parts Mistletoe is often allowed to sap the energies of the trees unduly. This parasite can soon be destroyed by cutting out every growth seen. The best insecticide is caustic soda wash, previously mentioned, applied by means of an ordinary garden engine and a length of indiarubber tubing, fitted with a sprayer, so as to reach the topmost branches of the trees. This kind of work is most effectually carried out on a calm day. Another good remedy to use against lichen and insects is to dust the trees when damp with fresh lime. If the land is impoverished let a dressing of farmyard or of artificial manure, be placed on the area in which are the roots, and lightly dig the land, taking care to chop up the turf in the case of orchards under grass.

Plums and Damsons are likewise the better for a periodical thinning of the branches; young standards not being overlooked. All the whip-like growths should be shortened back, these generally coming to grief when fruit-laden if left at full length. In orchards under turf the latter should be dug up for a distance of not less than 3 feet from the stems.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain Holford, Westonbirt, Tetbury, Gloucestershire.

Asparagus.—In making a new plantation, a situation well open to the sun and not too much exposed to the wind should be selected for its site. The land should be drained with pipe or rubble drains, trenches dug out as for Celery, and a thick layer of farmyard-manure placed at the bottom, and the soil returned to the trench. Soil of a very stiff nature should be made suitable by adding sand and

road-scrappings to the staple, &c., and be left exposed to the weather till the beginning of the month of April, and after being scuffed, should be made level and well trodden regularly all over, in readiness for planting. Two-year-old seedlings of either the Giant, Connover's Colossal, and Argenteuil should be procured and placed a distance of 2 feet apart, the roots spread out horizontally and regularly, and then covered with sandy loam of good quality, and in such a manner that the crowns may be brought about 3 inches under the surface. As Asparagus-roots are injured by exposure to the air, the plants should be transferred from one situation to another without needless loss of time. Good heads will be obtained if none is taken till the fourth year. Many gardeners adhere to the older method of cultivating this plant in beds of not less than 4 feet wide, with alleys 2 feet wide running between. The produce grown in this manner is of middling size, the edible part greener, and flavour more delicate than that grown in any other manner. In preparing such beds, the soil should be dug out 3 feet deep, some faggots or brushwood placed at the bottom, and well decayed manure to the depth of 2 feet placed thereon, and the whole covered 9 inches deep with lightish soil. The roots may then be planted as previously advised, the beds when finished being about 6 inches above the alleys, into which rain and snow water may drain away from the beds, and thus render them warmer than would otherwise be the case.

Peas.—Where warm borders exist, seeds of Marrowfat varieties, as Chelsea Gem, William Hurst, Gradus, and Sutton's Little Marvel, may be sown in drills, 2 to 3 feet apart. Let the sowings be made moderately thick, and the drills about 2 inches deep, the early sown seeds being liable to rot if buried deeper. In order to preserve the seed from the depredations of mice, roll it in dry red lead. Against sparrows and pigeons use "figure-of-4 traps" or wire guards. As soon as the plants are visible, draw a little earth up to them, making the moulding higher as the plants get taller; and when 3 to 4 inches high, put small bushy sticks to them, so as to afford the haulm support.

Broad Beans.—The plants that have been raised in boxes under glass, will now be fit for transplanting in the open. Take them out without injuring the roots, and plant them in drills drawn 5 feet apart, placing each plant 6 inches apart, and if the plants have been properly hardened off, they will need no sort of protection. This year they need not be afforded water to settle the soil about them. Seed may also be sown in warm sites, putting in a few extra seeds to make up any vacancies that may occur.

Cauliflowers.—All plants which have been wintered in cold frames, should have the fullest exposure, and in about three weeks time they may be planted on a border facing west, or one at any rate that is sheltered from the north and east winds. It is preferable to plant in deepish drills drawn about 15 inches apart. After planting, apply fresh soot to the land and over the leaves. Lime may also be used against birds and slugs.

Vegetable Roots.—Carrot or Parsnip-crops should be lifted before they start into growth, and stacked in small heaps, crowns pointing outwards, sand being placed between the layers. If the place they are stacked in is cool and dry, the roots will be available for several weeks. Turnips in heaps or buries should be inspected, and all those which are found to be started into growth may be removed, and heeled-in in some open spot for the production of tops. The rest of the Celery-crop may also be lifted, and heeled-in close together on the north side of a wall.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

Eranthemum pulchellum.—The deep blue-coloured flowers of this old favourite stove plant always attract attention at this season of the year, there being so few flowers of so pure a blue. If a plant be well grown, it is astonishing for how long a period of time the flowers are produced, although a single flower fades in a day or two. All faded blossoms should be removed at short intervals. When a plant is past flowering it should be cut over, new shoots taken as cuttings when these are 3 or 4 inches in length, inserting them singly in small 60's, and rooting them in bottom-heat of 80°. When a

cutting is well-rooted, pinch out the point, and allow the plant to remain in the same pot until it breaks; by this plan, every bud from the pot upwards will grow, and a quite bushy plant will be secured. In repotting from the cutting stage, use 6-inch pots, and as a potting-compost chiefly strong loam. In the summer season the plants should be grown in pits, with slight shade in sunny weather, and any very strong shoots should be stopped. In October the plants should be removed to warmer quarters; in the flowering season mild liquid-manure frequently afforded is beneficial.

Euphorbia Jacquiniaeflora.—Continue to propagate this plant as fast as strong shoots fit for making cuttings can be obtained. If the stock of the plant is short, the old stems may be cut into pieces 2 or 3 inches in length and utilised; but cuttings having a heel of older wood make the better plants. The cuttings should be inserted singly in small pots (or thimbles) filled with peaty soil, covering the top with silver-sand, and plunging in brisk bottom-heat; or six or eight may be put into a 48-pot, and not divided when repotted. The cuttings should not be allowed to flag or damp off.

Gardenias in bud and flower will require the application of liquid-manure, or a light top-dressing of artificial manure mixed with soil; afterwards copiously affording the plants tepid water. Let the flower-buds and shoots be thinned if these are too abundant.

Zonal Pelargoniums.—The improvement in recent years, brought about by numbers of raisers, has made these varieties of the Pelargonium quite a feature of indoor decoration. For winter-flowering, the plants require special preparation, and to be only grown for one season. Plants which have been kept rather dry at the root will now furnish firm shoots very suitable for making cuttings, which, when made, should be put singly into small pots filled with sandy loam, and placed in a temperature of 55° to 60°, in a light position, fully exposed to the sun. When rooted, remove the cuttings to cold pits, keep close to the glass, and remove the sashes entirely during favourable weather. The cuttings should be allowed to become quite pot-bound, and the wood hard, before potting them in the pots in which they will bloom, which should be performed about the middle of the month of May. Remarks as to summer treatment will appear later.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Cherries.—With such low temperatures as have prevailed, and the almost complete absence of sunshine, rather more than the usual amount of firing will be needed to bring these trees steadily along. In houses where the flower-stalks are extending, let air be freely afforded on all favourable occasions by the day, and a small amount at the top of the houses during the night, in order to give strength to the flowers. Water should be cautiously afforded, a steady degree of moisture in the soil being aimed at from the present time until the blossoms are set. A slight mulch a few inches thick, if placed over the borders, will be an advantage, by reducing the need of frequent applications of water. Such trees as are opening their flowers should have the pollen distributed daily by means of a soft brush.

Pines.—The work of potting, re-arranging plants, and the provision of a steady bottom heat for the growing season, are the most important operations of the year in the culture of the Pine-apple, and every detail should be carried out with the greatest care. Carefully crock a sufficient quantity of 12-inch pots for fruiters, and 8-inch ones for succession plants, and then advantage may be taken of the first mild day to carry out the work. Where the bottom heat will be supplied by tan and leaves, these should be made in fit condition for use; and a bed at least 5 feet deep provided to maintain a steady heat for several months. If hot-water be used for bottom heat, there will be much less labour, and only sufficient material in which to plunge the pots will be needed: the soil at potting time should be moderately dry, so that it may be rammed firmly around the balls without becoming in the least degree pasty. The soil should be of the best fibrous loam of a light nature, from which the finer portions have been removed. Add to this

some bone-meal and a little soot, and a sprinkling of fine charcoal. Each plant must be given the pot-room it needs. If the leaves are broad and brittle, showing sturdy health, and the roots light-coloured and healthy, a good shift may safely be given at this season. Repot all the strongest succession plants first, and place them in proper height and order for replunging in the beds. Follow on with the smaller and later successions, and arrange them in their proper quarters as speedily as possible. Plants in fruit or showing fruit may be benefited by removing a few of the older leaves from their base, and giving them a good top-dressing of fibrous loam and horse droppings. The droppings should be passed through a coarse sieve, and be well blended with the loam. The bottom-heat must be closely watched for a time, and if there is a tendency to excessive heat, the pots should be gently swayed to allow it to escape. A heat of 80° to 85° at the roots, and a top-heat of 70° at night and 80° by day, with sun-heat, will suit the fruiting plants, while 10° lower all round will be sufficient for successions. Water must be applied very carefully, for anything approaching a sodden condition at the roots would be most injurious. Spray the plants lightly with the syringe on fine sunny afternoons.

Strawberries.—High quality and flavour are best obtained by placing the plants in a well-ventilated position in a moderately high temperature, and an atmosphere not overloaded with moisture, and by affording water moderately at the roots. In the case of succession plants syringe them freely, to check red-spider, and on no account allow them to become dry at the roots. Plants passing out of flower should have some of the setting fruits removed without delay, and they will need to be fed at every watering with clear liquid-manure up to within a week of the ripening stage. Later fruiting varieties—Leader and British Queen—may now be put into late vineries and Peach-houses about to be closed; and if frames are plentiful, the whole stock may be started gently, and they will thus be ready to fill vacancies that may occur in the houses.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Ilchester, Abbotbury Castle, Dorset.

Pelargoniums that have been potted recently, and now show signs of fresh growth, may have the leading shoots stopped in order to induce a branching habit. In common with all bedding plants, Pelargoniums should now be given ventilation on all possible occasions.

Hardy Annuals. A sowing of these may now be made on prepared ground in the front of herbaceous borders, and in patches at suitable spots in shrubberies, the seeds being sown when the soil can be worked easily. When the seeds have been sown, some finely sifted soil may be used for covering them. Very small seed should be merely covered, and the soil pressed gently. Larger ones, as those of Lupinus and Poppies, may be sown deeper. To secure a succession of bloom, sowings may be made each month until midsummer.

A Selection of Dwarf Hardy Annuals.—The following species may be sown in limited space in the herbaceous border, or in separate beds in the flower garden; or about the mansion:—Adonis, Acrocliniun, Asperula oerulea, Bartonia aurea, Callirhoe species, C. Loreri, Candytuft species, Silenes armeria and pendula, Clarkia integrifolia and varieties, Collinsia, Dianthus sinensis and D. Heddewegi, Eschscholtzia (new strain), Eutoca viscidula, Ipomopsis, Godetia, Kaulfussia, Oxyura Chrysanthemoides, Leptosiphon, Limnanthes Douglasii, Linaria tristis, Platystemon californicus, Sanvitalia procumbens, Schizopetalon Walkeri, Whitlavia grandiflora, Xeranthemum various, and Mignonette. All of the above should be given positions where they will receive direct sunshine during a portion of the day. Mignonette succeeds best on virgin soil; failing this, a good proportion of crushed mortar-rubble mixed thoroughly in the soil will accelerate its growth.

Half-hardy Annuals.—Prepare hot-beds for the sowing of seeds of Lobelia, Pyrethrum, Golden Feather, Celosia cristata and C. pyramidalis, Jacobaeas, Phlox, Zinnias, Petunias, Perilla nankinensis, Antirrhinums, Stocks Intermediate and East Lothian. The seeds may be sown in large boxes, or in rows close to the glass in frames. Such plants as Lobelia and Pyrethrum should be

given space that will admit of their making growth. It is best, therefore, to sow thinly, so as to obtain plants large enough to be handled. As Stocks and similar plants become large enough to prick out, they should be placed in a cooler frame. Large seeds, as those of Ricinus, Datura cornucopiae, &c., should be sown singly in small pots.

General Remarks.—Specimen Agaves, Chamaerops, Musa (Bananas), Bamboos, &c., that will be used on terraces, should be overhauled. The leaves may need to be sponged, and the tubs require to be repainted. If any of the tubs are rotten, the plants may be put into new ones by means of a tripod and winch used overhead, rollers being used beneath the heaviest specimens, and a screw-jack used in lifting the ball. If the plants do not require a larger tub, the measurement of the new ones should be made as exact as possible. Any space then occurring when the plants have been placed in them may be filled in with very fine earth.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Saccolabiums.—With few exceptions these plants love heat, and succeed under similar treatment to that recommended in my "Calendar," last week, for Aerides and Vandas. In dealing with them individually, however, there are a few minor, yet essential points to be considered. They may be divided into two classes, viz., those having thick leathery leaves, such as S. guttatum, S. Blumei, S. ampullaceum, S. curvifolium, S. giganteum, S. Hendersonianum, S. praeorsum, &c.; and those with thin leaves, as for example S. calceolares, S. bellinum, and S. bigibbum. Those of the first group are evidently intended by Nature to withstand severe drought, and consequently under cultivation they should only be afforded a limited supply of water when root action is not proceeding. Abundance of atmospheric moisture during the growing period is desirable, but at other times any excess is apt to cause the leaves to fall away. In houses where an uniform degree of humidity is maintained during the winter, no actual water should be afforded the plants for weeks at a time, if the leaves do not show signs of shrivelling. With species of the second group require a moderately moist base at all times, though during dull moist weather, less harm will result from dryness at the root than from a superabundance of moisture. Remoisting and other such work may now be done.

Angraecums are seldom represented in collections, except by A. sesquipedale, and one or two others. They may all now be afforded fresh sphagnum-moss, and, where practicable, clean drainage. The species named above, with A. virens and A. eburneum, being large and strong growing plants, should be grown in pots, but others thrive best grown in baskets or pans and suspended; and excepting A. falcatum, which grows best in the Cattleya-house, they all require an East Indian-house temperature. The essential points in their cultivation are that they require abundance of moisture at the root and in the atmosphere, rather dense shade, and pure air; but air must not be admitted in a manner to cause cold draughts to impinge on the foliage. Large and frequent supplies of water being essential, the drainage and sphagnum-moss should be such that water will soon pass away or evaporate. During the winter months the sphagnum-moss may become moderately dry before being again wetted.

Ventilation and temperatures.—Dry cold winds are generally prevalent at this season, and in conjunction with the increased solar heat, they are very trying to the plants. The disparity between the outside temperature and that desired inside, compels the employment of a large amount of fire-heat, and this increases the aridity of the inside atmosphere. In mitigation of this undesirable condition, air should be admitted very sparingly, and shading employed during the brightest portions of the day. To maintain atmospheric moisture, frequent damping of surfaces will be needed, though, as I have before stated in these columns, it is not wise to keep wetting those parts of the floor-surfaces where it is soon dissipated. Where there occur unusual climatic conditions, a slight increase of the night as well as the day temperatures should now be given in the warmer houses. The desired degree should, however, be determined by the prevailing local conditions.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, MAR. 13 { Royal Horticultural Society's Com-
mittee, Meeting.
THURSDAY, MAR. 15—Linnean Society, Meeting.

SALES.

MONDAY, MARCH 12.—Roses, Fruit-trees, Greenhouse Plants, Hardy Perennials, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, MARCH 14.—Japanese Lilies, Ornamental and Decorative Plants, 500 Azaleas, Begonias, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.
FRIDAY, MARCH 16.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—42° 3'.

ACTUAL TEMPERATURES:—

LONDON.—March 7 (6 P.M.): Max. 44°; Min. 36°.
Dull; cold wind.

PROVINCES.—March 7 (6 P.M.): Max. 45°, S.W. Ireland;
Min., 28°, S.W. coast.

It is of the utmost importance at the present juncture that the Council of the Royal Horticultural Society should make the Fellows of the Society conversant with the details of their proposed scheme, to which we alluded last week. At present we know nothing beyond this, that in the annual report allusion was made to the proposals made for celebrating the centenary of the Society in March, 1904. After considering various proposals, the Council, we are told "have decided to recommend the acquisition of a new garden." [The italics are our own.] According to the report of the proceedings of the meeting, the President repeated this statement, but in place of the words decided to recommend, he is reported to have said that the "Council has decided . . . to celebrate that event (the centenary) by the purchase of a new Chiswick, a new experimental garden in a rural district that shall take the place of Chiswick, and probably by the establishment there of a horticultural college, and a thoroughly efficient method of giving theoretical and practical horticultural education." But the President had no further information to give the meeting. Negotiations, he said, were then in progress, and at that time the Council was not disposed to divulge how far these have progressed. This was all that was said.

We protest most earnestly against the view taken that the adoption of the report of necessity carries with it acquiescence in the details of a scheme which were not, and have not been up till now, laid before the Fellows. How can the Fellows acquiesce in anything which is unknown to them?

We have in these columns so strongly advocated the promotion of education, and the advancement of research as essentials in the promotion of horticulture, that we are not likely to dissent from the general principles that it is desirable to have an experimental garden, and

that one duty of the Society is to promote the education of young gardeners, and to advance both the theory and the practice of horticulture.

A new experimental garden in lieu of Chiswick may or may not be desirable. Out-door cultivation near London becomes increasingly difficult by reason of fog and smoke, but the soil of Chiswick is no more irremediably exhausted than it is in the neighbouring market-gardens.

The cost of the establishment, it is true, is disproportionate to the results obtained. A large part of the funds of the Society and much of the energy and labour of the officials is thrown away in the cultivation, and specially in the distribution of plants to the Fellows. These plants are mostly of little or no horticultural interest, and might individually be purchased for a shilling or less at any nursery.

The big vinery also can only be looked upon as a white elephant. Its removal would not diminish the utility of the gardens. It is costly to maintain, and any educational value it may have might be obtained at much less cost.

It is still possible to do useful work at Chiswick, especially under glass. A few acres of land in some fairly accessible place in the country would suffice for the trials of vegetables or hardy flowers. Such work as this might be done at comparatively little cost. Not so with the establishment of a Horticultural College. This arouses our gravest apprehensions. Some of the still active members of the Society have seen the Society brought to the very brink of ruin twice during the last half century. One of the finest libraries of its kind in existence had to be disposed of, herbaria were sold, models of fruit and other valued possessions were dispersed. Later on, within the recollection of many of us, the Chiswick Garden was reduced to the comparatively small area it now occupies. The collections of trees, and shrubs and fruit trees of historic interest, were destroyed.

The state of affairs at, and preceding the migration from South Kensington can only be looked back upon with feelings of abasement and humiliation.

The Society is now flourishing, because it has been well directed, and minds its own business. To embark on such projects as have been only outlined, seems once more to court disaster. Perhaps when we are told how it is going to be done, these forebodings may give place to feelings of another kind. We trust it may be so.

In any case is it an unheard of thing to commit the Fellows to a course of action fraught with such all important consequences, without affording them any explanation beyond the baldest hints. It may not have been judicious to divulge more when the negotiations were pending, but when they are completed it is essential that the Fellows should have the opportunity of considering them before a contract is signed, and we have too good an opinion of the Council to suppose that they will not see the wisdom and propriety of taking such a step.

MISS ORMEROD.—The University of Edinburgh has, says *Nature*, decided to confer the honorary degree of Doctor of Laws, in recognition of her services to entomology.

LINNEAN SOCIETY.—On the occasion of the evening meeting, Thursday, March 15, 1900, at 8 P.M., the following papers will be read:—I. "Report on the Botanical Results of an Expedition to the Mt. Roraima in British Guiana," undertaken by Messrs. F. V. McCONNELL and J. J. QUILCH. By Mr. W. Botting Hemsley, F.R.S., F.L.S., and

others.—II. "Bryosae from Franz Josef Land," collected by the JACKSON-HARMSWORTH Expedition, 1896-97. By Mr. A. W. WATERS, F.L.S., &c.

APPOINTMENTS FROM KEW.—We learn that an extraordinary demand for trained gardeners for positions of importance has been experienced at Kew within the last year or so. In addition to changes of situation which have occurred in the ordinary way, nineteen appointments have been filled by the authorities. Amongst these are nursery-foremen, head gardeners, assistants in the Royal Botanic Gardens, Calcutta (N. GILL and W. F. GREEK); superintendent, Agri-Hort. Society, Madras (B. CAVANAUGH); superintendent, Parks and Gardens, Shanghai (A. ARTHUR); Curator, Botanic Station, Accra (W. BROWN); Agricultural Instructors for the West Indies (A. J. JORDAN and M. McNIEL); Curator, Botanic Gardens, Antigua (W. N. SANDS); Assistant Superintendent, Botanic Gardens, Trinidad (W. LESLIE). These appointments have all been filled from the improver-gardeners employed at Kew, i.e., young men who after five years training in good private gardens or nurseries enter Kew for a two years' course.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Floral and Fruit Committees of the Royal Horticultural Society will be held on Tuesday, March 13, in the Drill Hall, James Street, Westminster, from 1 to 4 P.M. On this occasion a lecture on "The Evolution of Plants, illustrated by various garden strains coming true from Seed," will be given at 3 o'clock, by Mr. IRWIN LYNCH, of the Botanic Garden, Cambridge.

BOTANICAL CONGRESS.—In connection with the Paris Exhibition, a botanical congress will be held from October 1 to 10. Members of the congress will pay a subscription of twenty francs, which will cover the expenses of printing the report. The president is M. PRILLIEUX; the secretaries are MM. GUÉRIN and LUTZ.

"NATAL PLANTS."—It is highly satisfactory at this time to receive from Natal the second part of *Natal Plants*. This consists of a series of quarto lithographs, with accompanying descriptions, from Mr. MEDLEY WOOD and Mr. MAURICE EVANS. In the present number we find various plants of garden interest, such as *Cyrtanthus Mackenani*, t. 51; *Leonotis leonurus*, t. 53; *Hemantthus natalensis*, t. 58.

GARDENERS' CHARITY GUILD.—The annual smoking concert on behalf of the funds of the Gardeners' Royal Benevolent Institution will take place on March 14, at the Great Hall, Cannon Street Hotel, at 7.30 P.M.; chairman, N. SHERWOOD, Esq.; secretary, THOMAS SWALES, Esq., 5 and 6, Clement's Inn, Strand. "The entertainment will take the form of a cigarette concert, in order that ladies may be invited."

ROYAL GARDENERS' ORPHAN FUND.—At a meeting of the committee of this Fund held on the 2nd inst., Mr. H. B. MAY, Dyson's Lane Nursery, Upper Edmonton, was unanimously elected chairman, in succession to Mr. WM. MARSHALL.

AMERICAN FLORIST COMPANY'S DIRECTORY FOR 1900.—In addition to the usual fully corrected and revised lists of florists, seedsmen, nurserymen, parks, cemeteries, botanical gardens, societies, &c., issued by the American Florist Company, 324, Dearborn Street, Chicago, this year's edition of this Directory, which is now ready, contains lists of all the leading gardeners, horticulturists, landscape architects, &c., in the United States and Canada. This book will enable traders on this side to reach the best purchasing classes in North America. The price, post-paid, is 2 dols.

RUSSIAN FRUIT.—Mr. P. Stcherbina, horticulturist, of Simpheropol, Crimea, Russia, has sent us some elaborate and beautifully prepared tables, showing the qualities of the best sorts of Cherries, Plums, Apricots, and Peaches, as observed during eighteen years. The first column contains the

name of the variety, then come eleven columns showing the degree of hardihood; 2, the vigour of the tree; 3, its fertility; 4, its size; 5, its quality; 6, its firmness; 7, its market value. To each of these an allotted number of points is assigned, and these numbers are added together in a column of totals. In addition the time or season in which the fruit is available, its form and colour, are given in separate columns, but these are not numerically assessed. To give one example we may say that *Grosse Mignonne* Peach has for the column above mentioned 8 points, 8 for vigour, 8 for fertility, 10 for size, 9 for quality, 8 for firm-

9 A.M. A heavy fall of snow occurred on the 13th, by next morning there was an average depth of 3½ inches; at the commencement of the fall, a deal of the snow thawed as it fell. The barometric pressure has been very variable, the lowest reading was 27.92 inches on February 19, at 5 P.M.; and the highest 29.85 inches on the 18th, at 9 P.M. The temperature—registered by a thermometer 3 feet from the ground, and facing due north—has ranged from 18° Fah. on the 7th, and again on the 9th, to 56° on the 26th. The first fortnight of the month was characterised by sharp white-frosts and bright sunny days, with an easterly or north-easterly

TABLE DECORATION.—*Moderne Tafeldekoration*, von OTTO WAGNER (Erfurt, 1900: Bindekunst-Verlag: J. OLBERTZ). This book should prove of great use to all who are interested in table decoration, for it deals with a subject very indifferently represented in English publications. As a nation, we certainly do not excel in arranging light and elegant floral decorations, the efforts, even of professionals, being often forced, and resulting in the overloading of the table and the annoyance of the guests who are separated by heavy masses of greenery and flowers, which precludes conversation with the opposite neighbour. Some of the plans

FIG. 48.—HEDSOR, MAIDENHEAD, THE RESIDENCE OF LORD BOSTON. (SEE P. 154.)

ness, 9 for market value (not otherwise determined), forming a total of 60 points; while *Early Beatrice* gets only 55. *Madeleine rouge* has the highest number of points, viz. 73. Eighty-three kinds of Cherries are thus tabulated; forty-five Plums, and twenty-five Apricots. Some of the sorts are not known in this country, and that circumstance added to the length of the tables makes it undesirable for us to publish them at full length.

THE WEATHER IN CORNWALL.—We learn from Mr. BARTLETT, of Pencarrow Gardens, that the rainfall at that place for the past month amounted to 5.85 inches. There were ten rainless days; the greatest fall in twenty-four hours was that of 1.48 inches, measured on February 15 at

winds; this weather culminated in the heavy snow of the 13th, and was succeeded by rough winds from the west, and mild showery weather with very little sun.

"THE CENTURY-BOOK OF GARDENING."—We have, on several previous occasions, referred to this useful book (published by GEORGE NEWNES, Southampton Street, Strand), and now note the appearance of the last part. This includes articles on foliage-plants, flowering-plants, window-box and window-gardening, and tub-gardening. Information upon soils and their treatment, and a calendar of a year's work in the garden, are included, and an index of all the subjects treated of in the twenty-six parts of the publication. The illustrations are excellent.

given in this book, such as fig. 30, when carried out would efface the chairman when he rises to address the assembly. Herr WAGNER'S Handbook is well and clearly illustrated, and by the aid of his pictures and plans many hints may be gleaned, even by those who cannot read the letterpress.

JAMAICA.—The supplement to the *Jamaica Gazette*, dated February 1, contains a full report on the working of the Botanical Department for the year ending March 31. It deals with numerous economic plants cultivated in the island; with the herbarium and library, the provision for agricultural education, and reports from the various subsidiary gardens. The meteorological records will prove valuable, as indicative of the general nature of the climate.

"BOTANICAL MAGAZINE."—The March number contains coloured figures and illustrations of the following plants:—

Stemhlopea Rodigasiana (Cogniaux), tab. 7702.—See *Gardeners' Chronicle*, 1898, ii., f. 9.

Matthiola sinuata, var. *Oyensis*, tab. 7703.—This is a native of Western France, and is a white-flowered variety of *M. sinuata*, differing from the typical or ordinary condition in the total absence of a dense greyish tomentum. The plant grows on the island of Yeu, which has been Latinised as Oya.

Ceropegia Woodii, tab. 7704.—A pretty little Asclepiad, noted by us among Mr. William Bull's novelties in 1897, ii., p. 357, fig. 104.

Cereus mojavensis (Engelmann), tab. 7705.—A dwarf, tufted Californian species, with ribbed stems 3 to 6 inches high. The spines are slender, unequal in length, and borne in tufts on the ribs. The flowers are rosy-pink.

Kniphofia rufa (Baker), tab. 7706.—A species from Natal, having linear entire leaves, and tall, loose racemes of long, yellow, tubular flowers, with projecting stamens.

HAIRINESS OF PLANTS.—Several plants, says Mr. HEMSLEY, in the *Botanical Magazine*, t. 7703, exhibit the peculiarity of densely hairy and glabrous individuals growing intermixed. *Borrichia arborescens*, and *B. frutescens*, West Indian species, are instances in point; so are *Matthiola incana*, and *M. sinuata*. We may also mention *Greyia Sutherlandii*, which produces glabrous and hairy leaves on the same bush. Such occurrences should be borne in mind when considering the theories propounded as to the causes of the glabrous or of the hairy condition.

DENDROBIUM AUREUM.—From the gardens, Gatton Park, Reigate, Mrs. COLMAN has been obliging enough to send us an abnormal flower of this species. It is a solitary flower, placed apparently at the end of a leafy pseudo-bulb, but really lateral. The two petals are in union with the column, but otherwise there was no distortion in the flower itself.

THE BRIGHTON AND SUSSEX HORTICULTURAL SOCIETY have arranged three shows to be held during the present year. The spring exhibition will take place on April 3 and 4; the summer show on August 28 and 29; and the display of Chrysanthemums on November 6 and 7. This Society is not one of those that devote their energies exclusively to the holding of exhibitions; it is a Mutual Improvement Association as well, and the syllabus just to hand with the schedule of exhibitions, shows that some very practical questions are discussed by capable gentlemen at their monthly meetings. The next meeting to be held will take place on March 15, and Mr. LEWIS BUDWORTH will read a paper on the "Rotation of Crops under Glass for Market and Private Use." The secretary to the Society is Mr. J. THORPE, 53, Ship Street, Brighton.

NEW VARIETIES OF DAHLIAS.—A supplement to the first edition of the *Official Catalogue of the National Dahlia Society*, compiled in 1898, has just been issued. This list includes forty-three new varieties, consisting of two show, two fancy, three Pompon, thirty Cactus, and six single-flowered varieties. These figures again show the extraordinary development that is occurring in that type known as "Cactus." All of the varieties are described in the list, and selections of twelve varieties of most types for exhibition, and for producing effect in the garden are given, and will doubtless be useful to all cultivators, whether exhibitors or not.

THE NATIONAL DAHLIA SOCIETY has just issued its report for the past year, and a schedule of prizes to be offered at the next exhibition, which

has been fixed for September 7 and 8; at the Crystal Palace. Several new classes have been added, that will afford exhibitors greater opportunities than heretofore to demonstrate the decorative qualities possessed by Dahlia flowers, and some of them have doubtless been introduced by the Society with a view to finding some less inartistic method of exhibiting the blooms than upon flat show-stands, as in the case of show and fancy varieties, or great symmetrical triangular bunches, as in the case of those of the "Cactus" section. There are classes for sixty blooms not more than two of a sort, and for twenty-four blooms distinct; in either case to be shown with Dahlia-foliage. Then in Class 10 the exhibits are to be of "twelve varieties, six blooms of each, to be arranged with any suitable foliage in vases. The stems may be stiffened with wires, but no wire-frames may be used. The quality of the blooms will be the first consideration with the judges." Similar competitions will occur also in the classes for amateurs. Another innovation will be the exhibition of "Cactus" Dahlias in pots. We would recommend the Committee to impose some regulation upon exhibitors, that shall secure that the flowers staged will be neatly and effectively labelled. At previous shows of the Society, the untidiness and want of uniformity in this matter has been such that would scarcely be tolerated at any other floral exhibition. Greater care should also be taken in respect to varieties that are given certificates on the day of the show. The confusion of the labels last year rendered the work of the representatives of the press most difficult. The Society has an excellent Secretary in Mr. J. F. HUDSON, Gunnersbury House Gardens, Acton.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the lecture-hall of the Institution on Monday, Mar. 12, 1900, when a paper will be read by Mr. J. SHIRESS WILL, Q. C. (Associate), entitled "Underground Water." The chair will be taken at eight o'clock. Members who are graduates of any of the recognised Universities of the United Kingdom are requested to intimate the fact to the secretary of the Institution, in order that the same may be indicated in the next issue of the list of members.

THE NEWCASTLE FLOWER SHOW.—The schedule of prizes to be offered by the Durham, Northumberland, and Newcastle-upon-Tyne Botanical and Horticultural Society at their show in Newcastle, on July 25, 26, and 27, 1900, embraces sixty-seven classes. The nine plant classes include one for a group of miscellaneous plants for which a sum of £22 is offered; and separate competitions for Orchids, Gloxinias, Cordylines, Codiaums, Begonias, &c. The feature of the section for cut flowers will be Roses, and there are classes for flowers of perennial herbaceous plants, Violas, Carnations, and for flowers arranged in various form of decorations. A number of classes are also arranged for fruits and vegetables in season at the time the show will be held. The Secretary is Mr. J. B. REID, Mosley Chambers, 30, Mosley Street, Newcastle.

KEW PUBLICATIONS.—We have received a copy of the *List of Published Names of Plants Introduced to Cultivation 1876-1896*, and of the *Handlist of tender Dicotyledons cultivated in the Royal Gardens, Kew*. The titles alone show the importance of these publications, to which we shall probably refer on another occasion.

AGRICULTURAL EDUCATION.—Sir WILLIAM THISELTON-DYER took the Chair at the last meeting of the Society of Arts, when Mr. HEDGER WALLACE read a paper on "Agricultural Education in Greater Britain." The lecturer had much of interest to say about planting, as distinct from farming, and when discussing the vexed question as to whether a fit training for life in the colonies

was to be obtained in England, pointed out that the gardeners who left Kew carried with them some knowledge of the culture of economic tropical plants. These, however, are not a large proportion of those who enter upon a colonial life, and while the principles of plant-culture are the same all the world over, even the conditions of colonial farming practice are not to be properly learned over here. In great detail, Mr. WALLACE surveyed agricultural education in its widest sense throughout our colonies in elementary schools, where the subject is considered more important than it has hitherto been here at home in special schools, stations, and colleges. The effects of the imperial and other governments to benefit both white and coloured culturists were gone into, including the work of the new department in the West Indies. In fact, a most valuable contribution to the state of our knowledge on the subject was the result of Mr. WALLACE's efforts. In opening the discussion which followed, Sir WILLIAM THISELTON-DYER made many suggestive remarks upon the culture of the soil in England, pointing out how private enterprise had done much here which public authorities had to do abroad. This is, fortunately, quite true, but may it not tend to lead our Government to look to individual effort in many cases where it should itself take the lead.

HEDSOR.

SITUATED near Maidenhead, Bucks, on a commanding eminence at 200 to 300 feet above the Thames, from which it is rather more than half a mile distant, stands Hedsor (fig. 48, p. 153), the seat of Lord Boston. The situation rivals in respect of natural scenery the adjoining estate of Cliveden. The approach to the house from the Taplow side is by a carriage-drive of rather more than a mile in length, running through woodland and park, and flanked by a free growth of Rhododendrons for a considerable distance, also by Conifers of good dimensions. There are fine specimens of *Pinus excelsa*, *Sequoia sempervirens*, *Cryptomeria japonica*, and others.

The mansion stands on the crest of a ridge which overlooks the valley of the river Thames, which is very picturesque at this part. The mansion, rebuilt in 1862, in the Italian style, is of white brick with stone coigns and dressings; from it a grand view of the Thames and district is obtained. The pleasure-grounds surrounding the house are undulating. There is no flower-garden proper, but several beds are planted in the summer with Cannas, which are here much in favour, and others are filled with Pelargoniums in variety. These beds are in the spring made gay with multi-coloured varieties of Wallflowers, with Violas, *Silene pendula*, and a variety of spring-flowering plants. Tea Roses are rather profusely planted in borders and beds.

Attached to the mansion is a conservatory that is kept continuously gay with plants brought from the cultivating-houses in the kitchen-garden, which lies at a considerably lower elevation. Walking in the pleasure-grounds surrounding the mansion, good views are obtained over the river and neighbourhood, some of which are kept open by cutting back the trees when they encroach and threaten to obscure them, and in other instances peep-holes or tunnels are cut through the arboreal vegetation. Thus views are obtained of Cookham and Cookham Weir, and the Maidenhead district, while extensive views of open country are seen to the west and north-west over Marlow, and towards the Chilterns. On one of the Oak-crowned knolls in the park there stands an ornamental castellated structure that forms a pleasing object in the view from the mansion and other points.

Another carriage-drive from the south-west side leads up from the Thames valley, off the Cookham and Wooburn roads—a considerable ascent. The parish church of Hedsor is at a short distance from the mansion. Here rest the remains of

Fleming, for many years gardener at Cliveden, and famous for his introduction or popularisation of apring bedding.

THE GLASSHOUSES.

Very near to the church is situated a portion of the glasshouses, arranged on two sides of a square, devoted principally to Vines and Peaches. The Vines in the earliest house were pushing freely into growth at the time of my visit, the forcing, for a variety of reasons, not being early this year; but Grapes from this house have been out in April for several years past. The next is a succession Vinery; a small connecting house is occupied by a Fig-tree. Then follow a Peach-house, and two lean-to vineries, but somewhat badly placed, being shaded considerably by an adjacent building and some high trees; although good crops of fruit are annually obtained. Near here a house with a north aspect contains *Asalea indica* in variety; and passing through a doorway on to the south side, is a house filled with *Souvenir de la Malmaison* Carnations in good health is reached. The variety *Princess May* is noticeable for its exuberant growth—evidently a plant having a good constitution. Several heated pits are also found at this point filled with bedding plants.

The principal plant and fruit-houses are in the kitchen gardens, situated not far distant, but at a much lower level, a hundred or more feet below the mansion. Owing to the steepness of the paths, considerable labour is entailed in moving plants, &c., to the house and conservatory adjoining it.

THE KITCHEN GARDEN

has an area of several acres within the walls, and nicely trained trees of the usual kinds of fruits cover the different walls. Cordon Apples and Pears skirting some of the asphalt paths are in fine health, and bristle this year with fruit-buds.

The houses here are arranged so as to form a quadrangle, and consist of two ranges of hip and span construction; a couple of lean-to vineries, a span-roofed flower-house, besides heated pits with a sunken path running throughout. Entering the span-house standing at the end of these ranges, devoted to flowering plants, from which supplies go to the mansion and conservatory, I was struck with the fine appearance of a batch of *Lachenalias*, interspersed among *Primulas* and *Cyclamens*. *Lachenalia tricolor* is grown extremely well in 48-sized pots, and as many as thirty-two flowers were counted on one spike. *Solanums* raised from seed early last year had made finely-berried bushes in 32 and 24-sized pots. These had proved useful, furnishing plants throughout the winter, and were still very full of fruits, and fresh in appearance. They are treated on the planting-out method during the summer, and lifted early in the autumn and potted. Seedlings for producing this year's batch of plants were just pushing up strongly in the seed-pans. *Richardias* are also grown in quantity, and treated somewhat similarly in the summer. *Euphorbias* (*Poinsettias*) were also numerous, and apparently the plants had been very fine. Besides cut flowers used in decorations in the mansion, others are furnished for church decoration, Lord Boston wishing special attention to be given in this direction, and large quantities have to be furnished on the occasion of Church festivals, as at Easter. Chiefly for this purpose, one house is now filled with *Lilium longiflorum* var. *Harrisii*, of which Lily Mr. Wood is a very successful cultivator, he having produced as many as eleven flowers on a spike last season. The plants in question look very promising, with deep green foliage quite to the base. Mr. Wood finds that this is best attained by not putting the bulbs deep in the pots, but by keeping them rather high, and not burying them more than half their height in the soil when first potted. Later on a small quantity of loam and fibre are added as a top-dressing, and weak liquid-manure from the cow-stalls is afforded. A house is devoted to the cultivation of *Codiaeum* (*Crotons*), a favourite table-plant at Hedsor, many of which are grown as well as half-specimen plants.

Several dozens of young recently-struck plants from cuttings were in small 60's, and others were being rooted on the plants, the stem being cut round, and a small 60-size filled with light soil fitted to it. When the small pot has become filled with roots, a 4½-inch pot is used for re-potting before the plant is severed from the parent. When the latter is partially filled with roots, the old plant is allowed to gradually become very dry at the root, and then the young plant may be safely removed without the loss of a leaf. This method produces the most perfect table-plant, especially of such long and handsome-leaved varieties as those of the *Warreni* type.

Among the varieties, the pretty small-leaved *Erstedii* was noticeable with brightly-spotted yellow on a greenish-ground foliage; this also remains in a good condition when used for room-decoration, much longer than other varieties. *Sunbeam* is a new and promising variety; *Prince of Wales* was very fine, as were also *ruberrimum*, *picturatum*, *Hammondi*, an improved *Countess*, *Sceptre*, *Aigburthiensis*, and many others.

Dracenas are also well grown, and the tops of plants are rooted similarly to the *Crotons*. It was found that when removed after rooting into the small pot only, the bottom leaves were lost after re-potting; but when this was effected on the plant some time previous to removal, a perfect plant resulted without the loss of any bottom leaves. Lord Wolsley is a variety of noted excellence as a table-plant.

A batch of *Eucharis* growing on the back stage was in robust health, and the small size of the pot when compared with the size of the plants proved what may be done in this way. Over-potting has undoubtedly wrecked many collections of these plants. Rough fibrous loam and charcoal is the potting medium here used.

Seedling Palms raised from home-grown seeds are not of frequent occurrence, but Mr. Wood has for two or three years past flowered and seeded a couple of specimen-plants of *Cocos Weddelliana*, and young plants are now growing from some of these seeds. This Palm appears to thrive unusually well at Hedsor, young plants growing away with that vigour so desirable in the variety. The plants are kept in pots comparatively small for their size.

The next house is chiefly devoted to *Gardenias*, there being a fine batch of plants in 7-inch pots struck from cuttings last April, and promising an abundance of blooms. Young plants are grown on yearly, and the old ones thrown away after flowering. A portion of the roof of this house was covered by a fine *Stephanotis floribunda*, from which one large fruit was hanging, just changing from green to yellowish shade, and much larger than a hen's egg. A batch of *Pancratiums* was also good.

Two houses are devoted to two kinds of Orchids, one to *Celogyne cristata*, and the other to the old *Dendrobium nobile*, two of the most generally useful Orchids; and a fine sight they presented here. The *Dendrobiums* were fast opening their flowers, some three dozen or more of plants growing in plants ranging in size from a 6-inch to one of 16 inches diameter, and the larger plants each carrying many hundreds of blossoms. Grouped together with the admixture of a few Maidenhair Ferns and Palms the effect was very good. Of the large batch of *Celogyne*, many of the spikes of blossoms had been cut, but sufficient remained to show that the cultural requirements were well understood, the vigorous spikes, deep-green foliage, and fine pseudo-bulbs, showed the plants were in perfect health. A few of the plants are divided annually, and as these do not bloom much the following year after division, a good supply of strong flowering-plants is maintained by dividing one or two plants annually. All are grown in shallow square pans about a foot in diameter.

Other houses in these ranges are occupied by Peach-trees, two in a promising condition. With

one house, the latest, Mr. Wood remarked there had been considerable difficulty for several years in saving sufficient buds to secure a crop, so persistently had they dropped; but the past two seasons the lights had been taken off in the autumn, and allowed to remain off the house until the trees were pruned in February, with the result that the bud-dropping trouble had disappeared.

Another house had been re-planted with *Muscot* Vines last season, and they had made strong canes. A similar-sized house is filled with French Beans in pots in two batches, the earliest in nice bearing; and quantities of young Tomato-plants were quickly reaching a state suitable for planting-out. In a long range of heated pits in three divisions, the staging being very near to the glass, is a quantity of furnishing-plants coming on, including a large batch of herbaceous *Calceolarias*, which are here favourites, although not so often met with in gardens as formerly. The plants are in 7 and 8-inch pots, and in a very promising condition. One division was filled with *Adiantum cuneatum*, the fronds of which are in great demand for furnishing; and large quantities of that useful old double *Pelargonium*, *F. V. Raspail*, are grown for autumn and winter-blooming; while a batch of that favourite *Begonia*, *Gloire de Lorraine*, was still flowering freely.

Chrysanthemums are also well grown at Hedsor, and the young stock of plants were starting away well into growth.

The improved forms of the *Cactus Dahlia* are grown in quantity, and Mr. Wood has utilised a novel structure for wintering them in, and that is a disused gasometer, stood on a level surface, a doorway having been made for entering the iron structure. The roots are here plunged in a good depth of cocoa-fibre refuse, and a lamp-stool inside in severe weather to exclude frost. In the summer capital crops of Mushrooms are grown from beds made up as soon as the *Dahlia* roots are removed. The gardens have for some years been under Mr. Wood's charge, and it is pleasing to note that Lord Boston takes a lively interest in his garden, and the welfare of his employees generally. C. H.

THE MADRESFIELD CLUB PRUNING COMPETITION.

THIS competition is one of a series organised by the Madresfield Agricultural Club, whose operations cover only a portion of the county of Worcester.

The efforts of the club are at last aided by a grant from the County Council of some £150 per annum, for the purpose of affording technical instruction by experts, on the various subjects taken in hand, in the shape of demonstrations and lectures, followed by competitions amongst the pupils or others. The subjects dealt with thus far embrace winter or summer pruning, mowing, reaping, hedging, coo-perage, machinery, pole pitching, rick building, thatching, sheep management, shearing, and other rural pursuits; competitions are also held for best cultivated gardens or allotments. Prizes are likewise awarded for long service. There can scarcely be any doubt that this organisation is doing a great deal of good amongst the rural population, direct and indirect, even beyond the club's area.

This year instruction classes were formed, and a beginning made in January, and pupils were placed for one month's instruction and practical work under able fruit-growers, in their orchards or gardens. Each pupil received 12s. per week towards his expenses, suitable tools being found by the club. At the expiry of the time, including the winter's demonstrations and lectures held in widely separated districts, a pruning competition was arranged.

Fifteen competitors entered, and fourteen answered the roll call. Class A. was for farm-hands only, whilst Class B. was open. Two Apple, one Pear, and one Plum-tree were selected and numbered for each competitor. Duplicates of these

numbers were taken by two stewards appointed and balloted for, which identified each set of trees for each pruner. The trees were selected as nearly equal in size as possible. At a given signal each pruner-commenced his task, and as soon as he had completed it, he returned to a flag set up in the orchard, where the stewards registered his time and identification, for the purpose of estimating the point value. Various styles of pruning were adopted, one of the competitors using the primitive mallet and chisel.

The trees were orchard standards, and had been about seventeen years planted, with healthy, clean, fruitful growth, in fact, this orchard happened to be one of the first planted from the home-nursery on the Madresfield estate, and proved well adapted for the competition. Mr. Wright, of Chiswick, was appointed examiner and judge of the work. His awards gave the utmost satisfaction; after which Mr. Wright addressed the company (which was a large and keenly interested one), pointing out the defects of the unsuccessful ones, and addressing words of encouragement to all. He also reported to the Club Committee as to the highly satisfactory character of the work done by the pupils, especially those who had received a month's practical instruction, and who had, of course, succeeded in carrying off nearly the whole of the prizes. There are matters of national importance, and are to be continued and enlarged. *W. Crump, V.M.H., Madresfield Court.*

REPORT ON THE PRUNING COMPETITION, 1900.

I am very pleased indeed to be able to make such a satisfactory report on the work of the competitors in the pruning competition. With two exceptions, all the competitors exhibited not only very careful training, but also great care and pains in doing their work thoroughly well, showing an excellent knowledge of how trees should be pruned in order to make healthy trees capable of producing full crops of fine fruit. In a great fruit-growing county like Worcester, it is very difficult to estimate the value of such sound teaching as has been given; the effects will be of material value in the orchards of the future, and have an influence for good in the county and in the country at large. In my opinion it is a most important work, deserving of every encouragement, particularly amongst young men, who will naturally have much to do with the future management of orchards. I may add that the competitors did their work better, and showed a clearer grasp of the work than any other class of men that I have examined in any other county on the same subject. *S. T. Wright, Superintendent of the Royal Horticultural Society's Gardens, Chiswick.*

SOME SUSSEX FRUITS.

III.—THE FIG.

GREEN FIGS! The mere mention of the name of this delicious fruit makes my mouth water. I shall probably blot this page before I have done, for as it will take me some time to tell the story of the Fig-tree, my salivary glands will suffer from strain, and the oval orifice fail to keep guard. You cannot sympathise with me, you say. I am sorry for you. Perhaps you never ate a Sussex Fig; if so, I do not wonder at your mouth remaining dry. Come down next year to the famous Fig-gardens at West Tarring. You may enter and take your fill for sixpence, but, if I am not mistaken, the proprietor will be the loser by you. Nowhere in England can such Figs be seen or tasted, for here they have been established for ages, and time does not impair their flavour or fertility. But everywhere along the Sussex coast the Fig-tree flourishes, and some tons of fruit are gathered every year.

The Fig is unique among fruit-trees in its manner of producing its flowers. In China it is on this account called the *Mo Fa Kwo*—the fruit without a flower; or, as our earlier botanists would say in

their stilted way, the *Cryptogamic* fruit. This peculiarity has been known from the days of the Greek naturalists, for Theophrastus, Dioscorides, and others, from whom the Roman Pliny borrows most of his botanical lore, have left on record their observations and ideas respecting it.

CAPRIFICATION.*

as it is now called, is thus described in the semi-scientific, semi-mythic language of the ancients. "The wild Fig, known by the name of *Caprificus*, never ripens itself, though it is able to impart to the others the principle of which it is thus destitute; for we occasionally find Nature making a transfer of what are primary causes, and being generated from decay. To effect this purpose the wild Fig-tree produces a kind of gnat. These insects, deprived of all sustenance from their parent-tree at the moment that it is hastening to rottenness and decay, wing their flight to others of kindred though cultivated kind. There, feeding with avidity upon the Fig, they penetrate it in numerous places, and by thus making their way to

FIG. 49.—SHOOTS OF THE FIG WITH YOUNG FRUITS.

"a", Fruits that may withstand the winter and ripen early;
"b", younger ones that will produce late fruit.

the inside, open the pores of the fruit. The moment they effect their entrance, the heat of the sun finds admission too, and through the inlets thus made the fecundating air is introduced. These insects speedily consume the milky juice that constitutes the chief support of the fruit in its infant state; and hence it is that in the plantations of Figs a wild Fig is usually allowed to grow, being placed to the windward of the other trees, in order that the breezes may bear from it upon them." This extract, which might be supported by many more from the ancient authors, is sufficient to show that the Fig had been the subject of careful observation, while it also reveals a good deal of ignorance as to the processes of growth and fertilisation.

Let us see how the matter stands. If a tree be examined in autumn, when the leaves have newly fallen, it will be seen that a great number of young unripe Figs remain. If the weather during the succeeding winter prove severe, the larger of these will certainly fall. There are still, however, a good many little fruits to be seen, and with ad-

vancing spring these begin to develop, and form part of the fruit of the ensuing autumn; no blossom, however, will at any time be seen. The Cherry, Apple, Quince, and other trees will be gay in spring, but the Fig-tree will retain its sombre hue, and put forth its large green leaves as if it never intended to yield a crop of fruit. There is, then, in the popular sense, no flower to the Fig-tree. The branches seem to put out young Figs without the intervention of blossoms, just as the viviparous water-nail (*Paludina vivipara*) seems to produce its young without going through the process of oviposition.

We will gather one of these green Figs, and examine its internal anatomy. If we have a microscope, and a well cut section of the fruit, so much the better. A section through a green Fig shows it to consist of a leathery bag, the interior of which is hollow. From the fleshy receptacle there are seen to grow a thousand little bodies, surmounted by hairs which all point towards the centre, and so cause the hollow portion to look like a cradle lined with wool. They may more truly be likened to the bedeguar on the Rose. These hairs are in reality the pistillate processes of the female or fertile flowers, and the little bags at their bases are the ovaries containing the seeds. If these should be fertilised and ripen, they form the small hard portions of the Fig, which so often find their way into a hollow tooth. In England, however, these seeds do not usually ripen, or at least, it is correct to say that owing to the fruit being eaten in a fresh state, they never become hard and objectionable, as they do in the case of the Turkey Fig. The Fig is provided with a scale-covered aperture, the florets nearest to which are destitute of pistils. It is well known to be a prolific bearer. In some countries no fewer than three crops may be gathered; in England we have to be content with one.

The life-history of a Sussex Fig is as follows:—If we examine a bare tree on New Year's Day in a normal season, it will present the appearance shown in the drawing. Here and there green Figs from the size of a Cob to that of a Walnut appear; many others will probably be lying at the foot of the tree, killed by the ordinary frosts. Those which we see may or may not continue to develop; if they do, they form the early crop. If they fail, however, no great harm is done. Already in the preceding autumn when the last crop was ripening, another crop was being produced, and these can now be seen coming out from almost every node of the young branches, as shown in the illustration (fig. 49). As spring advances, these will develop and form the main crop of the year. Meanwhile, another crop will come forward which is destined to fail in our climate, though in other lands it would ripen towards the end of the year. Thus, in May we have (1) any of the green Figs which survived the winter, with (2) those which at new year were in the bud, and (3) a new set coming on to form a second (abortive) crop. Again in October we find (1) the ripe Figs which were produced from the last autumn's buds, (2) the second crop produced during the summer, and chiefly destined to failure; together with (3) the young buds which are to produce next year's crop. Thus in a fertile tree there are always two if not three successive crops always in evidence.

Having stated these facts from personal study, let me quote the words of another authority. Some years ago, Mr. Kennard, the owner of some Fig-trees near Worthing, remarked to an enquirer that "though the quality varied (from year to year), there was always a crop. The Figs begin to ripen by the end of August (he added), or the beginning of September, and continued during October. The crop was generally from the spring Figs (the buds in our illustration as drawn at New Year), though occasionally a few of the autumn ones ripen; the ground was manured every autumn, and pruning being avoided as much as possible." *A Sussex Naturalist.*

(To be continued.)

* This subject was dealt with in these pages in 1883.

CULTURAL MEMORANDA.

CULTURE OF CALANTHES.

As the time to pot *Calanthes* will be here shortly, a few hints on the culture will not be amiss. At the present time the plants should be resting on a shelf in an intermediate-house, being kept quite dry. A suitable compost would consist of one part fibrous loam broken by hand, one part peat, one of leaf-mould, some sphagnum-moss chopped fine, a small quantity of dried cow or horse-dung, a few small crocks, and some silver-sand. Mix these various things together, and make the whole warm before using. The most suitable-sized pot is one of 6 inches in diameter, and for small pseudo-bulbs and certain purposes, slightly smaller ones may be chosen; the larger pseudo-bulbs going into the bigger pots. Let the pots be half filled with clean crocks, over which some sphagnum-moss must be laid, then the compost. Place one pseudo-bulb in the centre of the pot, and place some of the compost round it, pressing it firmly, filling the pot nearly to the rim, and finishing off with a dash of silver-sand. The pots should be placed in the stove on a shelf near the glass. The outside of the pots should be sprinkled daily, but no water should be afforded the pseudo-bulbs till rooting begins. When the roots have reached the sides of the pots, let some chopped sphagnum-moss be placed on the surface of the soil, into which the roots will pass in a short space of time. As the pseudo-bulbs begin to swell out, water may be afforded twice a week, and liquid-manure occasionally; shading the plants from the direct rays of the sun. With this sort of treatment I have had spikes with from forty to fifty expanded flowers on them. *A. Williams, Keele Hall Gardens.*

PLANT NOTES.

TILLANDSIA LINDENI.

Those who desire to possess a plant which, whilst being striking in appearance, and remarkable for the rare shade of blue of its flowers (*Salvia patens* blue), and the length of time that these are produced, should cultivate *Tillandsia Lindenii*. The flowering time of this plant falls in the winter months. There is one drawback, the plant seldom throws up more than one flower-shaft. Like most Bromeliads, its culture presents no difficulties, and although its proper place is in the plant-stove, the plant may be allowed to stand in a warmed apartment for a week or longer time without injury. There is presented in Müller's *Deutsche Gärtner Zeitung* for February 24 last, a figure of *Tillandsia Lindenii* with five heads of flower.

NOTES FROM THE ITALIAN LAKES.

(Continued from vol. xxvi, p. 449.)

BELLAGIO has many beautiful gardens, and in addition to those already mentioned there are two others at least worthy of remark. They differ from each other considerably; the Villa Giulia being an ideal private residence, and the other is associated with one of the large hotels bordering on the lake, being a *dépendance* thereto, and known as the Villa Serbelloni.

VILLA GIULIA.

This mansion stands in a fine position, commanding a view of both the Como and Lecco branches of the lake in quite opposite directions; its grounds appear to stretch from shore to shore across the isthmus with Bellagio itself upon the peninsula. The garden faces the Lecco branch as the ground falls in that direction. Here, again, the landscape gardener has produced many beautiful effects in association with the natural surroundings, which are distinct from those of any other garden we visited. The mansion is considerably higher

than the water-level of the lake, but the water may be reached by means of terraces, and there is a boat-house in a charming spot. These terraces are worked out of the natural rock. From the lake itself this part of the garden must be most effective. In some respects one is reminded of the garden at the Villa Carlotta at Cadenabbia, by the luxuriant growth of the vegetation; but the variations in height make amends for this, there being scarcely any level places in the pleasure-grounds.

There is a too formal flower-garden in front of the house, and it is the one thing which mars the charming surroundings. Upon the southern side of this formal garden there is a luxuriant avenue of Plane-trees, the shade from which is most grateful in the heat of noonday; and behind the avenue, there are Bamboos with that free growth characteristic of plants in this locality. The varieties of Bamboo that appear finest are similar to those already quoted, viz., *Arundinaria Falconeri*, *Phyllostachys mitis*, *P. viridi-glaucescens*, and *Bambusa japonica*, the latter being most abundant; *Nerium Oleander* is in great profusion here, and the large bushes were masses of flowers. The method of planting them is a somewhat singular one, viz., in holes where walls of stone had to be made to form the terraced walks. Thus the roots are under the walks, whilst the plants themselves are upon the outer side of the wall face. That this plan suits them is evident. Other plants in flower during our visit included blue *Hydrangeas*, and *Justicias* in quantity. In the spring-time this garden must present a blaze of beauty by the number of *Camellias*, *Azaleas*, and like plants, which are effectively grouped. Palms add to the tropical effect, there being fine specimens of *Chamaerops Fortunei*, and of *Phoenix* in variety. Conifers make grand specimens; *Sequoias*, *Cryptomerias*, upright-growing *Junipers*, vieing with each other in luxuriance. One *Juniper* in particular, an aged tree, was clothed for a height of 50 feet with the rampant growth of a *Wistaria sinensis*.

In shaded places were *Funkias* in quantity, and *Ophiopogon japonicum* which is here pricked out in the manner we use *Selaginella* in our conservatories. Of *Sophora japonica pendula* was observed a fine specimen. The useful in this garden was also prominent.

There are vineyards and Orange-groves, and *Olives* and *Mulberries* are plentiful. In the direction of the Como-branch there is a broad vista nearly half a mile in length laid down in grass with a wall on either side which is chiefly covered with *Wistaria*, and as the lake is approached, lines of erect *Junipers* on either side are most effective. Our tour of these gardens was made under the guidance of a lady, and the greatest courtesy was extended to us.

VILLA SERBELLONI.

This villa and its extensive gardens occupy the highest ground close behind the town of Bellagio. From various standpoints the views obtainable are most comprehensive, and towards all points of the compass. The higher ground behind the garden proper is well clothed with trees, which form a dense umbrageous growth and delightful shade. Here and there we saw haymaking in progress, amid some grand specimens of *Wellingtonia* (one well-placed example of which is close upon 90 feet in height), and of *Cupressus Lawsoniana*, closely approaching 60 feet. The Palms include many notable examples, especially of *Phoenix dactylifera*, with immense heads and stems fully 2 feet in thickness. Of *Chamaerops Fortunei* and *C. humilis* there are also some grand plants. One *Magnolia grandiflora* above all others towers up, a superb plant, some 60 feet or so high, and is well-furnished with branches. There are Bamboos in all favourable spots. Of *Musa Ensete* there are some large specimens, with perfect foliage. An uncommon feature, even here, is a fine group of *Dasylirions*. A considerable portion of these gardens has been formed by excavations, one eminence above another being approached by tunnels. In these excavations

were found abundant materials for making walls. Upon declivities and slopes in this part we noted several forms of Cactus, with such climbing plants as *Bignonia grandiflora*, very full of flower, and *Mandevilla suaveolens*. *Daturas* were numerous, and good effects were produced with *Hibiscus sinensis*. In sunny positions the single-flowered *Portulacas* made an effective display. As an example of the suitability of this locality for *Agaves*, an immense plant might be quoted, which has been so planted as to overhang a high wall, where it is seen to the best advantage. *Jas. Hudson.*

(To be continued.)

HOME CORRESPONDENCE.

THE QUINCE IN SUSSEX.—May I be allowed to add just a few words to the exceedingly interesting and instructive letter which appeared in your last issue above the signature of "B." I find, on reference to my copy of *A Nieuwe Herball*, and now first translated out of French into English by Henry Lyte, Esq., London, 1575, "that the Quince is mentioned (p. 707, chap. 39), as *Malus cotonea*:" and in the drawing or engraving, the fruit is there shown as an obtuse Pear-shape, boldly quartered and sutured. Dodoens says, "There be two sortes of Quinces, y^e one is rounde and called the Apple-Quince; the other is greater, and fashioned lyke a Pearre, and is called the Pearre-Quince." Then follows the description:—"The flower changeth upon purple mixed with white: after the flowers cometh the fruite, of a pleasant smel, in proportion sometimes rounde as an Apple thruste together, and sometimes long lyke a Pearre, with certayne embowed or swelling divisions, somewhat resembling the fashion of a garlyke head, and when the hearie cotton or down is rubbed of, they appear as yellow as golde," &c. This description of the fruit is like some of the present time, though in size and shape those that I have seen in Kent and Sussex have varied much, both in colour, flavour, and habit, being mostly raised from seed. The names given by Dodoens are very similar to those quoted by "B." And further, "The *codignae*, or marmelade, made with honie (as it was wonte to be made in times past), or with sugar, as they use to make it nowe-a-dayes, is very good and profitable for the stomacke, to strengthen the same, and to retain and keep the meates in the same, but till they are perfectly digested." Its other medicinal virtues are both numerous, and said to be effective and curious. In that charming little book, *The Planter's Manual*, written by Charles Cotton, 1675 (just one hundred years later than the foregoing), he speaks of the Quince more as a stock whereon to graft the Pear, about which he gives full and learned directions (p. 108. a. 31). "There is a vast difference betwixt the Apple-Quince and the Pear-Quince, of which the first has a grayer bark inclining to white, more smooth and sleek, his branches thicker and more forked, the leaves not so large, and the fruit less and more full of core. The Pear-Quince shoots out his branches more straight, has a blacker bark, and downey withal; the leaves larger, and the fruit fairer and not so full of core. And this is it you are to chuse to graft upon, for the tree will ever retain all the good qualities of the stock, will put out a much finer head, and will bear a much better fruit, &c." As Quince stocks are now much used, this is worthy of remembrance. Then he speaks of a third variety: "There is of late found out a sort of Pear-Quince called the Portugal-Quince (I believe from being brought from thence), that bear an exceeding broad leaf, and is much the best of all others." *Harrison Weir, Seven-oaks, Kent.*

— In the issue of the *Gardeners' Chronicle* for February 17, "C. A. C., Arundel," asks for the address of any factory in Italy where "cotognats"

can be obtained. Through a friend at San Remo, I obtained a parcel of "cotognata" sugar-plums, and the address of the maker. This is not the form I meant, but the substance seems the same, and they are very nice; although not impossible, they may be made of a slightly "doctored" Quince. Their price is 7 lire per kilo. The form I meant was in thick slabs, and I do not think that was in any way doctored. The makers are Gaspers, Andry & Co., Confeetteria, Svizzera, San Remo. If "C. A. C." will favour me with his right address to "Westwood," Richmond Road, Worthing, I will send him a small sample of these Quince sugar-plums. I wrote to F. & A. Longley, Quince marmalade manufacturers, at Bye, and obtained a pot. It is a jelly, with bits of hardish Quince in it, and nice enough, but not to be compared for one moment with the "cotognata" of Italy. They moreover write: "The other article which you mention (cotognata) we do not make, as the supply of Quinces is so limited in the district." Then my friend, Mr. Harrison Weir, in the *Gardeners' Chronicle* of February 24, states that Quince-cheese has been made to some extent in Sussex "from time immemorial." So I am sending him a few Quince sugar-plums, that he may see how different the "cheese" he writes of is from the confectioners' cotognata. Why these condensed fruit-pulps have been called cheese I do not know; not improbably because of the original shape given them—circular and thick, like cheeses. Anyhow, the name is silly, because they are no more like cheese than this is like chalk. After all, although the Quince grows so well in Sussex, it does not appear that it is grown there to any great extent. I suppose growers there prefer glutting the markets with Grapes. A man here told me he sold his Black Hamburgs in Brighton at 4d. a pound to get rid of them! Then, before sending to Italy for a cotognata maker, it would be advisable for someone to start a Quince plantation of ten or twenty acres, and to begin by ordering as many fruit-tree growers to prepare the Quince plants for him. It would appear that the Portugal Quince is the one usually grown, but there seems to be another, and perhaps a better one. The *Cydonia Maulei* is given a fine character in Nicholson's *Dictionary of Horticulture*—"Fruit produced in great abundance, and makes an excellent preserve." Will no one or company start a plantation of this fine fruit-tree, and start an industry of the superb cotognata? *E. Bonavia, M.D. P.S.*—I am sending the Editor a few sugar-plums, so that he may see what kind of confectionery can be made of the Quince fruit. *E. B.* [Very nice, but quite unlike the Italian kind. Ed.]

CHANGE OF POTATO SETS.—The note on p. 124 on the above subject is very timely. Doubtless, many, in common with "A. L. J.," find that home-grown sets do deteriorate after a few years, and a change of sets becomes essential. It would be of interest and value to know what influence different manures, natural and artificial, in conjunction with different soils, &c., have upon this deterioration. Here, with a light soil, and, perforce, leaf-mould almost solely for manure, we find that Potatoes degenerate quickly, and the kidney varieties, Early Aurant especially, more so than the round ones. *A. C. Bartlett, Pincarrow.*

THE NEW CHISWICK.—Referring to the editorial remarks in the last number of the *Gardeners' Chronicle*, if steps are being taken to secure a site for our new garden, may I venture to mention one point which may not perhaps receive the attention it deserves, viz., the railway facilities in reaching it. Is it not possible to find a suitable spot north or west of London within reach of one (or two if possible) of our main lines? An isolated station south means not only faulty passenger service, but also what are euphemistically termed "non-competitive rates." This may be freely translated to mean that in the absence of competition, double rates would have to be paid upon every stone, brick, or pane of glass for the houses, and every ton of manure needed afterwards. The man who "went down to Jericho" is always regarded as a legitimate object of pity, but not so the Society which voluntarily places itself in the hands of one or two of the lines south of London. *Chas. E. Pearson, Chilwell.*

FRUIT-TREES.—Under this heading (nine lines from the top) Mr. A. Markham writes at p. 109, in reference to the planting of young trees received from the nursery in connection with the extension method of training, adding, "at one time I tried

the extension plan with Peach-trees; that is, the strong shoots were laid in at full length, but seemed always to result in failure, the lower buds on the shoots not forming shoots, hence the trees were lacking in symmetry." As an old advocate of the extension system in the training and building-up of established fruit-bearing trees on walls and trellises under glass in the shortest possible space of time, I may be allowed to inform Mr. Markham that failure in the circumstances detailed in his note was not the fault of the system, but of the manner in which he attempted to carry it out. Had Mr. Markham bent the said strong shoots in the direction of the ground, and secured them to the wall or trellis with nails and shreds, or matting, as the case may be, in that position, the bend starting from the point whence the first of the young shoots are desired to proceed, say 4 or 5 ins. from the bottom of the individual shoots; the check thus given to the flow of the sap would have caused every wood-bud to push the entire length of each shoot, thereby forming good-sized fan-shaped trees the first year after planting. I repeat, had Mr. Markham done this, the extension plan would have succeeded. The cutting clean out of gross shoots in established trees is to be recommended, but in the case of young trees got from the nursery such shoots should be treated as indicated. Of course, as soon as the buds nearest the base of the individual shoots so treated have pushed into growth, shreds and ties should be removed, and the shoots placed in their proper position on the wall or trellis. *H. W. Ward.*

TURNIPS.—The season is now at hand when new Turnips will be a desirable and welcome addition to the table, and I should like to see our gardeners cultivate such varieties as those we import from France, I refer to the long-rooted sort, which appears to be the only ones imported into Covent Garden. These Turnips appear to have a root large in proportion to the top, which is not usually the case with the globular varieties generally cultivated in this country. I fail to see any reason why some of our growers, such as Mr. Smith of Feltham, Mr. Wild of Sipson, and others who have large areas under glass, should not produce these Turnips to advantage, as most of our early supplies grown out of doors have to be pulled before the root is well developed, in consequence of their tendency to bolt. The long ones imported indicate by their general appearance a very quick growth, in a very light soil. They are bunched, six to nine roots together according to size, with the tops on them, bound with a thin wisp of straw, which is first soaked to make it pliable. *T. P.*

THE WEATHER IN WEST HERTS.—The recent spell of warm weather, which lasted about a fortnight, came to an end with February. Since then the days have been cold, while the night temperatures have continued rather warm for the time of year. On the coldest night the exposed thermometer registered only 7° of frost. The ground during the past week has been getting colder, and is now both at 1 foot and 2 feet deep of only about seasonable warmth. Since March began there have been a few very light falls of rain, fine snow, and soft hail, but the amounts deposited have been altogether insignificant. During the last eleven days the weather has remained very sunless and calm, the record of bright sunshine averaging only about half an hour a day; while the mean rate of movement of the air at 30 ft. above the ground was less than three miles an hour. During the greater part of the same eleven days the direction of the wind has been some point between north and east. A selected patch of yellow Crocuses first showed an open flower on the 4th inst., which is ten days later than its average date in the previous thirteen years, and later than in any of those years since 1895. *E. M., Berkhamsted, March 6.*

DAVID DOUGLAS.—As a Soone boy, born and brought up on the opposite side of the Blairgowrie road to the late eminent botanist and traveller, and whose two sisters, Jane and Ann, I knew well from childhood, and mended their quill pens until leaving for the south, you will perhaps allow me to say with what pleasure I and other readers of the *Gardeners' Chronicle*, have perused your cordial recognition of his sterling character and his distinguished service for horticulture. I was too young to enjoy his personal friendship or recognition, my eldest brother Robert being more of his contemporary. Both served their apprenticeship under the late William Beattie, a good

gardener, and the forester who laid the foundation of the grand woods and plantations that form the crowning distinction of the fine estates of the Earl of Mansfield. By a singular coincidence, I was passing through Perth on the day of the issue of this journal, February 24, on my way home from lecturing on fruit culture at Blairgowrie, and took a friend down the Kinnoull road near to Dickson & Sons' nurseries, to see the house Mr. Beattie resided in, to which I was sent as youngest apprentice in the gardens at Soone, to fetch reports of the old gardener and veteran forester's health by my master, Mr. James Dodd, for his own information and that of the late Earl of Mansfield. Of course the old Sooneites were all of them familiar with the name and work of David Douglas, and who shall say how many boys and youths were fired with their first ambition to devote their lives to horticulture by reading of the useful life and tragic death inscribed on his monument in the parish kirkyard of New Soone. Fortunately through a long series of years the gardens around the old Palace of Soone have proved useful schools of horticulture for a liberal mixture of sound practice with true and lucid theory. But Douglas was a botanist of the rare, or even a higher type than Robert Fortune. Mr. Beattie is reported to have discovered his ability, encouraged him in his studies, and to have remarked that he would rather have one David Douglas than any number of — "Muffs." It was freely reported at the time of his death that David Douglas fell a victim or a martyr to his eager search for new plants, fruits, seeds, and flowers. His sight became greatly impaired, and he was forbidden to go out without a guide. His indomitable energy sent him forth however to be gored to death by an infuriated bull or buffalo in the 35th year of his age. It is not too much to say that not only the villages of Old and New Soone, but the county of Perth, and the whole of Scotland grieved at the untimely end of this great discoverer and botanist. All the world wondered that he had crowded so much good and lasting work into so small a space of time. Surely, too, your kindly notice of the man and his distinguished services to horticulture as well as the excellent portrait of the man given in the *Gardeners' Chronicle*, might be placed in the Lindley Library or other place of honour where other departed heroes in horticulture, who being dead yet speak to us through our gardens and landscapes, and through the flowers, plants, shrubs, and trees, with which they have ennobled and enriched our native land. *D. T. Fish.*

BEAUTIFUL FRUIT-TREES.—I was glad to notice "H. H. T.'s" useful article on this subject on p. 92. Through mere pedantry or prejudice, who shall say how much our landscapes, gardens, and shrubberies have been denuded of much of their beauty by reason of the barriers erected between so-called utility and beauty. Fortunately, we are at last finding out, and "H. H. T.'s" letter may do something to hasten the progress of the idea, that to clothe beauty with utility but enhances and enriches its beauty. Hence the wider planting of Plums, Pyrus, Malus floribunda, Pears, Cherries, Medlars, and Quinces. I have long held the idea that most of our garden and orchard fruits are well worth growing in our parks, fields, hedgerows, and other places, for the beauty of their foliage, or of their flowers, as well as for their fruits. The varieties of Pears named by "H. H. T." and many others vie in glory as many other trees and shrubs do, though few equal them in brightness. Crab are superb decorative plants, alike in habit, quantity of bloom, the colour of the latter and of the varied fruits. The purple-leaved Filbert, too, affords tints which are rivalled but by few other plants, while the Nuts rank among the best, and are numerous produced under hard pruning, and the treatment meted out to shrubs in shrubberies. Apples vary widely in the colour and size of their blossoms, fruits, and foliage, that in certain cases scarcely any other flowering-tree is needed unless it is the finer varieties of Crataegus. These, with "H. H. T.'s" brilliant collection of Pears, would give a brightness to many of our gardens and landscapes which are seldom so beautiful as they might be, because of the over-abundance of Hollies, Laurels, and other common evergreen species. *D. T. F.*

A GREAT SUGAR-PRODUCING COUNTRY.—At pp. 127-128 in your issue of February 24, 1900, you reproduced from *American Gardening* a remarkable article on the above subject. Thus:

"The average yield of sugar to the acre of cane is greater in the Hawaiian Islands than in any other cane-growing country in the world; and its position in this respect demands our attention. The average yield of Maui, for instance, is about 3½ tons of sugar to the acre; Hawaii's average is lowered by the smaller-producing qualities of her leeward or dry side, but would not go lower than 4 tons; Kauai, from 4 to 5 tons; and Oahu, 6 to 7 tons. There are, of course, pieces of ground, even entire plantations, on each of these islands, where the yield would greatly exceed the average of the island; one plantation of Oahu, for instance, yields 10 tons of sugar to the acre (it takes seven to eight tons of cane to produce a ton of sugar), and special yields of even sixteen tons per acre have been obtained from given sections of the same Oahu plantation." When we compare with the foregoing statement of results the average yield of sugar per acre from our West Indian colonies, including British Guiana, the latter are thrown completely into the shade. Thus the average yield per acre for a long period of years in Jamaica stands at less than one ton. British Guiana, Trinidad, and Barbados yield an average of about one-and-a-half ton. Under peculiarly favourable conditions of soil, coupled with most propitious seasons, as much as five tons of sugar are produced per acre from time to time in our West Indian colonies, but this only on very limited areas, i.e., from five to some ten acres. Three tons per acre are not, however, uncommon over somewhat larger areas. By way of further comparison, reference may be made to your leading article, dated February 10, 1900, p. 88, in which you advert to the special efforts of Dr. Morris, Imperial Commissioner of Agriculture for the West Indies, relative to the improvement of sugar production by means of new varieties of cane—a new feature of cane cultivation. Thus, you say, "Several new canes, notably that known as 'B. 147,' had maintained their position, and were regarded by the planters as most valuable varieties; the amount of available sugar was at the rate of 3½ tons per acre." Of course this does not mean the realisation of a general average of 3½ tons; but if the average yield from the new varieties amounts to 2 or 2½ tons per acre, great benefit must eventually accrue to the welfare of the West Indies. Robert Thomson, late Supt. Botanical Department, Jamaica.

SOCIETIES.

DEVON AND EXETER GARDENERS'.

The subject that came on for discussion at the last meeting of the Association was "Further Experiments with Chemical Manures in Kitchen and Market Gardening," by Mr. F. W. E. SHRIVELL, of Golden Green, Tonbridge.

The experiments, which had been conducted on similar lines to those of Sir John Lawes, at Rothamsted, on cereals, were confined to garden crops, and as they had now been continued for five years on the same plot, some interesting results had been obtained. The lecturer advised his audience not to attempt mixing manures without a knowledge of chemistry, as otherwise they were very apt to put chemical ingredients together which, applied jointly, had the effect of neutralising the good effects of each other; as, for instance, lime and soot, which ought not to be applied at the same time. He strongly advocated lime on clay soils, as it had an astringent effect, besides helping the other chemicals and dung to do their work properly and economically. Such crops as Peas and Beans were essentially lime-loving plants. As a general manure, which may be profitably used on an average allotment plot, he recommended for, say, 100 square yards, 14 lb. of basic slag or superphosphate of lime, 10 lb. of kainit, and 10 lb. of nitrate of soda. The kainit and superphosphate should be dug into the ground in the winter, the nitrate of soda applied as a light top-dressing at intervals in the spring, when the plant was on the move, and growing rapidly. It was claimed that the Brassica genus grown chiefly with chemicals showed less fibrous and more cellular tissue, and, of course, were more tender-eating in consequence. He did not suggest that dung might be dispensed with, for it was necessary, and when the soil was too light and porous, or too heavy and retentive, it had its valuable mechanical uses in ventilating the soil and assisting the free passage of the gases; but the best results, he said, had been obtained by light dressings of dung and liberal dressings of chemical manures in combination. Speaking of lawns, which could not in the ordinary way be manured, he recommended a dressing of 14 lb. basic slag mixed with 9 lb. of kainit, and, later on, 5 lb. of nitrate of soda per 100 square yards. This, he said, ought to do away with Daisies and other weeds, and improve the growth of the sward.

Mr. P. C. M. VERRON presided, and spoke of the advantages accruing to the members of such societies in having so lucidly placed before them the interesting results of such a continuous series of experiments.

CHESTER PAXTON.

A MEETING of this Society was held at the Grosvenor Museum on Saturday, when by special request the Hon. Secretary, Mr. G. P. MILN, delivered a lecture on the "Artificial Cross-fertilisation of Cereals and Grasses." Although one of the objects of this Society when first started was to encourage agricultural as well as horticultural research, this is the first lecture on a purely agricultural subject that has yet been delivered to the members. Mr. Miln prefaced his remarks by giving some interesting particulars of the improvements that has taken place in the breeds of horses, cattle, and sheep during the present century, and which have led to such beneficial results to British agriculture. But it was not, however, until quite recently that actual new breeds of farm-plants had been produced by means of artificial cross-fertilisation. The lecturer explained in detail the methods adopted in securing improved breeds by the means of artificial cross-fertilisation, and stated that to the agriculturist "plant-breeding" was almost as of great importance to him as was the judicious stock-breeding of horses, cattle, and sheep. The lecture was copiously illustrated by a series of specially-prepared lantern-slides, which embraced all the reproductive organs of plants, as well as illustrations of comparative results between some of the old and the new breeds of cereals and grasses.

Added interest was given to the meeting by an excellent collection of some two dozen varieties of Apples staged by Mr. N. F. BARNES, Eaton Gardens, and which included The Queen, Lord Derby, Newtown Wonder, Rymer, King of the Pippins, Winter Calville, D'Anjou's Seedling, King of Tompkins County, Allington Pippin, Scarlet Nonpareil, Mère de Ménéage, Sandringham, Beauman's Red Winter Reinette, and others. These were all in capital condition, and also of excellent quality, thus demonstrating the superiority of home-grown fruit over that imported from abroad.

Hearty votes of thanks to Mr. Miln for his lecture, and to Mr. Barnes for his exhibit, brought the meeting to a close.

THE SCOTTISH HORTICULTURAL.

MARCH 6.—At a meeting of this Association held on the above date in Edinburgh, a paper on "The Crocus," by Mr. S. ARNOTT, was read by the Secretary, Mr. R. LAIRD, in the regretted absence of the lecturer through indisposition. The many contributions from Mr. Arnett to our own pages upon Crocuses and allied plants prove him to be very familiar with his subject, and save us from the necessity of referring in detail to his lecture.

There were several interesting exhibits on this occasion, including a collection of Ghent or hardy Azaleas, forced under glass; and a so-called hybrid Acacia between *A. armata* and *A. Drummondii*.

Mr. COMFORT showed a fine specimen of the *Primula stellata* in a 6-inch pot.

On the motion of Mr. MCKENZIE, the sympathy of the Association will be tendered to the families of two distinguished gardeners recently deceased, Messrs. GORRIE and FAIRGRIEVE.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period February 25 to March 3, 1900. Height above sea-level 24 feet.

Remarks.—A dull, sunless week, with cold, northerly winds and showers at intervals.

MARKETS.

COVENT GARDEN, MARCH 8.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

PLANTS IN POT.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.		s. d. s. d.
Adiantum, p. doz.	5 0-7 0	Ficus elastica, each	1 6-7 6

POTATOS.

Main Crop, &c., 70s. to 90s.; Dunbar, 110s.; Other varieties, 65s. to 85s.; Seed Potatoes from 4s. 6d. to 7s. per cwt. John Bath, 33 & 34, Wellington Street, Covent Garden.

REMARKS.—Chestnuts, Cobnuts, and Cranberries, are practically over for the season. Green vegetables, such as Thousand-headed Kale, Brussels-tops, &c., are very much down in price. Seakale also is easier in price. Among Pears from the Cape are Beurri Clairgeau, Louise Bonne, William's, &c.; but they all differ in appearance to fruits of the same varieties grown at home. Grapes from the Cape per case, 15s. to 17s. Trade generally is dull.

FRUIT AND VEGETABLES.

GLASGOW: March 7.—The following are the prices since our last:—Apples Canadian: Baldwins, 19s. to 20s. per barrel; Northern Spy, 18s. to 21s. do.; Greenings, 17s. to 20s. do.; American—Various sorts, 14s. to 18s. per barrel; Californian Newtown Pippins, 9s. to 12s. per box; Nova Scotia Apples, Baldwins, Northern Spy, Ben Davis, Golden Russets, &c., from 12s. to 18s. per barrel, according to the quality; Bananas, extras, 8s. to 9s. per bunch; No. 1, 7s. to 8s. do.; No. 2, 6s. to 7s. do.; other sorts as low as 2s. to 4s. do.; Oranges, Murcia, 6s. to 8s. per half-case; Valencia, ordinary, 420's, 10s. 6d. to 12s. 6d. per box; large, 13s. to 15s. do.; extra large, 14s. to 16s. do.; large 714's, 13s. to 14s. do.; Jumbos, 16s. to 18s. do.; some specially selected made from 18s. to 20s. (Jumbos); Seville Bitter, 6s. to 8s. per half chest; Palermo Bitter, 5s. to 6s. per box; Lemons, Palermo, 8s. to 10s. per case; Grapes 3s. to 4s. per lb.; Mushrooms, 10d. to 1s. 3d. per lb.; Tomatoes, Teneriffe deeps, 4s. 6d. to 5s. per box; cases, 6s. to 7s.; Onions, foreign, Valencia, 4 in a row, 5s. 6d. to 6s. 6d.; 5 in a row, 6s. 6d. to 7s. 6d. do.; Turnips, 1s. to 1s. 6d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 6d. to 8d. per dozen bunches; Cauliflowers, 1s. 3d. to 2s. 6d. per dozen; Cabbages, 8d. to 1s. per doz.; Celery, 6d. to 1s. do.

LIVERPOOL: March 7.—Wholesale Vegetable Market.—Potatoes, per cwt., Lynn Greys, 3s. 3d. to 3s. 6d.; Main Crop, 3s. 9d. to 4s. 6d.; Bruce, 3s. 6d. to 4s.; Champions, 3s. 4d. to 3s. 9d.; Turnips, 1s. 6d. to 1s. 8d. per cwt.; Carrots, 3s. 6d. to 4s. do.; Parsley, 6d. to 8d. per dozen bunches; Onions, foreign, 3s. 9d. to 6s. per cwt.; Cauliflowers, 1s. 2d. to 2s. 6d. per dozen; Cabbages, 8d. to 1s. 6d. do.; Celery, 6d. to 1s. do. St. John's.—Potatoes, 1s. per peck; new, 10d. per lb.; Grapes, English, 5s. per lb.; do., foreign, 10d. do.; Pines, English, 5s. each; Cobnuts, 1s. per lb.; Asparagus, 1s. per bundle; Cucumbers, 8d. each; Mushrooms, 1s. 4d. per lb. and basket. Birkenhead:—Potatoes, 1s. to 1s. 2d. per peck; Cucumbers, 1s. each; Filberts, 10d. per lb.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending March 3, and for the corresponding period of 1899, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1899.	1900.	Difference.
	s. d.	s. d.	s. d.
Wheat	25 7	26 3	+ 0 8
Barley	26 7	25 1	- 1 6
Oats	16 11	16 9	- 0 2

SEEDS.

MARCH 7, 1900.—Messrs. John Shaw & Sons, Seed Merchants of Great Maze Pond, Borough, London, S.E., write that buyers were few on to-day's market, and the transactions passing proved small. Many country buyers have

apparently elected to delay operating until the land becomes drier. Meanwhile, Clover seeds all round keep steady in value; whilst Tares point upwards. Full prices are asked for Mustard and Rapeseed. There is no alteration this week in either Peas or Haricots. A small arrival is noted of new Canadian Wonder Beans. Fine samples of Scarlet Runners are offering cheap. Canary-seed has advanced a further shilling per quarter. Liverpool now takes the lead so far as this article is concerned. Hemp-seed, however is dull.

Obituary.

ALEXANDER BAXTER.—The death took place on February 25, at Sundridge Park, of Mr. Alexander Baxter, late of Foots Cray Place, Kent. Mr. Baxter, who was born at Fochabers, N.B., served his apprenticeship in the gardens of Gordon Castle, the seat of the Duke of Richmond and Gordon, and was head gardener to the late Sir John Pender, of Foots Cray Place, for twenty-one years. He was widely respected in the Cray Valley, and much sympathy is expressed for the widow and family in their bereavement. The funeral took place at Foots Cray on the 1st inst.

ANSWERS TO CORRESPONDENTS.

ALMANACK FOR 1900: *Novice*. The correction was duly made when the error was discovered.

AMERICAN BLIGHT AND GREASE-BANDS ON FRUIT-TREES: *J. Fitzjohn*. We think that you are confusing two distinct things. Whale-oil alone, and soaps made from soft soap, or Gishurst compound-soap, the former at the rate of a $\frac{1}{2}$ lb., and the latter 2 ozs. per gallon of water, will destroy American-blight after a time. The grease-bands are strips of paper laid on other grease-proof paper, and smeared with cart-grease, which are then affixed to the Apple-trees as traps for the crawling females of the winter moth. These bands must be put on the trees not later than the second week in October, and the smearing must be repeated whenever it is seen that it has lost its stickiness. Whale-oil can only be applied in the depth of winter.

BOOKS: *A. D. B., Erfurt*. *The Effects of Cross and Self-fertilisation in the Vegetable Kingdom*, by Charles Darwin (London, John Murray); and *The Various Contrivances by which Orchids are Fertilised by Insects*, same publisher.

CARNATIONS: *H. S.* The leaves show a fungus in a young and undeveloped state. Probably it is the Carnation-rust, *Helminthosporium*.

CARPET-BEDDING: *A. Alder*. *Santolina incana* is sometimes used, as also *Calceola*. The brilliant yellow mossy plant may be *Sedum acre aureo-variegata*, or *Stellaria graminea aurea*.

GARDEN PERIODICALS PUBLISHED IN CHICAGO, U.S.A.: *H. Ganzler, Smyrna*. *American Florist, Gardening*, and *The Weekly Florists' Review*.

LEE A. AMABILIS: *Novice*. This plant is a native of the tropics, and is of easy culture in a moist hot-house in this country. Propagation is by means of slips and cuttings struck on good bottom-heat in a close case.

NAMES OF FRUITS: *R. H. W.* 1, Pear, Ne Plus Meuris; 2, Apple, Winter Quoining; 3, A., Dredge's Fame; 4, A., Gooseberry; 5, A., Beaumann's Red Winter Reinette; 6, A., Cockle Pippin.—*H. F.* Small examples of Keeping Red-streak.—*H. P.* The fruit which reached us was rotten, but it appears to be a highly-coloured Blenheim Orange Pippin.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Enquirer*. 1, *Lælia harpophylla*; 2, *Geenera macrantha*; 2 (Orchid), *Odontoglossum tripudians* (said to have white flowers); send better specimen and some particulars about the plant. Why put two specimens under one number? *J. B.* *Dendrobium speciosum*, an Australian species.—*J. F.* 1, *Acacia platyptera*; 2, *Acacia Drummondii*.—*A. J. C.* *Eriostemon myoporoides*.—*G. W. C.* *Lonicera fragrantissima* and *Dendrobium Pierardi*.—*A. J. R.* All except 3 are remarkably good forms of *Dendrobium nobile*, 7 being *D. nobile nobiliss*, or an equally good form; 3

closely resembles the garden hybrid, *D. × Ainsworthii*. It would be interesting to state whether it was imported with *D. nobile*, or is of garden origin.—*A. B.* 1, *Cordyline australis*, often called *Dracæna* in gardens. The other two seedlings cannot be called *Dracænas*; 2 appears to be the blue *Agapanthus umbellatus*; and 3 some species of *Rhiphodia*; or, as it is often called, *Tritoma*.—*A. B.* The white, or nearly white form of *Dendrobium crassinode* is by no means common. Yours seems also to be a large variety of it.

MORELLO CHERRY, &c.: *A. F.* The Morello Cherry bears mostly on the shoots produced the previous year, and to a small extent on short, natural spurs springing from the old shoots. Figs may come true from seed; it is uncertain. The Fig can be increased by cuttings, layers, grafting, and budding. *The relation of leaves to growth*—If you pick off the leaves from any plant, or part of a plant, you check the growth of the entire plant, or of that part which is denuded of leaves, as the case may be, the apparatus by which new shoots, leaves, wood, &c., are developed being taken away.

PALMS INJURED: *F. B.* From the appearance of the plant sent, we think there is little doubt but the injury has been wrought by the tar used upon the stages. But similar effects would be produced upon young Palms if the roots were even once permitted to become quite dry, and especially if the atmosphere of the house at the time was arid. In any case, it would be well to encourage a greater degree of atmospheric moisture.

PLANTING INTERMEDIATE CANES OF GRAPE-VINES: *A Young Gardener*. Two feet to two feet and a half apart would be a suitable distance at which to plant, taking out each alternate Vine when there was danger of crowding the foliage, that is in the second year after planting. In planting between permanent Vines or rods growing at 4 feet apart, the young Vines must take the mid-line between two old ones.

PLANTS TO FLOWER AFTER GERMAN TEN-WEEK STOCKS HAVE CEASED TO FLOWER: *H. A. J.* You might plant *Gladiolus gandavensis* in variety, and the large-flowered German Asters, such as *Victoria*, *Truffaut's* *Pæony*-flowered, *Pyramidal Bouquet*, &c.

POTATOS: *A. J. B.* One of the stages of the Potato disease.

THE SOWING OF VARIOUS SEEDS: *M. J. W.* The seeds of *Amaryllis Belladonna* should be sown thinly in seed-pans, just covering them with soil to the extent of their thickness. The soil used may consist of sandy loam, or of stiff loam made porous by the admixture of one-eighth sand or road-grit, and a quarter of the whole may consist of leaf-mould. The soil should be finely sifted, and below it and over the corks there should be put a layer of soil siftings of the size of horse-beans, to which in most cases the roots of the seedling bulbs will become attached, feeling their removal but little when pricked out later. A temperature of 50° to 65° will be sufficiently high. Sow forthwith. *Hunnemannia* is a hardy biennial; and *Pentstemon cordifolius* and *Phacelia grandiflora* are hardy perennials, any of which may be sown at the present time in pots or pans, filled with moderately rich sandy soil, and placed in a common garden frame; or they may be sown in the open ground in the middle of April, pricking out the seedlings in nurse-beds, or in the case of those raised in the frame into boxes or deep seed-pans.

COMMUNICATIONS RECEIVED.—*Platanus Orientalis*.—*H. A. J.*—*T. C.*—*W. C. L.*—*H. W. W.*—*D. T. F.*—*H. C.*—*Geneva*.—*S. A.*—*E. B.*—*H. H. T.*—*A. P. B.*—*Wild Rose*.—*A. S.*—*H. M.*—*H. R. W.*—*O. J. W.*—*M. Gebhardt*.—*R. L. C.*—*R. B. L.* & Sons.

Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE INTRODUCTION OF THE POTATO INTO ENGLAND.

Nearly thirteen years ago there appeared in the columns of this journal a series of three articles by Mr. Stephen Mitchell,* giving a summary of the history of the introduction of the Potato into this country. This account was published at the time of the exhibition at Westminster known as the Potato Tercentenary Exhibition, when books of travel and of the old herbalists connected with the subject, were shown, and lectures on the Potato, its culture and its diseases, were delivered. Mr. Mitchell's excellent narrative put on record all the available evidence at that time existing of the actual facts, but two recent publications have brought to light a few most interesting facts, and have caused us to go over once more the well-reaped field of enquiry, and to glean some new scraps of information on a topic of real importance in the annals of our cultivated esculents. The two publications referred to, are a volume by M. Ernest Roze, entitled *Histoire de la pomme-de-terre*, issued in 1898, and an article from the pen of Dr. T. N. Brushfield, in the 30th volume of the *Transactions of the Devonshire Association for the Advancement of Science*, on Sir Walter Raleigh, and his supposed part

in the introduction of the Potato and Tobacco into this kingdom; a suggestive and carefully written paper, which tends to throw side-lights of importance on the question of the early travellers and colonists.

CLUSIUS.

It is beyond all doubt that the earliest recorded date of the cultivation of the Potato in Europe is that derived from the *Historia Plantarum* of Charles de l'Escluse, better known under his latinised name of Clusius, a native of Arras, in French Flanders, and the foremost botanist of his time. Somewhat altering the order of the tale as told by Clusius, so as to get the statements in chronological order, we come to the following conclusion.

In or about the year 1585 the Potato was cultivated in Italy, probably from some Spanish source, as we shall hereafter see. The cultivation was on a sufficiently extensive scale as to permit of a quantity being taken by the Papal Legate to Belgium in 1586. The envoy was of delicate constitution, and the store of Potatoes was used by him as an article of diet. One of his train gave some of the tubers to Philippe de Sivry, the préfet of Mons in the Hainaut, by whom they were cultivated, and he, in his turn, sent two of these precious tubers to Clusius at Vienna in the early part of 1588. Clusius planted them in his little garden at Vienna, and was able to take the produce with him, when he removed in July of the same year to Frankfort-on-the-Maine. The next year, 1589, he received a coloured drawing from his friend Philippe de Sivry, and noted on it the date when he received the tubers, thus:—"Taratouffi à Philipp de Siury acceptum, Vienne, 26 Januarii, 1588. Papus Peruanum Petri Ciecke." This interesting drawing is now in the Plantin Museum at Antwerp, and was probably sent thither by Clusius when he was printing his *Historia* (see fig. 50, p. 162). After this, Clusius received another drawing of the Potato-plant, this time from James Gare, jun., which reached him at Frankfort, therefore before 1593, the date of his removal to Leyden. This sketch of the entire plant, if it could be discovered in the Plantin Museum, or elsewhere, would be of especial interest to British cultivators, for Gare was a London citizen, an old friend of Clusius, from as far back as 1581 at least, when Clusius spent six months in this country on his third and last visit to our shores. Gare was also an intimate acquaintance of John Gerard, the herbalist, as we shall soon find out. Clusius, according to his custom, had sent seeds of the Potato to his botanic friends; in 1590, Dr. Laurenz Scholtz, the elder, had the plant in cultivation at Breslau, for he sent a coloured sketch of it to Caspar Bauhin, at Basel—this drawing, or a copy of it, Bauhin transmitted to Clusius, though the latter omits to mention it. Thus our *Solanum tuberosum* was being gradually diffused over the continent.

GERARD.

The first hint of its being grown in Britain is in the catalogue of Gerard's garden in Holborn, printed in 1596, which we may remark in passing, is the earliest known catalogue of any one garden.* In this list the name of "Papus Hyspanorum" occurs. Standing alone this might mean anything, but when read in connection with the *Herball* of the year following, and the enlarged edition of the catalogue in 1599, it appears that the Potato was intended, and not the Sweet Potato,

Ipomœa Batatas, Poir. The *Herball* furthermore contained the first published woodcut or engraving of the plant, which is here reproduced (see fig. 51, p. 163) from p. 781 of the book in question; and the portrait of the author prefixed to the *Herball* shows him holding a spray of the plant in his hand, thereby testifying to his pride in its possession, and his estimation of it as the most remarkable in his collection.

The account of the plant as given by Gerard should be read carefully, for several errors have arisen from his statements. He says:—"Virginia Potatoes . . . It groweth naturally in America where it was first discovered, as reported C. Clusius, since which time I have received rootes hereof from Virginia, otherwise called Norembega, which growe and prosper in my garden, as in their owne native cuntries . . . The Indians do call this plant Papus (meaning the rootes), by which name also the common Potatoes are called in those Indian countries. We haue the name proper unto it, mentioned in the title [*Battata virginiana sive Virginianorum & Papus*]. Because it hath not only the shape and proportion of Potatoes, but also the pleasant taste and vertues of the same, we may call it in English Potatoes of America, or Virginia. The temperature and vertues are referred to vnto the common Potatoes; being likewise a food, as also a meate for pleasure, equall in goodnesse and wholesomenesse vnto the same, being either roasted in the embers, or boiled and eaten with oile, vinegar, and pepper, or dressed any other way by the hand of some cunning in cookerie." *Herball*, pp. 781, 782.

The first thing worth noting in the foregoing statement is, that Gerard quotes Clusius as reporting the plant as being brought from Virginia; and he cites him as though the statement had been published, and was perfectly well known. It so happens that at this time Clusius had not published on the Potato; all that he had to say about it came out in 1601 in his *Historia*, therefore we must take it that it could only have happened by correspondence. We have no evidence of any direct correspondence between Clusius and Gerard, but there was a link between the two, and that link was Gare, as previously mentioned. Clusius mentions Gare no fewer than eleven times in his *Historia*, and fifteen times in his last work, the *Exotica*, while Gerard cites him nine times in the *Herball*. The curious thing is, that Gare sent a drawing of the entire plant to Clusius, thus establishing the fact that Gerard's plant did not come from that source. It is quite possible that Clusius in his letter acknowledging this sketch may have suggested America as the native country of the Potato, under which name all the Spanish possessions in the New World would be included.

The second thing to note is, that Gerard speaks of having procured his stock since the statement was made by Clusius. If Gerard's good faith is to pass unquestioned, he must have had some knowledge of the plant before it came into his hands, but Gerard was not famous for his straightforwardness. His garbled account of Dr. Priest's translation of the *Pemptades* of Dodoens, which was the foundation of his *Herball*, is curiously like a falsehood, and the tale he told as to finding *Peonia corallina*, Retz., growing wild near Gravesend, was exposed by his editor, Johnson, as a distinct mis-statement.* It is therefore not impossible that he set himself to mystify the readers

* *Gardeners' Chronicle*, n.s. xxv. (1890), pp. 487, 552, 584.

* See *Gardeners' Chronicle* (1876), July 8, p. 50.

* See Hanbury & Marshall, *Flora of Kent*, p. 18.

of his *Herball* as to the source whence he derived his Potatos. On the other hand, it may be charitably allowed that he was careless in many points, and did not trouble himself in matters of detail, or precision of fact. Whichever way it is to be accounted for, he certainly succeeded in leading successive generations to suppose that he had his plants by way of Virginia. *B. D. Jackson.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM NOBILE VIRGINALE, LEEMANN'S VARIETY.

THE first true albino of *D. nobile* var. *virginale* appeared at Mr. Thos. Rochford's Nursery, Broxbourne, a small plant having flowered in 1897 amongst some plants of *D. nobile*, which had been imported by Messrs. F. Sander & Co. It came as a pleasant surprise to orchidists, and it will for a long time be among desirable plants for those who affect select varieties.

From another source, J. Leemann, Esq., of West Bank House, Heaton Mersey (gr., Mr. Edge), acquired, and this year flowered, another form of it, which seems to be an advance on the former variety in that the greenish area at the base of the lip is absent, the whole flower being pure white, except the labellum which has the faintest shade of pale primrose colour. The whole flower is equal in shape to that of the best typical *D. nobile*, and its segments are of firm substance and wax-like in appearance. Mr. Leemann exhibited it at the Manchester and North of England Orchid Society on February 1, when it was unanimously awarded a First-class Certificate. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

CŒLOGYNE CRISTATA.

MR. DE BARY CRAWSHAY obligingly sends us a three-lipped flower of this species. The two additional lips are obviously petaloid stamens, forming a triangle with the normal column thus A2 A1 A3, according to the notation generally adopted where A1 represents the column or perfect stamen, and A2 A3 the two stamens of the outer row, which are usually suppressed, but which are present in the flower before us in the guise of lips. Gardeners will recognise it as a semi-double form.

WOODHATCH LODGE, REIGATE.

T. B. HAYWOOD, Esq., has succeeded for a number of years in making his garden an excellent example of the gardener's art as it is pursued in the British Isles; for everything that he takes in hand, whether fruit or flowering plants, is grown to perfection, and neatness and trimness are observable everywhere both under glass and out-of-doors. Mr. C. J. Salter, who is the gardener at Woodhatch, cultivates most subjects with success, and especially the showier and more popular flowering plants. In evidence of this fact we may point to the Chrysanthemum which he grows superbly. Of late years the collection of Orchids has grown considerably, and at the present time the greater proportion of the plant-houses are devoted to them. These Orchids and other plants afford a grand display of bloom, this spring each of the houses, while being allowed to retain the plants which are regularly grown in them, containing in many cases specimen plants in bloom.

DENDROBIUMS.

The hybridisation of Dendrobiums has been successfully carried out at Woodhatch, and these plants afford at the present time the greater part of the show. The types with which experiments have been made are *D. × splendidissimum grandiflorum*, and the more distinct forms of *D. nobile* and *D. aureum*, and by means of careful selection a

fine race of spring-flowering crosses, showing a great variety of form and colour, and in some instances marked improvement on *D. splendidissimum grandiflorum* has been obtained. The strain is certainly remarkable for freeness of growth and flowering, and for the desirable habit of holding up their flowers to view.

By passing through the cool Odontoglossum-house which faces due east, and in which thrifty plants were noted, flowers of Odontoglossums were

direction has resulted from crossing *D. × Ainsworthi*, Woodhatch variety, with *D. nobile roseum*, the resultant cross now splendidly in flower being called *D. × Virgil*; its large wax-like flowers are of pure white, the only colour being the usual dark purple centre of the class. Other distinct selected forms are *D. × picturata* (*aureum × Ainsworthi* variety), a very pretty and distinct white flower, margined with rose, a peculiar feature being a bright chrome-yellow blotch on each side of the purple disc on

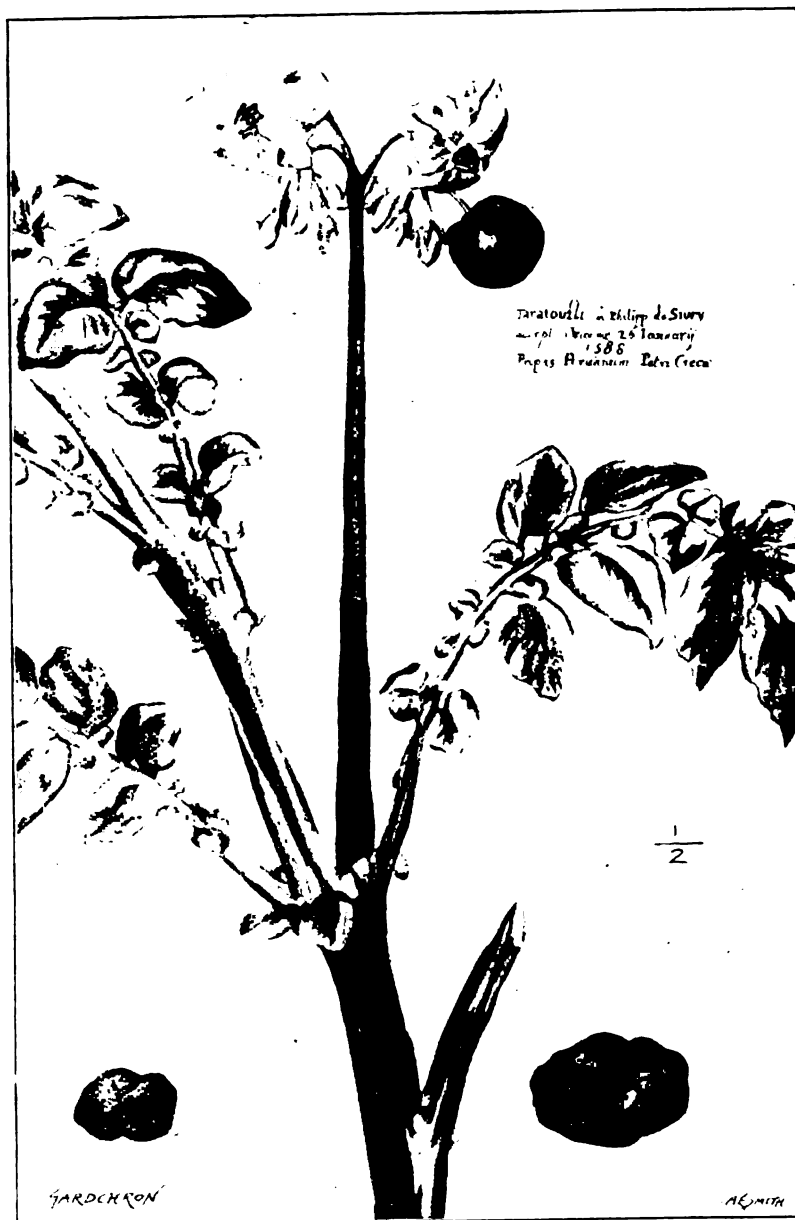

FIG. 50.—REDUCED COPY OF THE COLOURED DRAWING OF THE POTATO BY CLUSIUS (1588); REPRODUCED FROM M. ROZE'S "HISTOIRE DE LA POMME DE TERRE." (SEE P. 161.)

seen to be interspersed with those of *Maedevallias*. In the range in three divisions facing south was found a glorious display of Dendrobiums in flower, all of the plants superbly grown, and many of them carry from three to seven tall, leading pseudo-bulbs, each adorned with large flowers for the greater part of its length. The distinct forms are grouped together in batches, one of the best being the nearly white-petalled *D. × Ainsworthi*, Woodhatch variety, the white being finely contrasted with a disc of dark claret-purple on the lip. A further advance in this

the lip. *D. × splendidissimum giganteum*, the largest of its class, and brightly coloured; *D. × Homer*, and *D. × Dido*, both distinct, and comparing favourably with some hundreds of fine varieties staged in the same range, which do not show one indifferent form. The first division, which at the appeared similar to the other two, to be filled with Dendrobium plants in flower, was seen to have, as it were, an undergrowth of *Cypripediums*, among which, in bloom, were a fine *C. × selligerum majus*, two very strong *C. Rothschildianum*, *C. × Orphanum*, *C. × Calypso*

C. \times Lathamianum, C. Harrisianum superbum, C. Sedeni candidulum, and a few unnamed seedlings. Other showy plants observed in bloom in this house were two of D. \times Schneiderianum, with about forty flowers each; D. Findlayanum, D. crassinode, a well-flowered lot of D. Wardianum, just expanding their blooms, and others were suspended overhead.

The next division contained more hybrid Dendrobiums in flower, together with a very fine lot of varieties of D. nobile, the showiest of which were the richly-coloured D. n. nobilius, and D. n. Sanderianum, and the opposite of them the nearly white D. n. Ballianum. There was likewise a

P. amabilis, P. Sanderiana, and P. Schilleriana. A cool intermediate-house contained a large number of plants of *Miltonia vexillaria* in fine condition, and among them a plant of the unique pure white *M. vexillaria* Daisy Haywood, which, though still maintaining its vigour, cannot be induced to make more than one leading growth, and consequently division is impossible. There were *Cypripedium villosum*, C. Boxalli, *Celogyne cristata*, C. Lemoniana and alba, *Sophranitis grandiflora*, the graceful small-flowered *Oncidium cheiroporum*, and other species in flower. Suspended overhead were pans of *Celogyne* (*Pleione*) *lagenaria*, together with a smaller number

As evidence of careful cultivation we must not omit mention of a houseful of *Cyclamen latifolium* in fine condition; one of large, sturdy specimens of herbaceous *Calceolarias*, another of *Azalea indica*, *Primulas*, &c.; a house of *Dracenas*, *Crotons*, *Anthuriums*, and other plants, set up with *Cocos Weddelliana*, with a fine collection of species of *Nepenthes* hanging from the rafters; a large number of *Carnations* grown in pots, and a range of admirably managed vineries, Peach, and other fruit-houses. Woodhatch is by nature a beautiful place, and the interest taken in it by its owner and his gardener enhances those beauties very effectively.

BOOK NOTICE.

THE NEW FORESTRY.*

THERE can be no doubt that as a supplement to Schlich's *Manual of Forestry*, an elementary work on British silviculture, and a short treatise on the preparation of working plans for private woodlands, are required. The veteran forester, Broillard, who was from 1862 to 1880 one of the professors of forestry at the Nancy forest school, and then Conservator of forests in the Vosges Mountains till 1890, and has since been editor of the French forestry magazine, *La Revue des Eaux et Forêts*, published, in 1894, his second edition of *Le Traitement des Bois en France*,† which deals with both these questions for the benefit of French private forest owners. Broillard had considerable practical experience in managing forests before he became a professor, and as Conservator of Forests, controlled the work of a number of practical men for about ten years. All this practical experience, and all the theoretical knowledge of forestry that he gained, first as a student, and then as professor at the French National Forest School, has thus been devoted to produce a handbook of a similar scope to that attempted by Mr. Simpson. Broillard has also visited the principal forests in all parts of France, and was deputed to Germany and to Britain, to see the forests in those countries.

If, therefore, Mr. Simpson has failed to produce a satisfactory handbook of forestry, it is because of the inherent difficulty of the task before him, for which he has not had the elaborate training of Broillard, nor the wide range of practical experience possessed by that writer. It is well known among scientific men that to write a good elementary treatise on any industry based on science such as forestry, requires great practical experience, as well as a thoroughly scientific knowledge of the subject.

Mr. Simpson chiefly deals with one aspect only of forestry, that of clear cuttings, followed by artificial reproduction; and when he terms this the continental system, he is perhaps not aware that although an excellent system for Spruce, it is greatly disliked in South Germany and in France, and is followed extensively only in Saxony. In the *New Forestry* only half a page is devoted to coppice. Nothing is said about coppice with standards so common in the south of England; nor about the selection system of growing Beech by natural regeneration, which has been followed from time immemorial in the Chiltern Hills. There is no clear account of the shelter-wood compartment system of natural regeneration by seed, which was first brought to the notice of the British public in Smythies' and Fernandez' *Translation of Bagnier's Sylviculture*‡. A mere sketch is given of the highly important subject of under-planting open woods; and under the latter heading no mention is made of Douglas Fir, Silver Fir, or Weymouth Pine, all admirable species for the purpose.

* *The New Forestry: or, the Continental System adapted to British Woodlands.* By John Simpson. (Sheffield: Pawson & Brailsford, High Street; 1900.)

‡ Rider & Son, Bartholomew Close, London, 1882.

FIG. 51.—"POTATOES OF VIRGINIA," FROM GERARDE'S "HERBAL" (1597), P. 781. (SEE P. 161.)

singular orange-red *Laelio-Cattleya*, known as Woodhatch variety, in bloom, and in bud a remarkable specimen of D. \times micans.

In the third division we observed a good show of the lighter coloured hybrids, of which the white D. \times Virgil was the best. Together with those in bloom were some good *Cattleya Trianaei*, *Dendrobium crepidatum*, *Epiphrontis* \times Veitchi, and *Laelia harpophylla*. Several large fertilised seed-vessels of *Dendrobium Dalhousianum* and other species crossed with showy species, &c., which promise good results, told that good work is still being carried on.

A small, rather shady greenhouse was filled with *Phalenopsis*, the plants having attained to a size and vigour quite unusual under cultivation. Among those in bloom were P. Aphrodite,

of other species. The pans each contained a number of pseudo-bulbs which are growing vigorously, and will make a fine show of flowers in their season. Many fail to grow those pretty cool-house Orchids successfully, and yet if grown in this manner, suspended near the glass of the roof and liberally afforded water while growing, they are not subjects difficult of management. They seldom thrive, however, when placed upon a stage among other Orchids.

Another house was furnished with the smaller *Odontoglossums*, some few of which were in bloom. On the front stage a row of large plants of *Masdevallia tovarensis* was noted; and overhead were hanging plants of *Chimeroid Masdevallias*, some being in flower.

Mr. Simpson has visited forests in the Hartz Mountains and in Central Germany, he should also visit the Chiltern Hills Beech forests, the French Oak and Beech forests in Normandy, and Silver Fir forests in the Vooges; the splendid coppice with standards near Valenciennes, or in the Rhine Valley; the Larch woods in the Alps, the double-storied high forests of Oak and Silver Fir in the Grand Duchy of Baden, and the famed Oak and Beech forests of the Spessart. He would then find that the dense woods he recommends, and which are so admirably represented in his engravings from photographs taken in North Germany, are not the only possible phases of European

into harmony with modern ideas. There can now be no doubt that Brown's ideas of the practice of forestry are quite incorrect; and anyone who has seen the Forest of Dean, which was for some time managed in accordance with them, will at once perceive that the extermination of Beech, and the very open condition of the Oak woods in that forest have produced deplorable results. Mr. Stafford Howard, the Commissioner of Woods and Forests, and Mr. Baylis, the Deputy Surveyor in charge of the Forest of Dean, have however visited the splendid French forests in Normandy and near Valenciennes, and have obtained the advice of a good expert, Mr. Hill, who will shortly be Inspector-

may be planted $3\frac{1}{2}$ feet by $3\frac{1}{2}$ feet; but with Larch, and Spanish Chestnut and Alder coppice, 5 feet by 5 feet, and even 6 feet by 6 feet may be safely allowed. Broillard recommends even 9 feet by 9 feet for Spanish Chestnut in coppice.

The use of nurseries is also condemned by Mr. Simpson as one of Brown's useless hobbies, although they are essential as a protection to young Ash, Beech, Oak, and Silver-Fir, in frosty localities. An early crop of Larch cut away from Ash, provided the latter is then under-planted with Douglas Fir, or some other shade-bearer, is good financially as well as sylviculturally.

From the above remarks it appears that *The*

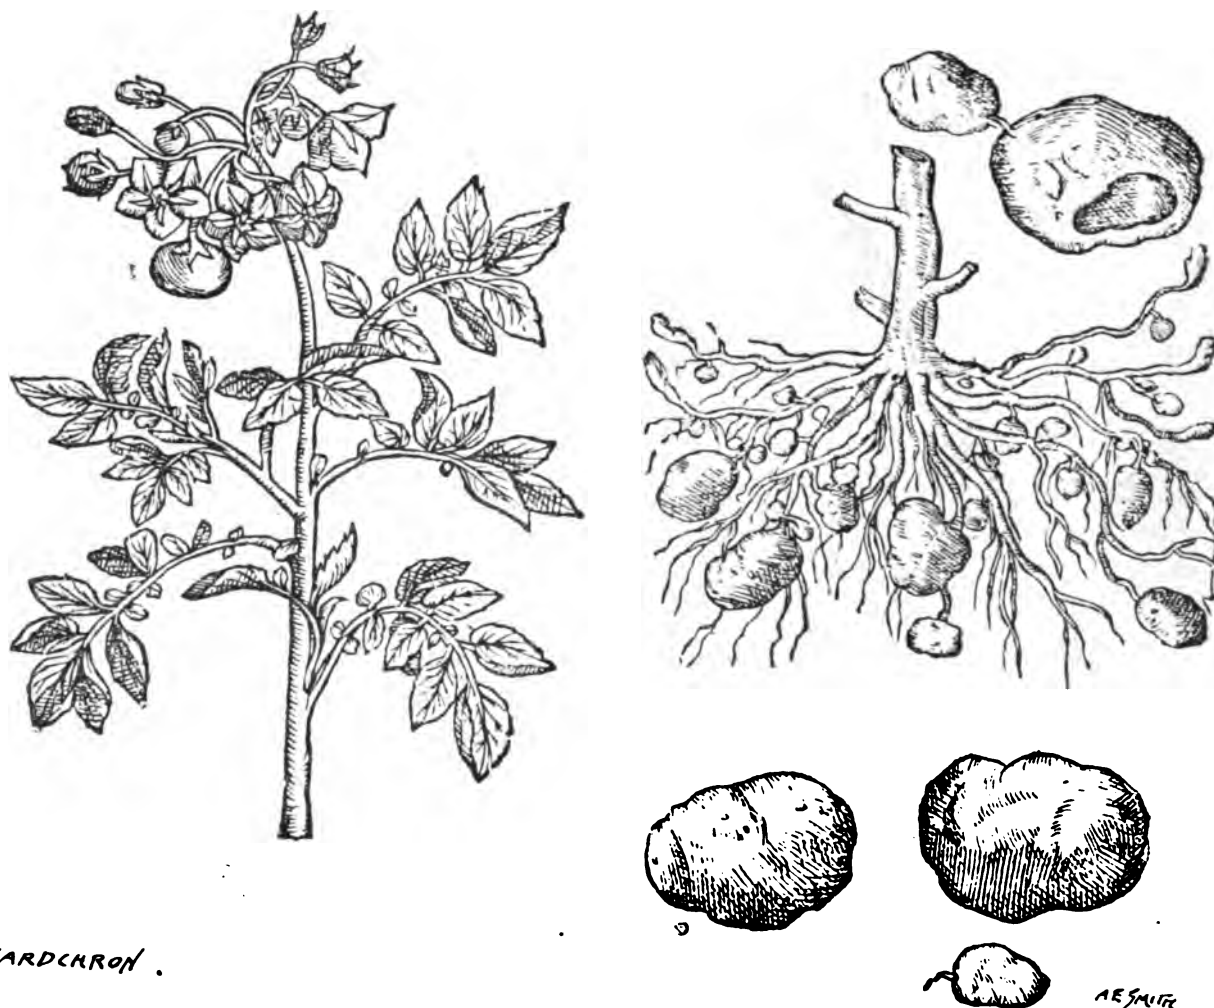

FIG. 52.—"VIRGINIAN POTATOES," FROM THE "HERBALL" . . . OF JOHN GERARDE. . . ENLARGED AND AMENDED BY THOMAS JOHNSON (1636), P. 927. THE FIGURE IS REPEATED FROM CLUNUS' "HISTORIA." (SEE P. 161.)

forestry; in fact, the great density of growth which they show, though in keeping with forests of Spruce, Silver Fir, and Beech, are quite unsuitable, except in the younger or middle-age classes of light-demanding trees, such as Oak, Larch, Scotch Pine, Ash, or Sweet Chestnut, that require to be heavily thinned out when herbage begins to appear beneath them, and then to be under-planted with shade-bearers, so that the soil may still be covered, while the crowns of the overwood are allowed sufficient space to develop and form fine boles beneath them.

Pages 37 to 45 of *The New Forestry* are devoted to a condemnation of the principles inculcated in Brown's *Forester*, but nothing is said about the handsome new edition of that work, published in 1894, with Dr. Nisbet's notes, and which, though of a somewhat patchwork nature, brings the book

General of Forests in India; and the management of these woods is now carried on in the proper way.

I have just returned from a visit to the Scots Pine woods in Windsor Forest, and find that they are being ruthlessly thinned in accordance with Brown's unfortunate system. Surely the opinion of a forestry expert as to the future treatment of these woods might be obtained by Mr. Horner.

While, therefore, agreeing with Mr. Simpson in condemning the open woods that result from Brown's treatment, we should not rush to the other extreme, and plant young trees according to what Mr. Simpson states is the German practice, i.e., several in one hole, the holes being 2 to 4 feet apart. This would involve needless danger from disease, while leading to deplorable waste of money; 4 feet by 4 feet is near enough for most species, although Pines that spread out early into branches

New Forestry cannot be safely accepted as a guide, but there are many points in it which are useful, such as the condemnation of the extravagant veneration for old and useless trees, which encumber so many woods in Britain. Although Windsor Park abounds in such trees, yet old rotting Beech and Oak have been left in a plantation of 1,200 acres in Windsor Forest, and one of these Beech that I measured a few days ago, covers about half an acre of ground, but being hid in the plantation is never seen by anyone but the woodmen. The general idea pervading the book in favour of well-stocked areas instead of the over-thinned open woods so common in Britain is worthy of all praise; and so is the suggestion taken from Schlich's *Manual of Forestry*, vol. ii., p. 112, that the root-system of plants should not be bent over, but given a natural position.

Under the heading of "Forestry Education," I quote the following remarks of Mr. Simpson's, with which I cordially agree:—"As private estates are conducted at present, the only persons worth whose while it is to learn forestry on the higher scale are estate agents, and at present they do not even profess, as a rule, to understand the business, although the woods usually represent a large portion of the value of an estate—and the most interesting portion of it as well. Carelessness on the part of owners, and indifference on the part of agents, correctly describe the state of affairs on most estates at present, so far as general management is concerned." And yet at a recent lecture at the Surveyors' Institution on "Forestry," by Dr. Nisbet, after he, as a Fellow of the Society, had advocated the employment of properly-trained forestry experts to draw up working plans for the guidance of land agents in the management of woodlands, Mr. Watney, the past President of the Institution,

while they would be practically exterminated elsewhere. Working plans, he said, should be drawn up for all private woodlands, and should include the work of the game department; while in opposition to Mr. Watney, who deprecates interference with pheasants and rabbits, and considers rigid adherence to a working plan as bad policy, Mr. Simpson states that "well devised working plans prevent vexatious changes, disputes, and worry; permit work to be carried on without interruption, check irresponsible interference, and leave heads of departments in no doubt as to their duties and responsibilities." I may add here that by ultimately affording a steady instead of an intermittent yield of wood, working plans gain the confidence of timber-merchants, and ultimately increase the financial returns from woods. I regret that I cannot agree with Mr. Simpson in other respects so cordially as I do in the above suggestions. *W. R. Fisher.*

Merit from the Royal Horticultural Society, were much smaller than usual, on account of the long drought experienced here last summer. I have shown specimens of the fruit to good judges at different times, but none of them knew it. Some of them thought it must be a seedling raised long ago, which had never been put into commerce. I have taken specimens of it with me, when judging fruit at Hereford and Bristol shows, and although there were hundreds of varieties exhibited, Gabalva was distinct from any I saw there."

SOME SUSSEX FRUITS.

III.—THE FIG.

(Continued from page 156.)

THE Fig is grown in Sussex either as a wall fruit or as a standard. In many instances, while no attempt is made to train the tree, it is planted in close proximity to a wall which affords it shelter and warmth, though it is allowed to grow freely in all directions. It seems to matter little how it is grown, for the tree is so thoroughly at home that it flourishes everywhere. From Hastings, in the east of the county, to Brighton, Worthing, Tarring, Littlehampton, Chichester, and so on to Gosport in Hants, it is everywhere prolific. Bees and wasps revel in the ripening fruit, so that those who wish to preserve them from insect ravages, enclose them in muslin bags, or place phials near them with syrup, and so lure them to destruction.

The most famous place in Sussex for the Fig-tree is Tarring, a picturesque spot of more than average interest, about 2 miles from Worthing. This interest arises in part from the fact that West Tarring was formerly a "peculiar" of the Archbishop of Canterbury, who is still the patron. Here His Grace had from very early times an episcopal palace, portions of which, dating from the Early English period of architecture, still remain. Thomas à Becket is said to have frequently resided here, and tradition assigns the planting of the Fig-trees to him. If this be not the case, we have indubitable evidence that St. Richard, the famous bishop of Chichester, who held the see so long ago as the middle of the thirteenth century (1245—1253) grafted fruit-trees with his own hands, and worked in the orchard here.

It is, however, generally held, that as the adjoining parish of Sompington, with its splendid old Saxon church, belonged to the Abbey of Fécamp, Fig-trees were first introduced by the monks from that famous place, whose name is even said to mean the Fig-orchard (Fici-Campus, Fécamp). Some prefer to credit the Romans with their introduction. The present orchard is sufficiently remarkable, first on account of the age of the trees still thriving there; and secondly, for its natural history. It was planted in 1745, and contains about 100 trees. Here some 2000 dozen of fruits are gathered in a season of average productiveness. In good seasons they may be seen here and elsewhere lying on the ground neglected, just as Apples are in the Cider-orchards of Somerset and Devon. A goodly sight, in sooth, as Mr. Grindon says, is that of the luscious, blue-black harvest, hanging aloft and around as one walks, as through a bower, below the green roof made by the interlacing boughs.

Here, too, and at Sompington, the naturalist is able to catch glimpses of a visitant which is never seen elsewhere in England. This is the Beccafico, or Fig-eater, a bird which is common enough in the Roman Campagna. It migrates hither year by year as the fruit attains perfection, remains for a month or six weeks, and then disappears.

There are many varieties of Figs, and these have each their peculiarities. Those cultivated in Sussex are chiefly the White Marseilles, the Green Ischia, and the Brown Turkey; but there are also hundreds of trees of a nondescript character, just as there are among Apples and other fruit. The tree thrives under almost any conditions, but flourishes most near the sea, in sheltered spots which are regularly manured and cultivated. "It is upon the extreme

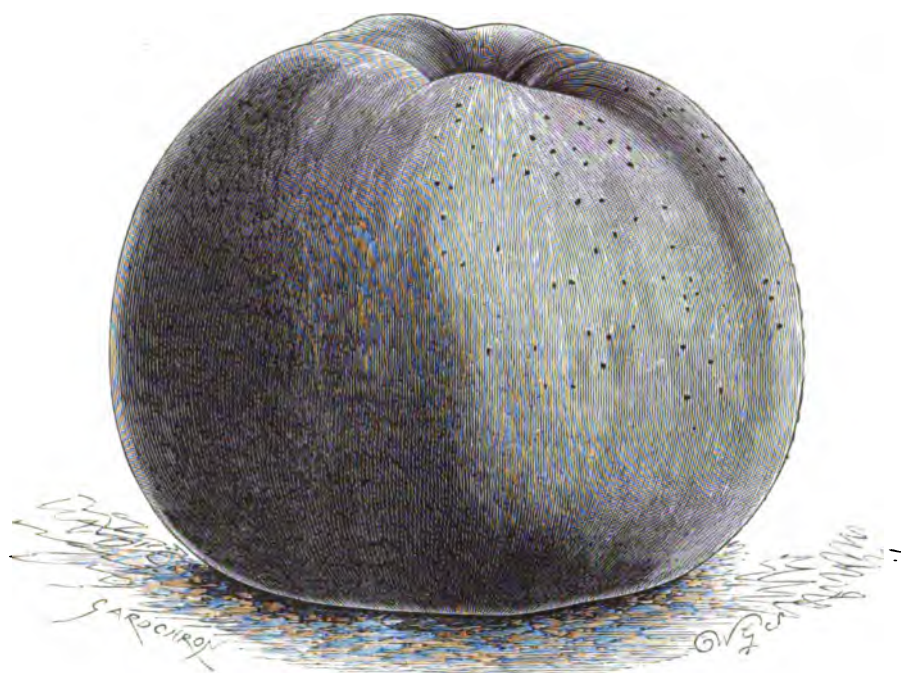

FIG. 53.—APPLE "GABALVA."

could say that he had not much faith in working plans, and that sufficiently good practical foresters could be got at present. What is really required, however, is expert advice to guide the practical foresters. When the Duke of Bedford, the Earl of Selborne, Mr. Munro Ferguson, and the Commissioners of Woods and Forests have thought it advisable to obtain expert advice regarding the management of their forests, it looks as if certain members of the Surveyors' Institution, as represented by their Council, preferred the present happy-go-lucky management of British private woodlands, which they cannot deny, and which they are taking no steps to remedy. It is clear that the landowners themselves must take the initiative, if better results are to be obtained.

Mr. Simpson's remarks, spread over 25 pages, regarding the management of pheasants and rabbits on woodland estates, are extremely valuable, and if his suggestions were accepted by landowners, the contest between the gamekeeper and the forester on so many estates would terminate. Taking them briefly, they consist in putting the game as well as the woods in the hands of the woodman, to whom the gamekeeper would be subordinate; rearing pheasants on an improved plan, and confining the rabbits in a limited part of the estate,

APPLE "GABALVA."

THE Apple illustrated in fig. 53 was brought to notice at the last meeting of the Royal Horticultural Society by Mr. A. Pettigrew, gr. to the Marquis of Bute, Cardiff Castle. In a former issue the initial letter was printed "C." instead of "G." The fruits exhibited were as large as those of Blenheim Orange, deep red upon one side, yellow on the other, and marked upon pale side with numerous dark brown spots. The stalk is set in a very deep and wide cavity, and the eye, which apparently is closed, is also set in a deep basin, which in this case is ribbed. Though the variety is sufficiently good for use as a late dessert fruit, its size will make it a very valuable one for culinary purposes in the early months of the year. The following interesting note has been sent us by Mr. Pettigrew: "We have three standard trees of this variety growing in the grounds here at Gabalva. They are about 35 feet high, with trunks thicker than a man's body, and, to judge from their appearance, they are sixty years old. The tree is a strong grower, a sure bearer, and the fruits which are large, sweet, crisp, and juicy, keep in a good condition till the middle of April. The dish of fruits, which gained an Award of

margin of the island (says Mr. Leo H. Grindon very truthfully) where, bathed by the English Channel, that the Fig is seen, as regards our own country, in its highest perfection. It flourishes where the salt-laden atmosphere renders the culture of other fruits precarious, and where, because of the constant wind-beating, many other kinds of trees are short-lived. This helps to explain the vast abundance of the Fig in the Greek Archipelago, and upon the shores of the adjacent mainlands. Near Gosport (just over the Sussex border) there are Figs with trunks a foot in diameter, and that are probably the oldest ligneous plants in the parish. In the neighbourhood of Worthing there are orchards of Fig-trees grown as standards, all of large dimensions and great age." During the warm days of such an autumn as we last experienced, no fruit could be more acceptable than were the delicious green Figs as they were plucked from the trees at Tarring, Chichester, and other Sussex haunts. *By a Sussex Naturalist.*

(To be continued.)

SOUTH AFRICA.

TACSONIA MILITARIS.

In my opinion there can be no doubt that the plant described and figured in the *Gardeners' Chronicle*, see pp. 464 and 487, last vol., is in fact my *Tacsonia Tidmarshi*, which originated in these gardens some twenty years since, the parents being *T. van Volxemi* ♀ and *T. manicata* ♂, then known to us as *T. ignea*. Plants of *T. Tidmarshi* have been sent to Europe more than once, the last consignment being to the gardens of the late Baron Ferdinand de Rothschild. Particular care was taken in the packing of the plants, and the late Baron wrote to the effect that the consignment reached his gardens in a satisfactory condition. *T. manicata*, when cut or bruised, gives off a strong odour of garlic, and *T. Tidmarshi* shares this peculiarity, but in a much weaker degree than does *T. axoniensis* ×, which we understand was raised from the same parents; thus, to those familiar with *T. manicata* and the two above-named hybrids, it is not surprising, as evidently *T. exoniensis* × partakes strongly of the nature of *T. manicata*, while *T. Tidmarshi* is nearer to the other parent, *T. van Volxemi*. *T. exoniensis* × also shares with *T. manicata* another and an objectionable feature, in being the favourite feeding and breeding ground of a species of moth, the caterpillars of which insect have at length destroyed all the plants of *T. manicata* in this neighbourhood. I should suppose that *T. Tidmarshi* × can only be bloomed in England planted out in lofty conservatories, where its long branches may range at will. The flowers are produced towards the termination of summer, at the ends of the long pendent shoots; and probably, if in early summer some shoots were permitted to escape from the inside to the outside of the roof, and there allowed free growth, flowers would appear in the autumn. The plant, when well sun-baked, is able to resist several degrees of frost.

I should take it as a favour could any reader put me in the way of procuring seeds of the fine rose-coloured *Tacsonia eriantha*, extreme drought having destroyed our plants. *E. Tidmarsh, Curator, Grahamstown Botanic Gardens.* [We cannot find any published reference to *Tacsonia Tidmarshi* ×. It is not mentioned in the new list of cultivated plants published at Kew. ED.]

PLANT PORTRAITS.

DAHLIA MADAME RENE GERARD.—A large flowered, semi-double, flat-petalled variety of the rays rose-coloured, marbled and white, *Moniteur d'Horticulture*, March.

LELIA GOUUDIANA. *Revue de l'Horticulture Belge*, March.

MONARDA DIDYMA. *Revue de l'Horticulture Belge*, March.

ROSE SOLERIL D'OR.—A Rose raised by M. Pernet-Ducher of Lyons, from Antoine Ducher hybrid perpetual, pollinated by Persian Yellow. The result is a very charming hybrid perpetual, with plukish, buff-coloured flowers. *Revue Horticole*, March 1.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Miltonia vexillaria.—Orchid experts hold various opinions regarding the season at which this species should be repotted, some holding that it should be done when the plants have ceased flowering; and others, just as the flower-spikes become visible in the partially-developed growths, new roots then appearing. I have no hesitation in advocating repotting at the present date, when all the conditions favour rapid re-establishment and growth, rather than when the plants are exhausted by flowering. When the drainage is good and the materials healthy and sound, it is merely necessary to pick off a little from the surface and replace it with fresh peat and sphagnum-moss mixed together in equal proportions. Plants whose pots are filled with roots should be repotted, using pots nearly filled with crocks, first removing all the decayed materials and every dead root; some of the compost should then be placed on the crocks, and arrange the plant so that its base is on a level with the rim. Spread out the roots and fill the rest of the space with the materials, care being taken not to press it too firmly. Having finished, apply water with a fine rose-can, which method should be followed as occasion requires till root activity is renewed. On bright mornings let the plants be sprayed overhead. *M. vexillaria* succeeds in a house having a temperature of 60° maximum, and where ample shade and ventilation can be afforded. In order to check the multiplication of Thrips, the house should be fumigated once in three weeks. The varieties *M. v. Klabochorum*, *Leopoldi*, and *superba*, will probably not be in a fit condition to repot just yet, as they flower later in the season.

Miltonia spectabilis and its varieties may now be either repotted or re-surfaced. The plants having creeping rhizomes, a fair amount of space should be allowed for the extension of these; but to obviate the use of large pots or baskets, the plants should be placed on a mound as much as possible, and the rhizomes pegged down to the material as fast as they extend. As copious supplies of water in the season of growth are necessary, a very thin layer of compost should be used, which may consist of two parts of peat to one of sphagnum-moss. A position along with the warm-growing *Cypripediums* should be found for these varieties, the shade and moisture afforded the latter meeting their requirements.

Miltonia candida, with *M. cuneata*, *M. Raguelli*, *M. stellata*, and others of this section, may also be attended to, when the condition of the new growths warrant the appearance of a fresh batch of roots. These may be grown in pots or pans, and subjected to the same kind of treatment as *M. vexillaria*, though a little more warmth is an advantage.

Cycnoches chlorochiton, commonly known as the "Swan Orchid," having rested since the leaves dropped off, has recommenced to grow, and as root-action takes place when the new growths have reached the length of an inch or thereabouts, repotting should be performed at that time. Let all the old crocks and material be removed, cut off the old roots to within an inch or so of the base, and replant in small pans. The latter should be more than half filled with clean crocks, and the compost consist of equal parts of fibry loam, peat, and moss, sprinkling in some fine crocks when working in the compost. Suspend the plants in a light position in the East Indian-house, and afford water sparingly until root-action becomes general, taking care that water does not lodge among the leaves.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Protection against Frost.—Here, in the west midlands, the flower-buds on Peach and Nectarine-trees are swelling fast, and measures have been taken to afford protection to the bloom at short notice. My method is to fix 11-inch and 9-inch boards, according to the height of the wall, under the edge of the coping, securing them to iron brackets. These boards throw off the rain, and thus serve to keep the blossoms dry. Poles of an adequate length are then slightly let into the ground at a distance of 3 feet from the base of wall, their tops being fastened to the edge of the coping-boards. At 2 feet from the ground pegs 9 inches long are fitted into the poles, which support and

hold the blinds securely when the latter are let down. As the garden-walls vary in height, the blinds, which consist chiefly of a mixture of wool and hair called Frigi Domo, are raised and lowered on the higher walls by means of cords and pulleys, and suspended on tenter-hooks fixed on the edge of boards with stout iron rings on the lower parts. On another wall which, owing to its peculiar construction—the whole length of it being a series of curves—coping-boards could be fixed only at great expense, the poles are fastened to the permanent coping, and when the trees come into flower, branches of Yew and Spruce are tied on the poles. This leaves a clear space between the trees and the Fir-branches, which, if lightly disposed, offer but little obstruction to the free passage of light, and a good set invariably results. I mention this to show that it is possible to obtain good results by very simple means. Old fish-nets three-fold or four-fold thick may take the place of blinds, and there is this advantage about their employment, that once they are fixed they give no further trouble. These various methods of affording protection to fruit-blossoms may be equally well applied to Plums, Cherries, and Pears, but if deemed too troublesome, coping boards may alone be fixed on the walls.

Apricots.—The weather has hitherto held the growth of the trees in check, but the flower-buds are ready to burst as soon as warmer weather sets in; still, so long as the present weather conditions prevail there is no necessity to make use of the blinds, but once the flowers unfold they should be drawn or let down over the trees at night. When sharp frosts have occurred on the previous night or in the early morning, the trees should not be uncovered till the sun has warmed the air and dissipated frost.

Figs.—The protective material should now be removed piecemeal from Fig-trees on walls if growth has started, and entirely in the case of trees that are still dormant. The present is the proper season to thin out superfluous and badly ripened shoots and fruitless branches. Let the branches and shoots be secured to the wall, &c., and afford some fresh loam, together with bone-meal and lime-rubble to the border, if the latter is a circumscribed area. Fig-trees with an unlimited root-run seldom or never fruit well in rich kitchen garden soil. In the case of unfruitful trees, a trench should be taken out, 3, 4, or 5 feet from the main stem, according to circumstances, and all roots met with in the process of digging inwards towards the stem, should be cut off to within 2 to 3 feet of the latter. Then instead of returning the soil to the trench, fill the latter with brickbats, clinkers, and old lime-rubble, mixing all together, and ramming the same as firmly as circumstances will permit. If this material be afterwards thrown out annually, the roots will be kept within bounds, and instead of unfruitful growth being produced, there will be short-jointed wood bristling with embryo fruits. Now is the time to plant Fig-trees obtained from the nursery in a dormant condition in pots. An excellent variety for outdoor culture is the Brown Turkey.

THE FLOWER GARDEN.

By J. BENBOW, Gardener to the Earl of Rochester, Abbotbury Castle, Dorset.

The Pruning of Roses.—During March the pruning of Roses in general may be undertaken in most parts of the country. The first to be attended to are climbing Roses; and these, if dealt with as previously advised in these columns, will be provided with strong flowering-shoots; and what the pruner should now do is to cut out all the dead and weakly shoots, cutting them close, and leaving no snags. Having done this, he should cut back the strong shoots to a stout eye or break, taking off from 1 to 3 feet, the weaker ones being the most shortened. The pruning being finished, let each shoot be separately secured, with, if necessary, an inclination slightly downward, then every bud on well-ripened shoots will not fail to flower. Roses which are trained, or allowed to run in orderly confusion over tree-stumps and roots, or rockwork, make a fine display if the shoots are not allowed to become over-crowded, and sunlight is permitted to reach the base of the stem, from which point the strongest flowering growths usually originate. Very strong growers, as for example, *Gloire de Dijon*, *Rêve d'Or*, *Cloth of Gold*, *Reine Marie Henriette*, *Reine Olga de Wurtemberg*, &c., if the plants are grown as hedges, often produce too much flowering-wood,

and in that event the main shoots should be spurred back to a length not exceeding 6 inches. A Rose-hedge thus treated, can be kept neat and orderly looking, and still afford a large quantity of flowers.

Moss, and Hybrid Perpetuals and Tea Roses follow each other in succession of pruning. The proper method of pruning each of these sections is to clear out all superfluous shoots, and those not likely to produce fine blooms, and cut back the stronger shoots to various lengths of from 4 to 8 inches, always cutting to a prominent bud pointing outwards and upwards, so that the resulting shoots may be erect and not tend to crowd together. Amongst Tea Roses, growth and constitution being variable, the knife or *secateur* must be used sparingly in some cases, and resolutely in others, the weaker growers needing the more severe pruning.

Winter Covering.—Remove these coverings when the conditions are favourable, either wholly or in part. Rake level the soil of newly planted beds; and make at the same time each bush firm in the soil by securing it to a wooden stake 2 or 2½ ft. long, passing the hoe frequently between the plants so as to aerate the soil. Newly planted Rose-bushes and standards, if they are well rooted, need not be pruned till after midsummer. These plants usually do not suffer from spring frosts if left unpruned; water should however be afforded, so as to prevent shrivelling.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Preparation of the Soil.—In February, heavy rains and some snowfalls hindered much necessary work in the kitchen garden, thus rendering extra diligence very necessary now that the weather has altered for the better. Plots of ground in which early and second early Potatoes will be grown, should be dug, and thrown into ridges, so as to get it warmed and mellowed. A slight dressing of fresh soot applied before digging will act as a manure, and a deterrent to insects.

Peas.—Where Peas have been raised in pots, as advised in the early part of the month of February, the plants when 3 to 4 inches high should be transplanted to the borders or quarters. The height to which the different varieties attain must be borne in mind when marking out the distance at which the trenches are dug, and this should for the dwarf varieties never be less than 2 ft. In making the trenches, let the land for a width of 1½ ft. be made smooth and level, then lay the line down the middle, and with a bright spade cut a trench 6 inches or less in depth, having an upright back. Having done this, lift the Peas carefully from the pots or troughs, and plant about 6 inches apart, the roots being placed about 1 to 2½ inches below the ground-level, making each plant firm in the soil; then draw a little soil up to the plants, and when they have grown 6 inches high, mould them up finally. Protection may be afforded by sticking small Fir or Laurel twigs in the ground along the lines, 6 inches away from the plants; and if sparrows peck the latter, netting, wire Pea-guards, or white thread with feathers hung thereon, should be placed over the rows.

Forcing-frames.—Carrots and Radishes sown in hot-bed frames should be freely ventilated during mild weather. When seed has been sown thickly, and it has germinated well, see that the plants are thinned before crowding together spoils them. When water is necessary it should be afforded in the forenoon; and about 3 P.M. the plants and the soil should be slightly sprinkled before closing the frames. Turnips require but little heat; and benefit accrues to them from an occasional dusting with wood ashes and fresh soot; and during the hours of sunshine by the removal of the lights.

Seeds.—During March, sowings of Early Short Horn Carrot, Wood's Early Frame Radish, and Early Milan Turnip, may be made on south borders or sheltered plots of ground elsewhere. Before sowing the various seeds, sprinkle wood ashes over the soil, and rake the surface smooth. If the seeds are new and their vegetative qualities are what they should be, sow thinly, but in the case of old seeds or those of low vegetative power, thick sowing is advisable. The drills should be shallow, and the soil made firm over and beneath the seeds.

Best mats should be laid over the beds and kept on them till the seeds have germinated, when netting may take their place.

Lettuce.—Those plants which have been hardened off may be planted on a south border; and in gardens where the wall trees are protected with wide copings, some planting may be done at the foot of the wall. Lettuces Veitch's Perfect Gem, and Golden Queen will, with this kind of protection, and a rich soil soon form solid hearts, succeeding the frame plants. Seed should be sown in warm spots out of doors of Cos and Cabbage varieties. Lettuces growing in frames require to be afforded water freely, and those of advanced growth may have weak liquid-manure afforded by means of a long spouted water-can pushed along the rows without wetting the leaves of the plants; or nitrate of soda may be sprinkled on the soil at the rate of 2 oz. per square yard, and water applied soon afterwards.

Cabbage.—Let the ground between the rows be well hoed, and the plants earthed up. Nitrate of soda or other fertiliser that will cause quick leaf growth, may be sprinkled on the soil.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

Stove Plants.—Cuttings of *Thyracanthus rutilans* may now be taken of a length of 4 to 5 inches, and struck in heat of 68° to 70°, inserting them singly in small pots filled with sandy peat and loam. The cuttings should be put under a *cloche* or handlight, kept moist, and shaded from bright sunshine. When well rooted move them in the course of a fortnight to a slightly lower temperature, then shift them into 6-inch pots, pinching out the points at the same time, and once again in June to induce more branches to break away than would otherwise occur. For the present afford stove treatment, but in summer an intermediate temperature is to be preferred. Equal parts fibrous loam and peat, with sufficient sand to keep the compost porous, suits the needs of this plant. If tall plants are desired, those of last year may be grown on, but for furnishing vases and for table decoration, annually raised plants are best. Brown scale rapidly increases on this plant, and should be kept under by sponging the leaves, branches, &c., with an insecticide.

Eupatorium (*Hebeclinium*) ianthinum succeeds well under similar treatment as regards propagation, &c. During the course of the summer they should be potted into 7 or 8-inch pots, in turfy loam and decayed manure, and the points of the shoots stopped twice early in the season. They are not subject to insect pests.

Gesneras, as they go out of flower, should be moved to warm pits and afforded water until the foliage shows signs of ripening, when it should be gradually withheld, and the pots placed on their sides.

Gloxinias and Begonias previously started in small pots should now require a shift, which it is better to afford before the leaves become fully developed. Let the corms be kept just below the surface, and employ as a potting compost, three parts fibrous loam, and one part dried cow-dung and leaf-mould, and plenty of sharp sand. Thrips are troublesome on Begonias and Gloxinias, but they may be destroyed with the XL-All Compound, using it occasionally. Gloxinias should be afforded plenty of heat and moisture; and tuberous-rooted Begonias a temperature of about 50° at starting.

The Conservatory.—Epacris, Boronias, Acacias, Genistas, and other Cape and Australian hardwooded plants which have ceased to flower, should have the water supply reduced somewhat, and in the course of a week the shoots should be cut back, and the plants removed to a cool house for a time, repotting them when new growth has begun.

Cinerarias, Calceolarias, Pelargoniums, Roses in Pots, &c.—The plants should be fumigated or vaporised about once in three weeks, prevention being better than cure; if plants are neglected, aphids, &c., get established, and it is then difficult to eradicate them without injuring the foliage. Roses should be carefully looked over for caterpillars, for there is nothing better or more effectual than hand-picking. Cleanliness is of more importance to plants under glass than is the material in which they must root. At this season insects, especially mealy-bug and aphides, increase at an enormous rate, and every means should be taken to keep the pests in check.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Peaches and Nectarines.—With but little assistance from sun-heat up to the present time, the fruit in the early houses is not so forward as usual at this season. Any attempt to make up for slow progress by the use of artificial heat must be done with great circumspection, although some varieties stand hard driving with less ill effect than do others. Among the early Peaches which may be called safe ones to be pushed along rapidly are Amsden June and Early Alfred, both good varieties; and among Nectarines Early Rivers, Lord Napier, and Dryden. Where extra high temperatures are really necessary in order to secure ripe fruit at a special date, the forcing should be as much as possible be carried on during daylight, and allowing the temperature to fall to 58° by 10 o'clock at night. Where there is no tendency on the part of the fruit to drop prematurely at this early stage, a gradual thinning should take place, first taking the smaller and worst-placed fruits. A practised eye will generally detect the fruits most likely to swell away and stone satisfactorily. To allow the trees to carry double or treble the amount of fruit over the stoning stage than will be required for a crop is a great mistake. A good crop of Nectarines would be two fruits to every square foot of covered trellis; and for the largest kinds of Peaches one fruit to the square foot will give the most satisfactory results. Simultaneously with the thinning, frequent attention will be necessary to secure and regulate the advancing growths. Let all overcrowding of the shoots carrying fruit be avoided, and if the extension of such shoots is not needed, they should be stopped at the fourth or fifth leaf; then forcing the energy of the shoots into the young fruits below, as will be soon apparent in the rapid swelling of the fruits. Trees which are in full leaf will need a more frequent application of water, and in all cases except in the case of young and vigorous trees, manure-water should be afforded. A cheap and ready means of feeding the trees, and one that suits the Peach, is first to apply a good dressing of soot and lightly fork it into the border, allowing the soot to become damp and then afford water copiously. A dressing of soot will answer for several applications of clear water; and the slight amount of ammonia arising from it is beneficial to the trees.

Succession Houses.—Those with trees in flower will demand daily attention in regard to the setting of the flowers with a soft brush, and on sunny days these houses may be left open an hour or two longer than others in which the fruit is set. Late houses should be kept open day and night during mild weather. In all cases these later houses should not be allowed to suffer for the want of water.

Melons.—The progress that these plants will make will depend upon the steady maintenance of top and bottom-heat, and where this has received proper attention, the buns will now be mounting the trellis. Let all side-growths be pinched to one leaf up to the trellis, and to each alternate leaf after the trellis is reached, thus throwing strength into those shoots that are left; moreover, the foliage will have ample space in which to develop. Where an early set is desired, a few of the strongest plants may be stopped when they have made 1 foot of growth up the trellis, thus inducing them to show fruitful buns. When the fruit appears, reduce to the number per plant to four, and attend carefully to the impregnation of the flowers; and finally, reduce the number of fruits to three on each. When the plants reach this stage, the roots are usually active, and additional compost may be laid on the beds or hillocks. This may consist of sound, not too light, fibrous loam, with a small quantity of bone and blood-manure added, which will stimulate the plants to quicker root action. A house or hotwater-pit may now be prepared for succession, the same directions being carried out as those given for the earliest Melons. A good sweet hot-bed of carefully-prepared dung and leaves should be made up, and well-grown and sturdy plants only should be planted. Those who have to rely on frame-grown fruit, may after this date safely prepare for a crop, by sowing some of the free-fruiting kinds. Among the best for this purpose are Hero of Lockinge and Blenheim Orange. It will be necessary to prepare an ample quantity of dung and leaves for a bed 5 feet deep, and for making up linings.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, MAR. 21 {Torquay and District Gardeners' Association, Exhibition.

THURSDAY, MAR. 22 {Manchester and North of England Orchid Society, Meeting.

SALES.

MONDAY, MAR. 19.—Roses, Fruit trees, Hardy Perennials, &c., at Protheroe & Morris' Rooms.

TUESDAY, MAR. 20.—Final Clearance Sale of the Extensive Nursery Stock, at The Hale Farm Nurseries, Tottenham, by order of Messrs. Thos. S. Ware, Ltd., by Protheroe & Morris, at 11 o'clock.

WEDNESDAY, MAR. 21.—Greenhouse Plants, Lilies, Palm Seeds, Roses, Begonias, Tuberoses, &c., at Protheroe & Morris' Rooms.

FRIDAY, MAR. 23.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—43°4'.

ACTUAL TEMPERATURES.—

LONDON.—March 14 (6 P.M.): Max. 58°; Min. 34°.

Dull—cold—changeable.

PROVINCES.—March 14 (6 P.M.): Max. 47°, S.W. Counties; Min., 45°, N.E. Scotland.

Of late years, as the love for Alpine Gardens, alpine plants has increased, so the desire to cultivate them has extended. The herbarium, all-important as it is, by no means satisfies either the lover of plants for their own sakes, nor the student who wishes to investigate the structure and habits of the plants in question. Just now the study of what is called Ecology, is earnestly pursued. Intelligent observers are not contented with simply observing and admiring—they must know the "reason why." This flower has such a configuration, that one growing perhaps under apparently like conditions, is differently shaped. Some flowers have spots or hairs, or spurs, others have none. What is the meaning of all this diversity? This cannot easily be ascertained in the herbarium. In general terms it may be said that these peculiarities are or were originally the consequences of a response to the influence of external conditions, or that they are in some way connected with insect visitations and the distribution of the pollen. Sometimes they are of an aggressive nature, bidding defiance to marauders; at other times they are mere passive protectors. This class of facts relating to the adaptation of form and structure to circumstances is comprised under the general term Ecology.

It is a fascinating study, and it necessitates the investigation of the plants as they grow. Students, now, are dependent on the resources of a garden to a degree that was not dreamt of a few years ago. Among these gardens the alpine gardens established in various mountain districts in Switzerland, Italy, Austria, &c., are specially valuable for the purposes we have alluded to. They are placed at various levels—one lately mentioned by us at the Rocher de Naye is at an elevation of 7,000 feet—that at

Zermatt, for instance, is in the village at the foot of the mountains. The plants are grown on raised beds, divided into compartments and pockets, and irrigated by means of a perforated pipe carried along the ridges of the rocks. This garden contains a collection of the wild plants of the neighbouring mountains and valleys, which is very serviceable, if for no other reason that it affords the botanical tourist, not overburdened on his journey with books of reference, to name with facility the plants he has gathered on the mountain slopes.

Such gardens, if not carefully looked after, soon lose their value and become tangled masses of nameless vegetation, pretty enough sometimes, but useless for all purposes of research; whilst the labels soon assume the confused condition known to printers as "pye." Such wildernesses may be seen in the vicinity of some of the large Swiss hotels, when the zeal with which they were started has cooled down. This circumstance shows the necessity of placing such gardens under constant intelligent supervision during the season; in winter, of course, they must be left untended.

The garden known as Linnaea, at Bourg St. Pierre, in the Valais, is the best known of these gardens. We give a view of one of the many rock-beds in our Supplementary Illustration. It is maintained under the auspices of a society instituted for the purpose, and is under the direction of M. CORREVON. There are special rockeries devoted to Ferns, Sempervivums, Primulas, &c., and in others the floras of the Alps, the Pyrenees, the Cevennes, the Caucasus, and even of extra European mountain districts, like the Himalayas and the Andes, and the mountains of Tasmania, are illustrated by examples.

It is proposed to increase the utility of the garden by the erection of a workroom—laboratory is too grand a name—where microscopes and botanical appliances for the use of students may be found. The Linnaea is reached from Martigny in five to six hours, following the route to the great St. Bernard. It is placed at a height of 1,700 mètres. Plantations or natural groups of Larches and Pinus Cembra afford shelter, and add to the picturesqueness of the scene.

It is evident that a garden so placed and conducted on comprehensive principles will be of great value to horticulturists and to botanists. The expenses of the establishment are very small, and the number of subscribers much less than the importance of the establishment demands.

The Royal Horticultural Society.

ANOTHER week has past, and we are still without any authentic information as to the new programme of the Royal Horticultural Society. There may be good reasons for this reticence, but if so, there is the greater cause for not accepting the result of the annual meeting as final. It does not require much thought to arrive at the conclusion that proposals of such magnitude must necessarily occupy much time for their due consideration, and that the consequent negotiations must also be time-absorbing. The Council will doubtless feel it incumbent on them to take the Fellows into their confidence, and not take the approval of the annual report as a mandate to carry out works of such magnitude and importance without the express sanction of the Fellows.

It is natural enough that the Centenary of the Society should be duly commemorated, and four years is not too long in advance for some of the proposals that have been made. The

formation of a new garden at a distance from London is one proposal, and this is strengthened by the circumstance that the lease of Chiswick has only a few years to run—how many we do not exactly know. In these circumstances the Council has to consider whether they will dispense with a garden in future, or whether they will procure one in another situation. They have decided in principle that they will obtain a new trial-ground, and in so far, but no further, as we take it, they have received the mandate of the Fellows. The Fellows present at the annual meeting could never have had the idea of pledging the Society generally to the details of this, or indeed of any other scheme, particulars of which were, probably of necessity, not laid before them. It is not possible to form any adequate idea of schemes that may be unexceptionable, but which are still mainly visionary. We can only wait for fuller knowledge; but in the meantime we must take exception to the notion which seems to be adopted by some, that the Fellows are pledged by the results of the annual meeting. The proper course is for the Council to mention what suggestions they have received, and to formulate the proposal they consider best, and when they are ready to do so, lay it in detail before the Fellows and act in accordance with their finding.

THE authorities of the Royal Plant Names. Gardens, Kew, have conferred

an immense boon on horticulturists by the preparation and publication of a list of garden names of plants introduced between 1876 and 1896.* The list published in our own columns, including the period from 1841 to 1878 was published in detached fragments at irregular intervals, and was avowedly a select list only, of which but a few completed sets were issued. Nevertheless, it may now be said that with its aid we have a fairly complete list from 1841 almost to the present time of the most important plants, besides the numerous scattered lists given from time to time in these columns and in those of our contemporaries.

A similar more or less complete publication has been made in the *Journal of Botany*, in the *Gardeners' Year-Book*, and in other periodicals of like nature, and continued for some years; while the *Kew Bulletin* has latterly contained similar and more complete enumerations. The *Index Bibliographique* of MOREEN and DE VOS contains a complete list of plants described, figured, or introduced into Belgium from 1830 to 1880. The same plants, we may presume, found their way to this country. The catalogues of the gardens of Commander HANBURY of La Mortola, of M. BARBEY of Vallorbe, and of M. MICHEL of Geneva, may also be mentioned in this connection as useful lists of garden plants. To have these names brought together in a single volume is an enormous advantage, for which, as we have said, horticulturists owe a debt of gratitude to the authorities of the Royal Gardens. It is a large step towards the publication of a *Hortus Europæus*, in which the validity of the names could be established, and incorrect or provisional names eliminated.

The book before us is, however, professedly only a list of names. Many of these are mere garden-names applied by the introducers or the raisers without a thought of their botanical correctness or otherwise. Their "provisional" character is in many cases inevitable, as no means

* List of Published Names of Plants introduced to Cultivation 1876-1899 (*Kew Bulletin*, Additional, Series IV.) (Eyre & Spottiswoode. Price 4s.)

may exist at the time of introduction for the exact determination of particular subjects. Names thus given without botanical authorisation should always have the abbreviation "hort." affixed to them, to avoid confusion. It would be still better to avoid the use of Latin names altogether for such plants till their status is ascertained. On the other hand, where the plant has been botanically described or figured by some competent authority, the name of that authority should be given. Take, for instance, the scores of species described in these columns by REICHENBACH and other botanists, the names are mentioned, and the references are cited, but there is no indication in the Kew list to show that these are not merely garden names, but duly registered plants, such as a monographer would be bound to quote. As the reference is invariably given this is not a matter of great importance, as it only involves the necessity of turning up the reference, when the name and its author will be found.

In the *Index Kewensis* many merely provisional or catalogue names, published without botanical examination, and the descriptions of which were not cast in botanical form, are assigned to their presumed authors in spite of their being unsigned. In this way, species are attributed to individuals who in many cases, perhaps most, had nothing to do with the plants, and had not even seen them. While speaking of the monumental *Index Kewensis*, it may be mentioned that, although some garden names are inserted in that work, a very large number were excluded, because they lacked botanical significance. The record of these names, unless we are mistaken, is still preserved at Kew, and it would have added to the value of the present publication had they been inserted in it. As many of them must be identical with those now published, and would not require to be repeated, the additional bulk would not have been excessive.

The present volume goes far to supply what we have longed for—a complete list of cultivated plants, adapted for the use not so much of professed botanists, as for working horticulturists.

The number of names entered amounts to 7600; the actually new plants have been derived chiefly from Colombia, Malaya, and the Polynesian islands. It contains, it should be said, not only the names, but brief descriptions of the plants.

The orders most largely represented are Orchidaceæ, Liliaceæ, and Araceæ—an indication of the taste of the day in matters horticultural. We cite some additional figures, which further illustrate the trend of modern plant-collecting. Of *Odontoglossum* there are about 350 entries, and of other genera the numbers are as follows:—*Cypripedium*, 350; *Cattleya*, 250; *Dendrobium*, 220; *Lælia*, 160; *Masdevallia*, 150; *Oncidium*, 120; *Croton* and *Iris*, each 100. These numbers include not only recognised species, but hybrids and cross-breeds. As an illustration of the manner in which the book has been compiled, we add the reference relating to—

"*BERBERIS THUNBERGI* (B. M., t. 6646), H. [hardy].—A species of dwarf bushy habit; spines, simple; L. [leaves], tufted, $\frac{1}{2}$ –1 in. long, spatulate obovate entire; Fl., solitary pendulous; pale yellow, tinged with red. Japan."

To make this complete, the name of the author and the date of publication should have been added. But the illustration will confirm our statement that this book is of the utmost value to horticulturists, and a great aid to botanists.

LINNEAN SOCIETY.—A meeting of this society was held on Thursday last, March 15, at 8 P.M., when the following papers were read:—Mr. W. B. HEMSLEY, F.R.S., F.L.S., and others: "Report on the Botanical Results of an Expedition to Mount Roraima in British Guiana, undertaken in 1898 by Messrs. F. V. McCONNELL and J. J. QUELOH." Mr. A. W. WATERS, F.L.S.: "Bryozoa from Franz-Josef Land, collected by the Jackson-Harmsworth Expedition, 1896–97." Exhibition—Professor J. B. FARMER, M.A., F.L.S.: *Lantern-slides of Flowers*. (Postponed from last meeting.)

ROSE SHOW FIXTURES IN 1900.—Mr. EDWD. MAWLEY, Rosebank, Berkhamsted, Herts, has kindly furnished the following dates of Rose shows to be held in the current year:—June 27 (Wednesday), Salisbury (N.R.S.), and Richmond, Surrey (two days); June 28 (Thursday), Canterbury; June 30 (Saturday), Windsor. July 3 (Tuesday), Gloucester, Harrow, and Sutton; July 4 (Wednesday), Croydon, Hereford, and Reigate; July 5 (Thursday), Bath and Norwich; July 7 (Saturday), Crystal Palace (N.R.S.); July 10 (Tuesday), Wolverhampton (three days); July 12 (Thursday), Brentwood, Eltham, and Salterhebble; July 18 (Wednesday), Cardiff (two days); July 19 (Thursday), Birmingham (N.R.S.), and Helensburgh; July 24 (Tuesday), Tibshelf. Mr. MAWLEY will be glad to receive the dates of any other Rose shows (or horticultural exhibitions in which Roses form a leading feature) for the next list of Rose show fixtures which will appear early in April.

DAHLIA SHOW AT THE ROYAL AQUARIUM.—An exhibition of Dahlias on much the lines of that held last summer will take place at the Royal Aquarium on September 18 and two following days. A sum of nearly £30 is offered in prizes, a portion of which has been subscribed by the Directors of the Royal Aquarium, and the remainder by private subscription. Two main objects are sought by the establishment of this show: one is to provide an exhibition of Dahlias in central London, the other to afford a convenient opportunity for a further exhibition of seedling Dahlias. The Aquarium show will be supplemental to, and not in any way antagonistic to the exhibition of the National Dahlia Society at the Crystal Palace on September 7, as all the donors to the prize fund are members of the National Dahlia Society. Schedules of prizes can be obtained of the superintendent, Mr. RICHARD DEAN, 42, Ranelagh Road, Ealing, W.

THE SHROPSHIRE HORTICULTURAL SOCIETY.—We have received a schedule of the prizes to be offered at Shrewsbury by this Society during the present year. The first show will be held on April 4, and although this event is chiefly of local interest, there will be thirty-eight classes for plants and flowers. The great summer show, as we have already announced, has been fixed for August 22 and 23. The prizes to be offered then are of the usual liberal character, and amount to about £1000. We do not discover any important alterations in the classes for plants, or those for cut flowers. There will be two large group classes, the 1st prize for each of which will be £25. An equal sum is offered as 1st prize for an exhibit of twenty stove and greenhouse plants, and £20 for an exhibit of thirty stove or greenhouse plants (Orchids excluded) in pots not exceeding 10 inches. The classes for cut flowers are very numerous, and include one for an exhibit of bouquets on a space of 10 ft. by 5 ft., for which prizes are offered of £15, £12 10s., and £10. In the fruit section, in place of the Champion Grape class of last year, there is to a Champion Fruit Class. The exhibits are to consist of twenty-four dishes of British-grown fruit, and each exhibit will be given a space of 10 feet by 4 feet 6 inches. Pines, Currants, Gooseberries, Raspberries, Strawberries, and Bananas, are not invited, but we suppose, with the exception of Pines, may be shown at the discretion of the

exhibitor. The maximum points to be awarded for Grapes, Melons, Peaches, Nectarines, Pears, Apples, Figs, Apricots, Plums and Cherries, are published in the schedule. Each collection of fruit must be decorated with non-flowering plants, loose foliage, or cut flowers, but the quality or otherwise of the decorations will not influence in any degree the awards of prizes for fruit. The fruit prizes, which are £25, £20, £15, and £10, will very properly be awarded to the collections that show highest cultural merit. But there are three extra prizes of £3, £2, and £1, which will be gained by the decorations exclusively. Thus there are two competitions in the one class. The same arrangement has been made in the cases for smaller collections of fruit—twelve dishes, and nine dishes. All collections have now to be decorated, but the fruit in every case will be judged on its own merits only. This appears to be a very satisfactory way of settling the question. It will secure that exhibits of fruit will be displayed in such a manner as may be expected to please visitors, and at the same time will prevent the award of prizes that have been offered for the finest fruit to a collection of second best fruits because they are faultlessly staged. The class for a table of fruits arranged for dessert will be continued on the same principle as last year. The classes for vegetables include special prizes from most of the large seedsmen, in addition to those given by the Society. Independently of the cottager's section, this interesting schedule includes 199 classes. The Hon. Secs. are Messrs. ADRIATT & NAUNTON, The Square, Shrewsbury.

TOWN PLANTING IN GERMANY AND HOLLAND.—In *La Semaine Horticole* is quoted a list of the sums granted by the public bodies in 1898, for furnishing parks and plantations in Germany. These figures show the progress of horticulture in the country. The amounts in marks or shillings are as follows:—Berlin, 302,582; Hamburg, 179,000; Breslau, 169,600; Cologne, 107,497; Magdeburg, 96,500; Munich, 84,300; Frankfurt, 79,380; Leipzig, 73,622; Dresden, 61,200; and Hanover, 59,150 marks. This amounts to a sum reckoned in pfenniges (a pfennig is worth less than half a farthing) per inhabitant of:—for Breslau, 46; Magdeburg, 45; Frankfurt, 35; Cologne, 33; Hamburg, 29; Hanover, 28; Munich, 21; Dresden, Leipzig, and Berlin, eighteen pfennigs for each city. In the cities of Holland the expenditure the same year was as follows in florins (1s. 8d.):—Amsterdam, 60,750; The Hague, 37,400; Rotterdam, 30,900; Utrecht, 21,275; Arnhem, 13,000; Nimeguen, 12,952; Groningen, 12,040; Haarlem, 10,660 florins; making a sum, for each individual, of:—for Amsterdam, 12 cents; The Hague, 19; Rotterdam, 10; Utrecht, 22; Arnhem, 23; Nimeguen, 31; Groningen, 18; and Haarlem sixteen cents.

FRUIT FROM THE CAPE.—Since our last report, the steamships *Dunottar Castle* and *Moor*, of the Castle and Union Lines, have arrived from the Cape, the former bringing 621 boxes of Plums, 176 of Peaches, 190 of Grapes, 37 of Nectarines, and 34 of Pears: total, 1054 boxes. Of Plums, most were sold privately at Covent Garden. The fruit was in good condition, but prices were low, owing to large arrivals; fine qualities realised 8s. to 9s. per box. Of Peaches, mostly in good condition, although the quality varied very much, the best realising 14s. per box. Grapes were in good condition, and sold quickly at fair prices; the best prices were 18s. per box. Nectarines were large and good-looking, but not thoroughly ripe; fair prices were obtained for them. Pears were in good condition, but not fine enough fruit to obtain the top prices. There is a good market for large and ripe Pears. The *Moor* brought 497 boxes of Plums, 181 of Peaches, 280 of Grapes, 143 of Pears, and 11 of Nectarines—total, 1112 boxes. Plums were an over-supply, and cannot be considered the same sort of table luxury as Peaches or Nectarines, and are not sought after by west-end houses so much as Grapes are. Those put on the market were in good condition; a few boxes of

the very best Kelsey Plums fetched 9s. a box; others sold at low prices. Peaches were in good condition, and fetched moderate prices. Grapes were in fair condition, 19s. a box being obtained for the best—mostly the variety Hermitage. The Pears were in good condition, quite ripe, but rather small; the best fetched 8s. per box. Nectarines were in fair condition, and quickly sold at good prices; 14s. per box for the best. The whole of the fruit seems to have been carried by the steamers in capital condition, and the merchants here seem well satisfied.

STOCK-TAKING: FEBRUARY.—The national stock-taking having just been closed, the balance-sheet drawn up and passed, we may briefly refer to what is the basis of the account for very much of all yearly stock-taking—the "Trade and Navigation Returns," and now relating to the encouraging figures for the past month. Astonishing as these are, we can but hope considering our liabilities, that they but prelude greater records in the months to follow. The imports for last month foot up at £37,604,808, against £35,589,109—an increase of £2,065,699. The following are our usual extracts from the "summary" table:—

IMPORTS.	1899.	1900.	Difference.
	£	£	£
Total value ...	35,589,109	37,604,808	+2,065,699
(A.) Articles of food and drink—duty free ...	11,015,431	11,061,019	—89,412
(B.) Articles of food & drink—dutiable	1,821,205	2,014,282	+193,077
Raw materials for textile manufactures ...	6,228,434	7,810,065	+1,582,531
Raw materials for sundry industries and manufactures	2,026,154	3,556,351	+1,530,197
(A.) Miscellaneous articles ...	1,312,992	1,303,107	—9,885
(B.) Parcel Post ...	95,027	89,892	—5,635

At this season of the year the returns relating to fruits, roots, and vegetables are of more than usual interest—the figures and values for the past month are as follows:—

IMPORTS.	1899.	1900.	Difference.
	Bushels.	Cwt.	Value.
Fruits, raw:—			£.
Apples ...	308,225	169,729	—4,317
Apricots and Peaches	56	+277
Bananas... bunches	89,400	+88,500
Grapes ...	1,859	637	—1,099
Lemons ...	75,748	109,045	+20,172
Nuts—Almonds (cwt.)	5,005	6,232	+5,172
" others, used as fruit (value)	£18,327	—5,770
Oranges ...	1,272,695	778,738	—11,492
Pears ...	2,808	1,192	—25
Plums ...	439	158	—294
Unenumerated... ..	59,636	4,681	—19,238
Vegetables, raw:—			
Onions ... bush.	569,654	619,005	—8,567
Potatoes ... cwt.	62,787	328,268	+40,945
Tomatoes	38,420	+34,897
Vegetables, raw, unenumerated... .. value	£92,753	£33,748	—59,010

We may add, that California promises to compete for the supply of high-class Asparagus for the English market; it has a long way to travel, but they have done some good work in the way of transporting tender fruit by the aid of the cool chamber. The value of the imports for the past two months we may add is £82,160,722, against £76,755,715—or an increase of £5,405,007—truly, a step forward. Coming now to the—

EXPORTS.

we find a still more satisfactory record. The total for the month is £23,219,849, against £19,382,406 for February, 1899—an increase of £3,837,443. The increase is distributed over all the sections.

Altogether, the export division of trade shows a most healthy condition of things. The figures for the past two months foot up at £46,803,531, as against £39,729,640 in 1899—an increase of £7,073,891.

TREE PLANTING-IN ON CROWN LANDS IN WALES.—Her Majesty's Commissioners for Woods and Forests have again placed their order for extending their plantation on Crown Property, Wales, in the hands of Messrs. WM. CLIBRAN & SON, under the superintendence of Mr. LEWIS, of Arthog.

PLANTS FOR STUDY.—According to *Nature* for March 1, 1900, Messrs. JAMES BACKHOUSE & SON, Ltd., of York, have inaugurated a new department in their nurseries, which may be of great service to botanical lecturers and demonstrators, in providing a supply of material especially for microscopic work. They have issued an extensive priced catalogue, comprising objects in the Myxomycetes, Algæ (including diatoms), Characeæ, Fungi, Hepaticæ, Musci, Pteridophyta (prothallia and vegetative organs), Gymnosperms, and all the more important orders of Angiosperms. The

FIG. 54.—IRIS DANFORDIÆ.

department is under the management of an experienced practical botanist, Dr. ARTHUR H. BURTT, and seems likely to supply a long-felt want. Considering the lack of knowledge of plants, and their relationship one to the other, which is characteristic of the times, it would be well if Messrs. BACKHOUSE would increase the supply during the season of illustrations of the principal natural orders; these would be of great value to medical students and to young gardeners.

THE LATE JOHN FRASER, of Lea Bridge Nurseries, who was one of the founders of the United Horticultural Provident and Benefit Society, was also its first treasurer. At the annual meeting of the society (see p. 175) the following motion was adopted unanimously on the proposition of another of the society's first supporters, Mr. W. MARSHALL, Chairman of the Floral Committee of the Royal Horticultural Society: "That the members . . . at their annual meeting . . . desire to record their appreciation of the inestimable services rendered to the fund by the late Mr. JOHN FRASER as first Treasurer on the formation of the Society, and hereby tender their sincere condolences to his family for the irreparable loss they have sustained."

IRIS DANFORDIÆ AND I. STENO-PHYLLA.

THESE are two species of bulbous Iris allied to *I. reticulata* and *persica*, of which one is quite new and of the other a good supply of bulbs has now been brought to this country for the first time. They were both exhibited in flower by Mr. Wallace, of Colchester, at the last show of the Royal Horticultural Society.

I. Danfordiæ (fig. 54) was discovered by Mrs. Danford on the Cilician Taurus in the spring of 1876, growing not far from the melting snow at a height of 6000 feet above sea-level, and it has since been collected by Bornmüller in Amasia. The leaves are very narrow, short at the time of flowering, but as in *I. reticulata*, growing out to a considerable length after the flower fades. The flower springs from the surface of the ground, and has a long slender tube. The limb is about 1½ in. long; the inner segments are entirely suppressed, and the outer have a long claw and a small reflexing orbicular, yellow blade, with spots of black at the base, extending down the claw. The style-branches are also yellow with large crests, which reach to the tip of the perianth segments. It has been called *I. Bornmülleri* by Hausknecht, and *I. amasiana* by Bornmüller. It was figured at tab. 7410 of the *Botanical Magazine* from plants in the Royal Gardens, Kew, in 1890.

Iris stenophylla (fig. 55, p. 171), which was discovered by Siehe in the Cilician Taurus in 1895-6, has never been previously figured or described so far as we are aware. The name *stenophylla* was given to it by Hausknecht, and it has also been called *I. Heldreichi*. It has a tuft of five or six linear leaves deeply channelled down the face, short and stiffly erect at the flowering season. The flower springs from the surface of the ground, and the long tube is lightly wrapped round by the imbricated, lanceolate spathe-valves; the outer segments of the perianth are a couple of inches long, with a reflexing blade about as long as the claw, blackish-blue towards the tip, and with many black spots on a pale ground below it. The inner segments are small, and spread horizontally. The style-branches are lilac, with very large crests, which reach nearly to the tip of the perianth. Its nearest alliance is with *I. persica*. A coloured figure and full description will appear shortly in the *Botanical Magazine*. J. G. Baker.

THE WEATHER IN WEST HERTS.

THE weather remained with scarcely any alteration as regards temperature until the 9th, but since then, although the night readings have changed but little, the days have been decidedly warmer. On the coldest night the exposed thermometer showed only 6° of frost. Both at 1 foot, and 2 feet deep the soil is now about 1° warmer than is seasonable. No rain at all has fallen for nearly ten days. The winds have been very light, and entirely from some northerly or easterly point of the compass. The average rate of movement of the air at 30 feet above the ground during the seven days ending the 8th, was less than two miles an hour, and in no hour rose to eight miles. The same seven days were also extremely gloomy, as the sun shone for only three hours altogether during that week. The first *Chionodoxa Luciliæ* came into flower in the spot under observation in my garden on the 12th, which is four days later than its average date in the previous twelve years, and later than in any of those years since 1895. E. M., Berkhamsted, March 13.

CULTURAL MEMORANDA.

CALADIUMS.

THOSE tubers which have been kept dry in a warm house, should be shook out and repotted in small pots, to be again repotted later on. Afford water sparingly till roots form, and place the pots

in a moist stove or Melon-house, dewing them twice daily with a fine-rose water-pot. When the leaves begin to form afford full light, and shading thinly when the sun is very bright. The first potting may be with a light, sandy soil, but at the second one turfy-loam in a rough state, a small quantity of dried cow-dung or rotten manure, together with a few small lumps of charcoal, and plenty of sharp sand should be used. Peat too may be added to the compost with good results. Although the tubers will winter well in the pots in which they grew, I prefer to shake them out when the foliage is dead, and layer them in large pots with dry sand, the

GLORIOSA SUPERBA.

These bulbs should now have the exhausted soil shaken from them and be repotted, and then placed in a moist stove. The best sort of soil for the plants is a light porous loam and fibrous peat, not too finely broken up, in equal proportions, and some charcoal and road-grit; the pots should be well drained. From three to five strong bulbs may be placed in 12 to 14-inch pots after three-parts filling the pots; this will give ample room for a top-dressing when some amount of growth has been made. Not much water should be afforded till the pots begin to fill with roots, and

after having been out over, if the pots are plunged in a little bottom-heat, the plants soon begin to grow again, and are more satisfactory than new seedlings. Cultivated in pots, Sweet Basil succeeds better than when grown in boxes, as it is not so liable to damp off, and can be more conveniently brought near to the light. H. H. T.

RAINFALL AT BELVOIR CASTLE, LEICESTER, AND BELVEDERE HOUSE, WEST MEATH.

I ENCLOSE you two readings of the rain-gauge in order that the readers of the *Gardeners' Chronicle* may compare them, one at Belvoir Castle, and the other at Belvedere House, Westmeath, Ireland. Belvoir is on the clay in a position very similar to my own position, on the Central Limestone Plain of Ireland. The curious point is, that while my rainfall is 15 inches more than that at Belvoir, the number of days in which rain fell was only six more in Ireland. There is, however, considerable difference in the character of the vegetation in the two places. Mine is more luxuriant, although I am 100 feet higher above sea level. But I cannot ripen fruit as it is done at Belvoir. Primroses cover my park in the spring, and they grow very sparingly at Belvoir Castle; while many tender plants, which succeed in Leicestershire, I cannot manage, although my climate is supposed to be a milder one. The fact is, gardeners do not pay sufficient attention to the atmospheric conditions surrounding them. A few miles may make all the difference in the world. The habit of classing plants in catalogues as "hardy and tender" is most delusive, so called hardy plants will fail when so called tender ones will succeed. Successful gardening requires the most careful examination of soil, position, and prevailing winds; and if plants come from another land, an accurate knowledge of the conditions under which they grow in a state of nature. O. Brinsley Marlay, St. Katherine's Lodge, Regents Park, N.W.

Rainfall in 1899 at Belvoir Castle (Garden), county of Leicester:—Rain-gauge: diameter of funnel, 8 inches; height of top above ground, 1 foot; above sea-level, 260 feet.

Month.	Total depth.	Greatest fall in 24 hours.		Number of Days on which '01 or more fell.

JAMES BAYLESS

FIG. 55.—IRIS STENOPHYLLA. (SEE P. 170.)

pots taking up but little room, and they may be stood out of the way in a house having a temperature that does not fall below 60°.

GARDENIAS.

Cuttings struck and potted early in the month of January will now require repotting, and to be placed in a brisk moist heat. The plants should not be checked in their growth, as they are long in making a fresh start. Young plants should be encouraged to make strong, robust growth, applying water liberally when the soil is getting dry, and affording artificial manure and clear soot-water in small doses at weekly intervals. The points of the leading shoots should be stopped twice, if this be done more often the flowers come small. The best kind of soil for the plants is roughish peat and fibrous-loam, with small lumps of charcoal and plenty of sharp sand; pot firmly, and leave ample space for affording water.

afterwards water may be freely applied, and at intervals clear soot-water, liquid-manure, or some kind of artificial manure; train the shoot to a trellis placed near the roof-glass. H. Markham. Wrotham Park, Barnet.

SWEET BASIL.

This herb, *Ocimum basilicum*, whose aromatic leaves is used as a flavouring for soups, &c., though not difficult to grow, is costly to purchase, and not easy to obtain. If by chance the gardener should fail to meet the demand for it, a good method of culture is to prepare about sixty 6-inch pots in September, and prick off into each of these a dozen or so of seedlings taken from the seed-pans. These become well established before the winter sets in—an important point, for late seedlings will not develop into satisfactory plants. Placed in a light, warm house, on a shelf near to the glass, they grow strong, and remain sturdy. When this is the case,

HOME CORRESPONDENCE.

AN EASY METHOD OF APPLYING SULPHUR TO PLANTS.—Procure some sulphur wicks, such as are used by coopers for purifying barrels and vats; there are larger and smaller sizes of them. Put the wick in a cleft stick, light it, and walk through the glasshouse. A person walking fast will ensure a light fumigation; slower walking, or a second round will afford a stronger fumigation. Whilst doing this, the wick will let fall small drops of burning sulphur, but these are very small, and have never been found to hurt growth on Vines, Peaches, Tomatoes, Carnations, Roses, Callas, Smilax, or Asparagus. Of course, just as for everything else, a trial on a limited space should be made when first experimenting. Up to the present time we have not used it on Vines with berries just set, these being very sensitive to sulphur-fumes in general. Of course, heavier doses than a man can endure cannot be applied, but the process is so easy, so quickly applied, that it can be repeated as often as may be desirable. We have done it twice a day. Be careful to light and to blow out the wick outside of the glasshouse. *Heleneveldt.*

THE ELM-BARK BEETLE.—I notice in the *Gardeners' Chronicle* of February 24, some remarks regarding this beetle (*Scolytus destructor*), made at the meeting of the Royal Horticultural Society's Scientific Committee, on February 13, by Mr. McLachlan. Having made this beetle a special study for several years, I can confidently assert that it never attacks trees which have the least vestige of vigour about them, and that, as Mr. McLachlan believes, it is rather a scavenger than an enemy to standing timber. I have frequently noticed Elms which have had a portion of the bark of their trunks or large branches destroyed by lightning or other causes, and on such portions the beetle will breed, but always ceases to bore into the adjoining healthy bark. It is true that the bark must be still fresh to receive attention from the mother beetle, and there are plenty of instances of living trees being attacked, but I have never seen or heard of a case of healthy specimens being injured by it. One of the principal reasons for this is the fact that at the time the mother galleries are commenced (May), a boring made in the bark of a healthy tree is at once filled with sap, and the work of the beetle put a stop to. *A. O. Forbes, Calne, Wilts.*

PROTECTING PEACH BLOOM.—Although I hesitate to differ from so eminent an authority as "D. T. F.," I am glad to see that he agrees with me upon some points, while differing upon others. The plan which I adopt relates only to the Peach and Nectarine. Peaches, Plums, and Cherries, are usually on the more shady side of the wall; and the young wood of the Pear, as everyone knows, unless wanted for extension, is removed at the winter pruning, and the trees are not so liable to be hurried into flower as the Peach, Nectarine, &c., which are, or should be, on the warmest aspect. If Peaches and Nectarines could be planted where Pears, &c., flourish, the need of keeping cool or of protection would not arise, because their sunless position would retard the flowering period till all danger from frost was past. If a position be taken at one end of the wall, it can readily be seen that even a single thickness of fish-netting affords some amount of protection, especially against the keen winds that prevail in the months of March and April. I find no evil results by pruning early, although it is usual for gardeners to defer the pruning of their Peach and Nectarine-trees till the last. I claim no other advantage than that it assists in the forwarding of the work, and less time is required in finishing them off; the trees being in proper training, and the man being in touch with his work can at a glance see what quantity of wood is required to cover the space at command,

and what he may remove. With regard to releasing all the trees from the wall, and tying them to stakes at some distance from the wall, I found that to answer admirably in a former place I had charge of near East Barnet, fourteen years ago, the walls there being little more than 7 feet high, and the trees young. It would, however, be a more difficult matter with large trees, and a wall 10 or 12 feet high; and unless the object is to cleanse the trees, or point the brickwork, or to entirely train the trees anew, my plan answers well, the new method having superseded the old. *W. H. Sharpe, High-wood Gardens, Rothampton.*

HORTICULTURE AT GLASGOW EXHIBITION.—Almost every conceivable subject is to be represented at the great exhibition in Glasgow next year, and arrangements have been made for some time back by the various sections; but I have not learnt that horticulture has been included. At the last Glasgow exhibition it was represented by one or two flower shows; these, however, were included among "amusements." Can any of your readers say if the horticulturists of Scotland, particularly those of Glasgow, have taken any steps to have horticulture properly represented at the forthcoming exhibition? *A Horticultural Secretary.*

PLANT-PESTS.—I recently paid a visit to Mr. McFadzean, gardener to Lord Massey, Killakee, and he volunteered the following formula as a cure for aphids, thrips, red-spider, &c., one which he uses extensively with perfect success, and which has done no harm to the foliage or wood of the plants, so far as he has tried it. Take half-a-pound of pearlash, and an equal weight of caustic soda, and dissolve them in 5 gallons of hot water. When the whole mixture is thoroughly dissolved, and has become cool, he employs it with a spraying-syringe on whatever plants require cleansing. He told me that it will kill red-spider, thrip, and destroy mildew. He is also of the opinion that if it could be got to adhere to Grape-vines it would destroy mealy-bug. For the eradication of mealy-bug, the preparation given above should have the addition of soft-soap. It would be advisable before practising it on an extensive scale to try it experimentally, and note the results. *A. O'N.*

PIECEMEAL EXTENSION OF VINE-BORDERS.—Late spring affords a suitable season for enlarging the width of Vine-borders which were intentionally made small at the time of the planting of the Vines. This is applicable to borders of which a width of only 3 feet out of the 9 or 12 feet of width allowed as the ultimate limits of the roots has been made up. Supposing the exhausted soil of the border to be done away with is still in its place, this should be excavated to the width of 3 feet back from the newly-made border, and about 2½ to 3 feet deep, i.e., 3 feet at the back and 2 feet at the front. Having cleared this space of soil and made the bottom smooth and sloping to an outlet drain, place brickbats, clinkers, or stones to the depth of 6 inches thereon, if the sub-soil be chalk or lime-stone; but if the soil overlies gravel, and the water-level is at a great depth, artificial drainage will not be required. A border ranging in depth from 2½ feet at the back, and 2½ feet at the front, will afford ample space for the roots. It is a good practice to place a layer of turf, grassy-side downwards, over the bottom or over the artificial drainage, and thus afford free passage for the water. In excavating the exhausted soil, all Vine-roots found should be cut back to the line dividing the made portion from the unmade section of the border. The trench is then ready for being filled with the best available soil, preferably turfy-loam which has been cut and stacked for a year, and one-quarter of old lime-rubble and horse-droppings. The turf should be broken up with a digging-fork or spade, the whole being well mixed before it is wheeled into the trench. Where these materials are not obtainable, the staple should be enriched with decayed manure that is free from worms, and with fresh soot, at the rate of 1 bushel to every cartload of soil and manure, and the whole mass turned over twice before being placed in the trench. I may here say that very tenacious clayey loams are not suited to the Vine, and should not be used. At the first, and frequently before giving water at the roots, dressings of artificial manure, may be applied during growth—that is, from May till September. Soot in itself is a strong fertiliser and purifier, and dressings applied at fortnightly intervals, and in

quantity sufficient to discolour the ground, to Vine and Peach borders when the fruit is swelling, and water applied to the soil forthwith, produce satisfactory results. Soot may be obtained at small cost in the neighbourhood of large towns, and fair samples may be bought in the rural districts at from 5d. to 6d. per bushel. These remarks are applicable to Peach-tree borders as well as Vine borders. *H. W. Ward.*

THE NEW CHISWICK.—It has been suggested in the columns of the *Herts Advertiser* that in the event of a new garden being secured by the Royal Horticultural Society in place of Chiswick, a good centre might be found in Hertfordshire. Mr. C. E. Pearson in your last issue refers to the question of railway competition, and in this connection may I suggest that no more convenient spot could be fixed upon than St. Albans. It is within half-an-hour's run from London, and possesses stations on three lines of railway—the Midland, the London & North Western, and the Great Northern. St. Albans also has many attractions, being an historical picturesque city; and its well-wooded environs make it a delightful place of residence. No more central or suitable spot could be found. *A. E. Gibbs, St. Albans.*

NEPENTHES AND LOW TEMPERATURES.—Recently I had the opportunity of looking round some greenhouses, and in one of the stoves my attention was drawn to a somewhat fine healthy plant of *Nepenthes Mastersiana*, which I was informed had been subjected to 5° of frost for several hours during the spell of severe weather we had some little time since; the heating apparatus having given way at the commencement of the frost. Up to the present time the plant does not appear to have suffered in the smallest degree, since both leaves and pitchers are not showing any signs of shrivelling. Many of the other stove-plants in the same house have either been killed outright or damaged past recovery. The above fact goes to prove that *N. Mastersiana* is much more hardy than generally thought. The crossing of the two old species, viz., *N. sanguinea* and *N. distillatoria* (Khasiana of science), the latter being the pollen plant, has produced a valuable variety that will stand a much lower temperature than the other kinds. *Albert E. Ratcliff.*

SAXIFRAGA PELTATA.—The illustration of *Saxifraga peltata* by the side of a stream in California (p. 139) reminds me of this plant growing in a somewhat similar position in Ireland. This is at Mount Usher, in County Wicklow, where the Messrs. Walpole have such a charming garden. The little river Vartry, which supplies Dublin with water, runs through the garden, and on one side, close to the water-edge, *Saxifraga peltata* is growing in a most vigorous manner. The most noteworthy thing about it is not the robust growth it makes, or its free flowering, but the way in which the great thick roots creep along and cling to the rocks in the bed of the river. The water is beautifully clear, and one can thus see the way in which the great rope-like rhizomes lay hold of the rock. In dry soil, this *Saxifraga* does very indifferently, and presents a vast difference from that growing where it has free access to water, as at Mount Usher. It is perfectly hardy in my garden, but it does not flourish in the dry soil. *S. Arnott, Carresthorn-by-Dumfries, N.B.*

YEW-TREES IN WARWICKSHIRE.—The lanes and neighbourhood here [Warwickshire] are exceedingly beautiful, most of them narrow, and canopied over by Oak, Ash, and Elm. Yew-trees and Holly are found plentifully, and evidently of great age, in the churchyards, by farm-houses and cottages, and also by the waysides. Topiary-work seems also to have its admirers in this neighbourhood. Not far from my house, there exists in the garden of a farmhouse a healthy, well-developed, and neatly-cut Yew-peacock, with fully-expanded tail; the dimensions of this live bird are 9 feet high, 8 feet long, and 7 feet wide. At the same place there also existed two more fancifully cut Yews; unfortunately, they grew just before the dining and drawing-room windows, which they darkened so much that the tenant obtained permission from his landlord to have them cut down. Instead of giving some admiring Goth in this line an opportunity of taking them away, they were ruthlessly grubbed up and burned! *W. Miller, Berkswell, Warwickshire.*

LAW NOTES.

OBTAINING GOODS BY FALSE PRETENCES.

At the York Assizes on Wednesday last, John William Taylor (36), vegetable salesman, was indicted for obtaining by false pretences from Messrs. Towler & Son, 2,500 Spruce Fir-trees, with intent to cheat and defraud at Aisakew, on December 8, 12, and 19. Mr. C. Mellor prosecuted, and Mr. Sawan Taylor defended. Prosecutors are seedsmen and nursery-gardeners at Bedale. It was alleged that prisoner, by letters and other means, represented himself to them as a man of substance carrying on a genuine business, and in a position to pay for any goods they might supply him with; by so doing he obtained from them the articles mentioned in the charge. His bill-heads represented that he was carrying on business as a fruit and vegetable salesman and commission agent in the Green Market, Newcastle-on-Tyne, whereas he had never sold in the Green Market at all. Messrs. Towler & Son had not been paid for the Fir-trees with which they supplied him. The jury found a verdict of guilty. Prisoner admitted a previous conviction for a similar offence. Sentence of twenty-one calendar months imprisonment with hard labour was passed.

Obituary.

WILLIAM HUGH GORRIE.—It is with regret that we have to record the decease of Mr. W. Hugh Gorrie, late gardener to Sir W. Hozier, Mauldslee Castle, Lanarkshire, on the 5th instant, aged 65 years, after a painful and protracted illness. Mr. Gorrie was well known in Scotland as a very successful gardener. His opportunities were great, and these he embraced with zeal, and in early life showed great talent as a cultivator.

Mr. Gorrie had a capital training under his father at Polmaise, near Stirling. After making the best of his time as journeyman, Mr. Gorrie went to Leichie, East Lothian, as foreman, and was in the same capacity for some years under the late Mr. Lee, in Tynninghame gardens. Thence he went as head gardener to the late Colonel Ferguson, Raith, Fifeshire. That proprietor being a great lover and liberal patron of gardening, Mr. Gorrie was able to turn his talents to good account in the fine gardens placed under his charge. Under his management horticulture at Raith attained an amount of success seldom equalled in the North, visitors going from long distances to see the decorative work, which was exemplified in the fine flower gardens year by year in a most striking manner. Mr. Gorrie was always treated by his employer as a trusted friend. After the death of the Colonel he left Raith (where ten years' service showed great skill), and went as gardener to Sir W. Hozier, where he remained for nearly thirty years. His services as a judge were much sought after at the large northern shows, and his decisions commanded great confidence. Mr. Gorrie has left a widow and grown-up family to mourn his loss. *M. Temple, Carron, N.B.*

GEORGE J. SYMONS.—We regret to announce the death of Mr. G. J. Symons, F.R.S., the eminent meteorologist, the founder of the British rainfall organisation. His death took place on Saturday afternoon at his house in Camden Square, N.W., after an illness of a little over three weeks. We extract from the *Times* the following particulars concerning his career:—

George James Symons was born in London in August, 1838. From his boyhood he exhibited a love of natural science, and it is said that he offered his services as an assistant at the age of sixteen to Mr. James Glaisher, who, however, attempted to dissuade him from pursuing scientific investigation on the ground that it did not pay. Symons, nevertheless, persisted in his aim. At the age of eighteen he joined the Meteorological Society, which Mr. Glaisher had founded, and in the course of another

twelve months found employment as one of the Registrar-General's meteorological reporters, an office which he continued to hold to the time of his death. In addition to his official duties, Mr. Symons was already collecting records of the fall of rain. He foresaw the importance of a study of the rainfall in view of the increasing demand upon the water resources of the kingdom, necessitated by the growth of population, improved and more systematic sanitation, and the additional demands of growing industries. In 1860 he published his first annual volume of the *British Rainfall*, which contained records from 168 stations—namely, 163 in England and five in Wales, there being none for Scotland or Ireland. With persistent energy he continued for forty years to develop this unique organisation of voluntary observers. His last published *British Rainfall*, for 1898, contained records from 2,545 stations in England, 237 in Wales, 436 in Scotland, and 186 in Ireland—a total of 3,404 stations. In 1866 he began the publication of *Symons' Monthly Meteorological Magazine*, which has been continued up to the present time. It is claimed for him that at the time of his death he was the head of one of the largest purely volunteer organisations in existence, having over 3,000 observers in all parts of the kingdom. His annual digest of their records is a standard work in which not only meteorologists but civil engineers, sanitary experts, and others place unquestioning confidence.

He was among the first to perceive in this connection the necessity of determining the amount and distribution of the water supply. His first step was to ascertain what records of rainfall were already in existence. These he found to be very much scattered; while some parts of the country were more or less covered, other very large districts were entirely without them, and such records as there were related to varying periods of time, and could not be correlated. This was the cause of his setting to work to organise a band of observers who would undertake to observe the amount of the rainfall each day, using tested gauges satisfactorily exposed, and capable of giving accurate results. The need of precautions to ensure these conditions was apparent to all as soon as they were put into practice, for the data already in existence were proved to be frequently valueless. One gauge was discovered which had been ornamented with a small roof to protect it from the rain, which it was its purpose to measure. Others were placed where water could drip into them from overhanging trees, and so forth. Mr. Symons visited personally and tested every gauge. The proper distribution of the gauges over the kingdom was also part of his task. Private individuals were induced to take up the work, procure gauges at their own cost, and make the observations methodically from no motive but the public good. The result of these labours has been the accumulation of a mass of data such as exists in no other country, and which is now available for use in connection with a variety of questions relating to the sanitary and hygienic needs of the country. Mr. Symons told of one case in which a municipality was put to the expense of many thousands of pounds in rectifying a blunder in the calculation of the water available from a selected area, the mistake being due to the fact that a rod had been left projecting over the single gauge which formed the basis of the calculations, and that the rain dripping from the rod into the gauge was responsible for the district being credited with an absurdly exaggerated capacity for supplying water.

The use of lightning conductors was another matter in which he took interest. The existence of the "thunderbolt" was another subject of Mr. Symons's characteristically persistent attention. Whenever and wherever such a phenomenon was said to have been seen, Mr. Symons, if it was at all possible, himself visited the spot and investigated the evidence, with the invariable result that he could get no proof of an electric meteor having existed.

The council of the Society of Arts in 1897 awarded him the Albert Medal "for services he rendered to the United Kingdom by affording to engineers engaged in the water supply and the sewage of towns a trustworthy base for their work, by establishing and carrying on during nearly forty years systematic observations (now at over 3000 stations) of the rainfall of the British Isles, and by recording, tabulating, and graphically indicating the results of these observations in the annual volumes published by himself."

EDWARD JOSEPH LOWE.—We regret to record the decease of Mr. Edward Joseph Lowe, on Saturday, the 10th inst., at his residence, Shirenewton Hall, near Chepstow, in his seventy-fifth year. By his death we lose a man whose name has been before the public for fully half a century as an active worker in varied branches of science, and who leaves behind him as solid evidences of his work a host of beautiful volumes and smaller publications in which are depicted and described an enormous number of decorative foliage plants (beautiful-leaved plants); *Ferns: British and Exotic* (twelve volumes in all); *British Grasses, &c.*, while we have reason to believe a mass of material has been collected for the purpose of a further issue. Mr. Lowe was elected F.R.S. in 1867, F.R.A.S. in 1848, F.Roy.Met.Soc., of which he was one of the founders, in 1850; F.G.S. in 1853, and F.L.S. in 1857; and was also a member of the Conchological and other societies, to which numerous papers were contributed by him. Mr. Lowe was one of those fortunate men whose means enable them to pursue their hobbies without let or hindrance. Owner of a beautiful estate overlooking the Bristol Channel, he devoted himself to biological experiment of all sorts in connection both with the animal and vegetable kingdom, and consequently, odd breeds of cattle, or at any rate, odd and curious examples of cross-breeding, and strange facts and theories exemplified in pigs, sheep, and fowls, vied with a thousand odd forms of Ferns and flowers, to enchain the visitor's attention, and puzzle him with biological problems. At every yard in the garden something *outré*, or something exceptionally charming in the Fern-line, invoked attention; frames and glasshouses teemed with choice and sometimes unique varieties, and every now and again, a bed of spore-raised Hart-tongues would serve to illustrate Mr. Lowe's favourite theme of multiple parentage. Certain it is, that the expert eye could detect the features of several plants, but the crucial question of how far these were derived from grandparents, or even great-grandparents, could never be definitely settled, and now it is certain never will.

Mr. Lowe's splendid contribution to the Fern exhibitions at Chiswick in 1890 and 1892 will never be forgotten, and is hardly likely to be equalled for some time to come; and his loss, as one of the pioneers of British Fern-culture, and as a chronicler of varietal forms of Ferns, is irreparable. *C. T. D.*

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 13.—There was a large display of exhibits at the fortnightly meeting of the Committees of this Society held on Tuesday last in the Drill Hall, James Street, Westminster. But though the hall was better filled than at any previous meeting this year, there were not many novelties shown, exclusive of Orchids. The Floral Committee, for instance, recommended one Award of Merit only, and that to *Pentstemon serpens*, exhibited by Mr. J. T. BENNETT-POW, who appears to possess quite a collection of interesting old-fashioned plants that are rare in gardens.

The Fruit and Vegetable Committee was exceptionally well attended, but all the awards it issued was a Cultural Commendation in respect to a dish of Dumelow's Seedling Apple, from the Duke of Richmond's garden.

The Orchid Committee recommended the award of a First-class Certificate to *Odontoglossum elegans*, Eastwood Park variety, from Baron SCHRODER, and of four Awards of Merit, two of which were for *Laelia Jonghiana* and a variety,

and the others for *Dendrobium Burberryanum* and *Odontoglossum crispum* "Surprise."

But if the Floral Committee had few novelties to consider, there were numerous groups to inspect, and nine Medals were awarded. Some of the more important were *Cyclamen*, Chinese *Primulas*, Hardy *Azaleas*, *Ferns*, *Prunus*, *Cinerarias*, *Hyacinths*, *Narcissus*, &c.

The Narcissus Committee met, but had very little to inspect. Mr. S. T. WRIGHT, Superintendent of the gardens at Chiswick, was absent through illness, and his duties were carried out by Mr. HUMPHREYS.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. P. de Villemorin, C. T. Drury, H. B. May, R. Dean, G. Reuther, J. H. Pitt, W. Howe, Jas. Hudson, J. Jennings, J. F. McLeod, Robt. Fife, C. J. Salter, W. H. Lees, J. Fraser, George Gordon, Chas. Jeffries, Jas. Walker, W. Bain, J. D. Pawle, E. H. Jenkins, H. S. Leonard, C. E. Shea, W. J. James, Herbert J. Culbush, H. J. Jones, C. Blick, Geo. Paul, J. W. Barr, T. W. Sanders, and Ed. Mawley.

Cyclamens were splendidly shown by the CHURCH ROAD NURSERY COMPANY, Hanwell, who had a group of plants in pots that more than furnished one half side of one of the long tables. The strain shown was excellent in respect to the habit of the plants and brilliancy and substance of the flowers (Silver Flora Medal).

The Chinese *Primula* was shown on this occasion by Messrs. JAR. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea. These included several varieties with white flowers, as *Gigantic White*, *Queen Empress*, *Fringed White*, *Mrs. Makins*, &c.; also *Gigantic Rose*, *Gigantic Blue*, and *Fringed Red*. The star *Primula*, *P. stellata*, was shown in several colours, including rose and white. A variety, *Mrs. Harry Veitch*, appeared to be a variety combining the characteristics of the "star" strain with those of the florists type; it is a very pretty, free-flowering plant, with larger flowers than the Star *Primula*, of pure white, but possessing in some degree the tier-above tier habit of that type. Of semi-doubles there were mauve, crimson, and salmon tinted varieties, the colour in each case being beautifully clear and bright.

Cinerarias from Messrs. J. JAMES & SON, Woodside, Farnham Royal, were admirable, whether from the point of view of cultivation or merit of strain. The plants bore many unopened buds, and would become even more showy, but those already open were of huge size, and of exceeding brilliancy. A Silver-gilt Banksian Medal was deservedly awarded this exhibit.

Messrs. BUTTON & SON, Reading, exhibited a group of *Cinerarias* in two varieties, remarkable for new shades of colour. New Pink is a very dwarf-habited plant (as shown), with fairly large flesh pink flowers, rather more "starry" in form than some of the florist's type. The contrast of the pink petals with the blue disc has a singular effect. Light Blue has much the same habit, is very free-flowering, and compared with the deep blue of some *Cinerarias*, the flowers are light in shade.

Roses were again very beautiful from Mr. GEO. MOUNT, Canterbury, who had excellent specimen cut flowers, with stout stems and vigorous foliage of the varieties *Catherine Mermet*, *Captain Hayward*, and *Mrs. John Laing* (Silver Banksian Medal).

Messrs. R. & G. CUTHBERT, Southgate Nurseries, Middlesex, showed a group of hardy *Azaleas* in pots. So densely bloomed were these that they produced a most showy effect, and a considerable number of choice varieties were represented. One of the more richly-coloured varieties was named "Brilliant." The so-called *A. mollis* x *sinensis* hybrids were very pretty (Silver Banksian Medal).

Messrs. CUTHBERT also showed plants in flower of a new white-flowered *Azalea*, which is believed to be quite hardy. The flowers are semi-double, and remind one of those of *Deutsche Perle*. The leaves are rather large, and are thickly covered with soft hairs. A large number of plants have been out-of-doors at Southgate during the whole winter and are uninjured, but the plants shown were lifted six weeks ago, and have flowered in pots. It will be a valuable variety if it can be grown permanently out-of-doors.

Mr. JOHN RUSSELL, Richmond Nurseries Surrey, also made an exhibit of hardy *Azaleas* in flower, the plants presenting almost an unbroken mass of bloom in many varied shades of colour (Silver Banksian Medal).

Messrs. JOHN LAING & SONS, Forest Hill Nurseries, London, staged a group of miscellaneous plants, including *Odium*, *Cordylines*, and many ornamental species.

Messrs. PAUL & SON, Chessant, Herts, showed a few species of hardy plants in flower, including *Saxifraga lutea purpurea*, *S. oppositifolia*, *S. o. alba*, *S. Boydii*, *S. Sancta*, &c., *Hepaticas*, *Helleborus*, *Primula verticillata*, &c.; *Lachenalia luteola* and *Nelsoni* were also shown, but in pots, and a plant in bloom of *Prunus triloba* (Bronze Banksian Medal).

Mr. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, had a considerable group of *Hyacinths* and *Narcissus* in pots, staging a much better exhibit than on the last occasion. A new variety of *Hyacinth* with single flowers of pale blue colour known as *Mrs. H. J. Jones* was included (Silver Banksian Medal).

V. B. THURMAN, Esq., Norfolk Lodge, Barnet (gr., Mr. Thos. Walcroft), showed a group of blue *Primroses* in flower.

Messrs. J. PRED & SONS, Rousell Park Nurseries, Norwood

Road, London, S.E., exhibited a quantity of market plants in baskets. The plants were such as *Hyacinths*, *Ericas*, *Cytisus racemosus*, *Begonias*, &c.

Messrs. F. SANDER & CO., St. Albans, again showed some new varieties of *Camellias*, with such topical appellations as *Lady Smith*, *Kimberley*, &c., but they failed to win an award.

Messrs. WALLACE & CO., Kilnfield Nurseries, Colchester, exhibited *Anemone blanda*, and the new *Eranthis cilicica*.

Mr. H. J. ELWELL, Colesbourne, Andoversford, showed a pot-plant of *Kaiphosia primulina*, which has been in flower for a considerable period indoors. Mr. Elwell thinks that this very pretty yellow flame flower will prove hardy in warm localities.

Messrs. W. PAUL & SON, Nurseries, Waltham Cross, Herts, showed an interesting and extensive group of hardy deciduous flowering shrubs, especially rich in varieties of *Persica* (Peaches). There were remarked the *Carnation-flowered* variety, with a brilliant rosy-red, semi-double flower; the *Camellia-flowered*, not quite justifying its name, being scarcely more than single-flowered; the double white-flowered, with blooms 2 inches in diameter, and very freely produced; and *sanguinea flore-pleno*, a small-flowered variety. A double-flowered form of the Almond, and several of *Prunus*, viz., *P. triloba*, *P. Myrobolana rosea plena*, and *P. virgata rosea flore-pleno*. Of *Pyrus* we remarked *P. Malus floribunda Scheideckeri*, in white, and also in pink forms. Well-flowered plants of *Staphylea colchica*, of *Forsythia suspensa*, *Clematis indivisa lobata*, *Magnolia Soulangiana*, *Azalea indica Deutsche Perle*, *Rosa semperflorens* (China Rose), *Field Marshal*, a fairly full blossom of a deep crimson tint. The group was set off by some big plants of *Dracena indivisa* (Silver-gilt Banksian Medal).

Messrs. J. HILL & SON, Barrowfield Nursery, Lower Edmonton, exhibited an extensive collection of *Ferns*, such as they are accustomed to send to these meetings. In characteristic condition we may specify *Blechnum latifolium*, furnished with its red-brown-tinted young fronds. *Adiantum scutum*, showing fronds of a lighter tint; *A. Faulkneri*, a species whose fronds possess very minute pinnae; *Actinopteris australis*, with slit, fan-shaped fronds, which lay almost on the soil. A pretty form of *Adiantum capillus-veneris*, well-named *imbricatum*, with large overlapping pinnae giving the fronds a massive appearance. *Pteris tremula* var. *Smithiana*, and other fine *Ferns* (A Silver Banksian Medal).

Messrs. VEITCH & SONS, Chelsea, showed a group of *Prunus Cerasus* *Watereri*, as tall standard and dwarf bushes. The plants exhibited thoroughly the free flowering property of the variety.

Messrs. BARR & SON, 12 and 13, King Street, Covent Garden, London, W.C., had a rather extensive collection of species and varieties of *Narcissus* as cut flowers. The group was showy and pleasing, and well exhibited the usefulness of the *Narcissus* for early spring decoration when forwarded by cold frame cultivation, and in some cases by actual forcing in heat. The exhibit contained besides those flowers, various species of *Cyclamens*, *Fritillarias*, *Scilla*, *Crocus*, *Chionodoxa*, and *Helleborus* (A Silver Banksian Medal).

Mr. H. B. MAY, Dyson's Lane Nurseries, Edmonton, showed a group of plants of *Clematis*, including the varieties *Miss Bateman*, *Lady Lonsborough*, *Lord Wolsley*, *Fair Rosamond*, *Albert Victor*, and *Mrs. Quilter*. The plants had evidently been brought into bloom in warmth, and all of them were young, flowering for the first time. The flowers were well brought out by an undergrowth of small *Ferns*. He likewise showed a number of small plants of *Gloire de Lorraine Begonia* in bloom, an unusual event at this season.

Messrs. W. CUTRUSH & SON, Highgate Nurseries, London, furnished a table, running cross-ways of the hall, with a fine collection of plants of miscellaneous species.

Awards.

Pentapterygium serpens.—A small *Vacciniaceous* shrub, introduced from the Himalayas sixteen years ago. Rarely more than 3 feet in height, the stems have a tendency to droop, and the leaves are small. The flowers have tubular corollas, and are very conspicuous, being rather less than an inch long; colour of corolla bright red, calyx green. From Mr. J. T. BERNETT-POE, Holmewood, Chessant (Award of Merit).

Orchid Committee.

Present: J. Fowler Gurney, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Ballantine, Norman C. Cookson, H. Little, J. Gabriel, H. J. Chapman, W. Potter, F. Sander, W. H. White, E. Hill, H. T. Pitt, H. A. Tracy, W. H. Young, and J. Douglas.

Dendrobiums were again a great feature in the show, a group of very finely-grown hybrids of the *D. splendissimum* grandiflorum class being exhibited by T. B. HAYWOOD, Esq., Woodhatch, Reigate (gr., Mr. C. J. Salter). All the plants were finely flowered, and showing a great variety. A grandly-flowered x *Schneiderianum* and other hybrids were also included, and a Silver Flora Medal was awarded (see p. 162).

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whiffen), was adjudged a Silver Banksian Medal for a nice group in which were several remarkably fine forms of *Cattleya Trianaei*, the best of which were C. T. *Amesiana*, a pure white flower with yellow centre to the lip, which had a pure pink front lobe; and C. T. *regalis*, a very large and finely-formed dark-coloured flower. There were noted in the group, plants of *Odontoglossum Halli*, *O. crispum*, *O. x Adriane*, *Laelia harpophylla*, and of *Coleogyne cristata alba*.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr., Mr. Wm. Murray), showed three remarkably distinct and fine varieties

of his beautiful *Phaius* x *Normani* (*Sanderianum* x *tuberculatus*), viz., P. x N. *pulcherrimus*, a very light-coloured flower with sepals and petals cream-white, with a very faint rose-tint, and lip of a light rosy-lilac tint; P. x N. *grandis*, a large flower having the sepals and petals tinged with rose, lip of rose, freckled with claret colour, and bearing an orange-coloured keel, and some yellow lines; and P. x N. *atro-rubens*, of a rich purplish-rose, with purple lip of a dark tint.

Sir TREVOR LAWRENCE, Bart., Burford Lodge (gr., Mr. W. H. White), showed white *Dendrobium nobile* var. *virginale*, and *D. nobile* var. *Cooksoni*, Burford variety, showing an improvement on the older form shown last year.

Messrs. JAR. VEITCH & SONS, Ltd., Royal Exotic Nursery, King's Road, Chelsea, again showed their fine *Laelio-Cattleya* x *Antimachus* var. *Caenea* (L.-C. *Dominiana* roses x C. *Warszewiczii*), a dark, richly-coloured flower, still having the fine perfume of C. *Dowiana* inherited from one of the parents of L.-C. x *Dominiana*; L.-C. x *Pisandra* (C. *Eldorado* x L. *crispus*), with flower resembling a small L. C. x *exoniensis*; and *Dendrobium* x *Imogen* (signatum x *suosum* leucotermum), with pretty pale yellow flowers.

Messrs. HUGH LOW & CO., Bush Hill Park, staged a group in which was noted a fine specimen of *Dendrobium Brymerianum*, furnished with numerous flowers; good plants of *D. barbatulum*, *D. x Dominiana*, *D. Madonna*, *D. Wardianum* Lowi, *D. nobile murrinianum*, *D. rubens grandiflorum*, *Cymbidium eburneum*, *Cypripedium*, and others.

His Grace the Duke of RICHMOND AND GORDON, Goodwood gr., Mr. Parker, showed *Dendrobium nobile* var. *Lady Caroline* (Gordon-Lennox, having large flowers with white sepals and petals, with rose-purple tips, the centre of the lip of a dark maroon tint, and the rest of the lip white with a rose coloured apex. The plant was small, and when grown at its best it should prove one of the largest-flowered of the species).

Mr. J. CYPHER, Cheltenham, staged a good group, principally *Dendrobiums*, among which were *D. nobile nobiliss*, still the best in colour of any form of this species; *D. x Ainsworthi*, Cypher's variety, striking, on account of the bright rose tint; *D. x splendissimum* Thompsoni, *D. x Luna*, *D. nobile Cooksoni*, *D. x Wigane*, several forms of the little *D. x Ethel* (moniliforme x *Rolfes roseum*), varying from almost pure white to rose-pink, with dark centre; *Masdevallia Veitchiana grandiflora*, and a very pretty cross named *Cypripedium* x *Daviesianum magnificum* (Boxall x *Argus Moensii*).

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr., Mr. J. M. Black), staged a small group of *Dendrobium*, &c., in which one good plant of a bright yellow form of *Dendrobium aureum* was remarkable.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed *Cypripedium* x *Boxall-Rothschildianum*, a remarkable cross raised originally by Mr. N. C. COOKSON. The quaint-looking flower had a dorsal sepal heavily lined with dark purple, the lower half showing green ground colour, the margin white, the deformed petals greenish with purple lines, the lip whitish with a pretty veining and a rose-flush. The staminode bore distinct evidence of the cross.

WALTER COBB, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), showed a pretty form of *Odontoglossum elegantiss*, flowering for the first time from an imported plant.

R. G. FLETCHER, Esq., Mount Harry, Brighton (gr., Mr. Garnett), showed *Odontoglossum crispum* Fay Fletcher, a fine, rose-tinted flower, with white lip; the petals and lip having some red-brown blotches.

A. H. WINGFIELD, Esq., Amphill House, Amphill (gr., Mr. W. J. Empson), sent seedling *Cypripediums*.

Mr. H. A. TRACY, Twickenham, showed *Cattleya Trianaei* Furzeana, a pretty flower with rich ruby-crimson front to the lip.

Captain HOLFORD, Westonbirt (gr., Mr. A. Chapman), sent *Cypripedium* x *Thompsoni inversum*, a fine flower of the C. x *Calypso* section; and a good light-coloured variety of *Cattleya Trianaei*.

ARTHUR HAY, Esq., Oakley Park, Eye, Suffolk, sent fine cut spikes of *Dendrobium atro-vioaceum*, *D. Johannis*, and an imported natural hybrid resembling *Laelio-Cattleya* x *Albanensis*.

Awards.

FIRST-CLASS CERTIFICATE.

Odontoglossum x elegans, *Eastwood Park* var., from Baron Sir H. SCHRODER, The Dell, Staines (gr., Mr. H. Ballantine). A very much larger and finer form than the ordinary variety, which was also shown for comparison. The narrow segments extended over 5 inches, and were of a pale yellowish colour, heavily blotched with chocolate. The long apiculate segments bore evidence of *O. cirrosum*, which, with *O. Halli*, produced it.

AWARD OF MERIT.

Laelia Jongheana, from H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood). A fine typical form was shown with bright rose flowers, having the paler lip finely decorated with raised orange-coloured ridges.

Laelia Jongheana Templei, from Mrs. TEMPLE, Leywood, Groombridge (gr., Mr. Bristow). The best form which has yet appeared. Sepals and petals bright light rose, lip wavy, cream-white in front with a slight rose tinge, the centre bearing the orange-coloured keels peculiar to the species.

Odontoglossum crispum, *Oakfield Sunrise*, from THOS. BAXTER, Esq., Oakfield, Morecambe (gr., Mr. R. Roberts). One of the most remarkable forms which has yet appeared, and totally distinct from all others. Flowers of medium size, the sepals white, slightly tinged with yellow, the narrower petals having

the greater part of the surface coloured (not blotched), with bright brownish-red, the bases showing a little white, the slightly constricted outer half white, with some small, reddish markings at the tip. Lip narrow, the middle half rolled back, front broader, white. The base of the lip bore narrow brown lines; crest yellow. A very remarkable form, the origin of which does not appear.

Dendrobium × *Barberryanum* (*Findlayanum* × *Dominianum*), from Sir Trevor Lawrence, Bart. A very bright hybrid raised some years ago by the Right Hon. JOSEPH CHAMBERLAIN. Sepals and petals purplish-rose, their bases white. Lip white with dark claret-coloured base, yellowish-white middle area, and bright rose tip.

CULTURAL COMMENDATION.

To Mr. F. J. Thorne, gr. to Major JOCEY, for a fine specimen of *Dendrobium* anti-violeaceum bearing about fifteen finespikes of flowers.

Narcissus Committee.

Present: J. T. Bennett-Pot, Esq. (Chairman); and Messrs. C. R. Scrase-Dickins, W. Goldring, R. Sydenham, P. R. Barr, J. Pope, J. de Graaff, Miss Willmott, and Rev. G. H. Engleheart.

The Narcissus season is opening with every appearance of lateness, owing no doubt to the severe drought of 1899, which retarded the starting of root-growth. The Committee, therefore, had light work, no individual varieties being submitted, and only one group staged; this, from Messrs. BARR, consisted of an extremely well-grown collection of pot plants, short in foliage, and with well-developed flowers of the leading trumpet varieties. A single bloom of the fine new bicolor Duke of Bedford was included (Silver Banksian Medal).

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. W. Wilks, R. Parker, E. Beckett, E. Shaw Blaker, Jos. Cheal, M. Gleeson, Jas. H. Veitch, P. C. M. Veitch, A. H. Pearson, W. Pope, Alex. Dean, S. Mortimer, A. F. Barron, W. Bates, H. Markham, C. Herrin, Geo. Wythes, Geo. Kelf, F. Q. Lane, G. Reynolds, W. J. Empson, Jas. Smith, G. Norman, J. Willard, Geo. Bunyard, and W. Poupert.

From the gardens of the Duke of Richmond, Goodwood Park (gr., Mr. R. Parker), were shown fine samples of several varieties of Apples, and a Cultural Recommendation was awarded for extra good fruits of the old Wellington or Dunselow's Seedling. Other varieties shown were Goodwood Pippin, and two strangers in Kitchen Keeping and Marketing. Early Radishes came from Mr. J. Crook, gr., Forde Abbey, Chard.

There were several varieties of Apples staged for Certificates, including one known as King's Acre Pippin from the English Fruit and Rose Company, Hereford, but all of them failed to obtain awards.

Lecture.

EVOLUTION OF PLANTS.

In the afternoon a lecture was delivered by Mr. R. IAWIN LYNCH, the title of his subject being "The Evolution of Plants, illustrated by various garden-strains coming true from Seed." Mr. Lynch explained that in general he agreed with the theory of Darwin in respect to the evolution of plants, a theory that to-day was better attested by facts which are undisputed than Darwin could have ever hoped. Darwin's theory embraced (1) variation, (2) struggle for existence, (3) survival of the fittest. Mr. Lynch maintained that evolution in respect to garden plants was carried out by the same means as are adopted in Nature. The processes are the same. The bearing of the continuity of protoplasm upon the theory of heredity was explained, and it was shown that hybridisation has its place in the scheme of Nature, and that new species are evolved in Nature by the hybridisation of older species. Mr. Lynch showed by numerous attested illustrations that garden hybrids are often quite equivalent to new species, and behave altogether as the so-called pure species do. Two of the instances quoted were *Montbretia croceomiflora*, and *Urceochoris Clibrani*, both of which bi-generic hybrids it was declared are exceedingly fertile; and in the former case, Mr. de Vilmorin had written that he believed it would be possible to fix the colour.

An endeavour was made to answer the question, whether it is possible to determine the limits of genera and species by sexual affinity, and it was pointed out that, philosophically, we can hardly make any distinction between hybrid and cross. The experiment of isolating "rogues" was suggested, to see what might be the result of this form of selection; but as a better experiment, it was recommended that the "rogues" and the best of the crop be allowed to cross together, so that they might settle down to some natural level. It has not been proved that this would result in reversion to original parents. The observations of Darwin in his *Origin of Species* should be consulted.

Mr. O. E. Shea (Chairman) observed that he agreed with the main positions taken by Mr. Lynch. Evolution in the garden was effected by natural methods, plus man's intelligence. But it remains a mystery what is the first cause of original variation, by which one plant is rendered more fit to survive than another.

Dr. Masters gave some interesting particulars respecting Passion-flowers. Hybrids had arisen between *Passifloras* and *Tacsonias*, and the differentiating characteristics of these genera had thus disappeared. He considered it was perfectly a that hybridisation is one means of producing new species.

Rev. Geo. Henslow was also in accordance with the greater part of Mr. Lynch's argument. But he objected to the view taken by Darwin of the influence of natural selection in the production of species. Selection, said Mr. Henslow, is not the cause of variation in form, though it may be of colour. In the former case it is wholly a question of environment.

LINNEAN SOCIETY OF LONDON.

MARCH 1, 1900.—Dr. A. GUNTHER, F.R.S., President, in the Chair.

Mr. W. SAVILLE KENT, F.L.S., exhibited lantern-slides of several British flowering plants, to show the remarkable advances which have been recently made in colour photography.

Mr. C. B. CLARKE, F.R.S., F.L.S., read a paper on "Botanic Nomenclature." He showed that the new rule adopted at Berlin—not to disturb names that had fifty years' user on the ground of priority alone—resulted in a practical uniformity with the system of naming adopted by Mr. Bentham and Sir J. D. Hooker. The Old World, he said, had thus reached a fair general agreement in nomenclature. The American botanists follow a new system which aims at finality on a so-called "non-shifting basis," in which the genus or species, as the case may be, is established on a type-specimen. Mr. Clarke's paper was devoted mainly to showing by selected instances that this system did not ensure finality; that the errors in determining what should be ranked as the type are enough to discredit the system; and the author commented on the disputed question whether a plant should be given the oldest specific name bestowed upon it, or the oldest specific name it bears in the genus in which it is now placed.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MARCH 5.—On the occasion of the meeting on the above date, W. THOMPSON, Esq. (gr., Mr. Stevens), exhibited a small collection of plants, amongst which was a peculiar form of *Odontoglossum* excellens, called nobilior. The flower was of good shape, and richly coloured, but the "squareness" noticeable in the lip of this cross was absent, and possessed more of the character of *O. crispum* than of *O. Pescatorei* in this respect. Another good thing was *O. King Alfred*, which received along with the preceding plant a First-class Certificate. A Silver Medal was awarded to the group. *O. pulchellum* Stevens, possessing fine large flowers of extraordinary substance was shown, and received an Award of Merit.

J. LEEMANN, Esq., Heaton Mersey (gr., W. Edgo), staged a very fine group of Orchids, amongst which were several plants of the pure white *Dendrobium nobile* var. *virginale*. The most striking and beautiful plant in the group was, perhaps, *Laelio-Cattleya* × *Empress* of Russia (C. Mendel × L. Digbyana). The plant is apparently not more than six years old, and the pseudo-bulbs, although sound and healthy, were of small size; the flower, nevertheless, was large, well formed, and very pretty, showing the charming characters of both parents (First-class Certificate). L.-C. Ernest var. *Prince of Orange*, a hybrid between *Laelia flava* × *Cattleya Percivaliana*, an attractive flower, with segments of a brilliant orange tint, glistered when bright light shone upon them; this flower received a First-class Certificate. *O. Adriane* var. *Meteor* received an Award of Merit, as also *Dendrobium nobile* Sanders, a well-formed flower of pale rose colour. An Award of a Silver-gilt Medal was made for this group.

T. STATTEN, Esq., Stand Hill, Manchester (gr., Mr. Johnson), exhibited four *Dendrobiums*, viz., *D. splendidissimum* giganteum, a well-formed flower, of a rich colour, which received an Award of Merit; *D. Ainsworthi*, Statten's variety; and *D. splendidissimum*, Stand Hill variety.

S. GRATRICK, Esq., Whalley Range (gr., Mr. M. Lead), exhibited two hybrids—L.-C. × *Warnhamensis*, West Point variety; and L.-C. *Warnhamensis* Charlesworthi variety receiving a First-class Certificate and an Award of Merit respectively. This hybrid is between *L. cinnabarina* and *C. Trianae* Norman; and the distinction between the two exhibited consisted in the superior form and colouring of the West Point variety.

Mrs. BRIGGS-BURY, Accrington (gr., Mr. Wilkinson), showed a good plant of *Dendrobium* × "Rainbow," which has been previously dealt with by the Committee. Mrs. STANLEY CLARK, Wrexham (gr., Mr. Edwards), exhibited *Dendrobium* × *Cecilia*, and D. Waltoni. HOLBROOK GASKELL, Esq., Woolton Wood, Liverpool (gr., Mr. Todd), exhibited a very fine form of *Dendrobium* *Wardianum* giganteum, and was voted a First-class Certificate. HERBERT PATTINGTON, Esq., Glossop (gr., Mr. Campbell), showed a small group of *Cattleya Trianae*, one of which received an Award of Merit; the plants were well cultivated (Vote of Thanks). E. H. SEDDON, Esq., Brooklands (gr., Mr. Milne), showed a plant of *Cattleya* × *callistoglossa*.

Mr. J. CYPRICK, Cheltenham, exhibited *Dendrobium rubens* var. *grandiflora*, and *D. × Rainbow*, both of which have previously been certificated by the Society; and a very good hybrid *Cypripedium Boxallii* × *Argus* Moensii, received an Award of Merit.

L'HORTICOLE COLONIALE (Linden), Brussels, exhibited a set of *Odontoglossum* × *Adriane*, of which all were beautiful and interesting; the Committee chose *O. × A. var. tigrina* for an award of a First-class Certificate. Awards of Merit were made to *O. × A. var. majestica*, and *O. × A. var. castanea*. *O. × A. var. delicata*, *O. × A. var. citrina*, and *O. × A.*

var. *pallens*, were also very choice and distinct, but were borne down by the superiority of the former varieties (Vote of Thanks).

Mr. A. J. KEELING sent a few nice plants, including *Cypripedium* × *M. de Curie*, C. × *Balloa*, *Laelia Jongheana*, *Dendrobium* × *Dulce* (Vote of Thanks).

Messrs. BACKHOUSE & SON, LTD., York, showed a good form of *Cattleya Trianae*, which was given an Award of Merit; it had a lip of very great brilliancy.

G. W. LAW-SCHOFIELD, Esq., Rawtenstall (gr., Mr. Shill), sent the pretty cross *Cypripedium* × *Shillanum* (C. Gower × *Rothschildianum*), a flower of fine proportions and dark colouring. The Committee confirmed their previous vote on this variety of an Award of Merit.

Dr. E. J. SIDEBOTHAM, Bowdon (gr., Mr. Shiner), exhibited a superior form of *Cattleya Trianae*, which received an Award of Merit. T. BAXTER, Esq., Morecambe (gr., Mr. Roberts), showed some good *Odontoglossums*, of which *O. crispum* var. *Hecla* was the best, a fine, bold, round flower of a rosy tinged throughout, the plant was a specimen, and bore two magnificent flower-spikes; it received an Award of Merit and Cultural Certificate. *O. × Andersonianum* Baden Powell, a good variety, received an Award of Merit; *O. crispum* Rosy Gem, *O. c. Gertie Baxter*, *O. Ruckerianum* Oakfield var., were also shown.

A very distinct variety of *O. crispum* was shown by a firm on behalf of Mr. Baxter, which was provisionally named *O. a. Surprise*, mentioned in the report of the Royal Horticultural Society meeting.

O. O. WHITLEY, Esq., Bridge Hall, Bury (gr., Mr. Rogers), showed *Laelia Jongheana* var. *gigantea*.

J. RICHARDSON, Esq., Altrincham, sent a good plant of *Laelia superbiens*, P. W.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MARCH 12.—The annual general meeting of this excellent Benefit Society was held on Monday last in the Caledonian Hotel, Adelphi, Strand. In the absence of Mr. S. T. Wright, through illness, the Chair was taken by Mr. Richard Deam, and there was an attendance of about thirty-five members.

The following is an extract from the—

COMMITTEE'S REPORT FOR 1899.

"Eighty-three members joined during the year, twenty-nine lapsed from various causes, two died, and two ceased to pay, being over seventy years of age; this leaves a net increase of fifty, the membership for the year being 791. The amount of subscriptions paid by members to the Benefit Fund, including arrears for 1898, was £1236 5s. 8d. The sick pay account was £206 2s., being £52 15s. less than last year. This is covered by deductions from members' deposit accounts of 6s. 5d. and 4s. 4d. respectively. There is a balance now in this fund (including £1201 15s. 11d. standing to the credit of lapsed members) of £12,190 9s. 2d.

"The Benevolent Fund is now doing useful work. Subscriptions amounting to £158 16s. 1d. have been received from honorary and benefit members, including £10 10s. generously given by W. Y. Baker, Esq., at the annual dinner. Various grants have been made from this fund, amounting to £60 5s. 6d.

"The Convalescent Fund continues to increase. Mr. Baker and Mr. Sherwood each gave a donation of £5 5s. at the annual dinner. Three members only applied for assistance during the year, the amount paid out being £4 only.

"The Management Fund shows a balance of £129 8s. 10d. The amount invested in corporation stock by the Treasurer during the past year was £1,500, the total invested funds being £15,850, and the Treasurer has £153 14s. 11d. in hand."

The Chairman in proposing the adoption of the report, described the condition of the Society's affairs as satisfactory in every detail. He could wish that there were more than 791 members, and suggested to the committee that perhaps further means could possibly be adopted of advertising the Society at flower-shows, and in other ways. Mr. W. Marshall having seconded the report, it was adopted unanimously.

Retiring members of the committee were re-elected with the exception of Messrs. E. T. Cook and — Forman, whose places were filled by the election of Messrs. C. H. Curtis and — Standridge.

Any of our readers who may wish to see the details of the balance-sheet may obtain a copy from the Secretary, as it was decided upon the motion of Mr. Marshall to print 5,000 copies for distribution.

A resolution of sympathy was passed, upon the proposition of Mr. Marshall, with the family of the late John Fraser, first Treasurer to the Fund.

On the proposition of Mr. Hudson, the meeting resolved to present the Secretary with a bonus of £10, which will make his salary for the year £52. The Committee was instructed to take into consideration the question of permanently increasing the Secretary's salary. Officers were re-elected, and votes of thanks passed. The Secretary is Mr. W. Collins, Martindale Road, Balham.

BOSTON AND DISTRICT DAHLIA SOCIETY.

THIS Society held a very successful Dahlia exhibition last year, and came out with a small balance in hand. It is proposed to continue the Dahlia Show in the present year, and Mr. Richard Flint, the treasurer, is making an appeal to lovers of the Dahlia for support. It is intended to have a larger show than last year if adequate support is forthcoming.

and also to hold it earlier in the season; but it will be necessary to take care the fixture does not clash with the National Dahlia Society's Show at the Crystal Palace, or the Seedling exhibition at the Drill Hall, while the Royal Aquarium and Wellingborough fixtures will have to be avoided. There appears to be evidence that a much greater interest is being taken in the Dahlia as an exhibition flower than prevailed a few years ago.

THE ROYAL DUBLIN.

Professor J. Johnson, F.L.S., delivered a lecture on the 9th inst., entitled "some aspects of Modern Botany." He pointed out that scientific botany was from several stand-points, its least scientific aspect, and the classification of the British school of botanists was less scientific than their co-workers the Germans. From the point of view of the field, botanist it was also dissimilar in which they found themselves. There is some hope that order may finally be expected owing to the labours of the editors of the *Index Kewensis*, &c. The subject of vegetable physiology was spoken to at length, and the early labours of R. Brown enumerated. Brown was one of those who helped to lay in Great Britain the foundation of modern vegetable physiology, and his labours in systematic botany were by no means meagre. In speaking of Tobacco culture, the Professor said that heavy nitrogenous manuring injured the flavour of Tobacco.

Reference was made to the Flax industry, and the advance that has been made in regard to it. The value of economic botany and museums was insisted upon, and various other interesting matters were discussed. A. O'N.

MISCELLANEOUS SOCIETIES.

Wargrave and District Gardeners'.—At a meeting held on Wednesday, Feb. 21, Mr. W. H. Scott presiding, the hon. sec., Mr. H. Coleby, read a paper on "Soil Formation," illustrated by diagrams and experiments. The position of the soil and subsoil as compared with older underlying rocks was first explained by reference to specially prepared diagrams, and the geologists' method of classifying rock by periods, according to their formation, was also shown. The natural causes of the crumbling of rocks, as heat, cold, frost, water, and air were next touched upon, and the manner of forming a soil from hard rock was described. Local and alluvial soils, peat bogs and their formation were in turn noticed, and the uses of the soil to the plant were pointed out. By means of simple experiments it was shown that the soil consists of a mechanical mixture of sand, clay, carbonate of lime, which were known as mineral or inorganic matter, and of humus or organic matter. The origin of each of these was explained, and their distinguishing features and use in the soil described. The chemical changes in what is generally known as "decay," were next explained, and the reasons why "heat" appeared in a hotbed. In conclusion, the characteristics of sandy, clayey, calcareous, peaty, and loamy soils were described.

— At a meeting held on March 7, Mr. H. Hill, gr. to N. Rattray, Esq., read a paper on the "Cultivation of the Cineraria," which gave rise to an interesting discussion. The exhibits included Hyacinths from Mr. GREENAWAY; an *Azalea* from Mr. FULLBOOK; *Cinerarias* from Mr. HASKETT; and a group of Orchids from Mr. Pope.

Isle of Wight.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday. In the absence of the Chairman of the Association (Dr. J. Groves), Mr. J. L. Mitchell was unanimously elected Chairman for the evening. Mr. S. Heaton gave a practical demonstration in "Fruit-tree Pruning," which evoked an interesting and profitable discussion.

Bristol and District Gardeners' Mutual Improvement Association.—The usual fortnightly meeting of the Society was held at St. John's Parish Room, Redland, on Thursday, 8th inst. A large attendance was presided over by Mr. Chas. Lock. Mr. R. Stewart, gr., Sneyd Park, provided the paper, which was on the subject of "Peaches and Nectarines." He disclaimed at the outset any intention of dealing with the culture of the fruits in the open air, and confined his remarks to Orchard-house culture. Mr. Stewart concluded an able paper by enumerating the varieties he thought most useful, and the many pests to which the Peach was liable. A good discussion followed, and Mr. Stewart was accorded a hearty vote of thanks on the motion of the Chairman.

Reading and District Gardeners'.—The large attendance of members present at the fortnightly meeting held on March 12, testified to the increased interest now taken in hardy flowers. The subject for the evening was "The formation and arrangement of a hardy Border with a list of Plants suitable for same," by Mr. D. Harris, Gardener to Col. Jekyll, Munstead House, Godalming. Mr. Harris said that the field open to the outdoor-flower gardener was a wide one, as the positions of gardens varied so much in character that gardeners had each to work entirely according to circumstances. The lecturer described the best sites and how to prepare them, spoke of soil, suitable plants and their arrangement, time of planting, &c. An interesting discussion followed, in which Messrs. Stanton, Neve, Townsend, Lever, Burditt, Hinton, E. J. Dore, Fry, Exter, and Chamberlain, took part. There were two floral exhibits by Mr. F. LEVER, The Gardens, Hillside, Reading; and Mr. W. TOWNSEND, The Gardens, Sandhurst Lodge.

FOREIGN CORRESPONDENCE.

DAHLIA NOVELTIES.

WHEN looking through No. 685 (dated Feb. 10) of your esteemed weekly, I found on page 85, under the title "The beginning of a new race of Dahlias," a few remarks, saying that the correspondent, Mr. E., in Canton, Mass., U.S.A., "had found in 1898, among his Dahlia-seedlings, a plant, some of whose flowers (single) had a long narrow floret lying on each of the usual broad ones, and that he never had observed anything of the kind before." With regard to which I beg to state some facts, which I hope you will not omit to publish in your columns at the earliest convenience. As early as 1894-95, a Dahlia similar to the one represented by the figure of Dahlia excelsa in *Gardeners' Chronicle*, p. 85, was introduced to the trade by the firm F. C. Heinemann, at Erfurt. This novelty, named Dahlia hybr. "Aegir," is a hybrid variety that originated in Heinemann's Nursery from a set of single Dahlias, and was described in his catalogue for 1895 as follows:—

"Aegir" is a completely new, peculiarly-formed flower, which reminds one of a double-flowered Pyrethrum. The tubes enclosing the anthers are so perfectly developed, that the latter are totally hidden; the outer petals of a lilac-rose tint, and partly slashed at their points. The plants are of faultless growth. The flowers stand well above the foliage, and from some distance the whole does not look at all like a Dahlia. "Aegir," as shown by an illustration in that catalogue, has nearly the same appearance as the *D. excelsa* represented on p. 85 of the *Gardeners' Chronicle*, and I will not omit to add, that plants of this variety, which I have seen myself with Mr. Heinemann, show already such a considerable difference in outward appearance, in the very stout and strong growth, that they may well be considered as the offspring of a new race. Therefore with regard to the statement of Mr. E. Canton, that he had found his plant among seedlings, the origin of these seedlings may probably be sought for in Heinemann's novelty "Aegir." As the horticultural trade of Erfurt conducts a very large trade with the United States of America, it is quite possible that some seeds or some tubers of the Dahlia hybr. "Aegir" may have reached that country. *Matthias Gebhard, Erfurt.*

ANSWERS TO CORRESPONDENTS.

AN OVER-DOSE OF MURIATE OF POTASH TO A VINE BORDER: T. A. As you have dressed the border at the rate of 2 lb. per lineal yard, and thus applied probably 8 oz. to the square yard, or four times as much as is safe, the substance is very likely to do harm to the Vines, unless you can wash much of it out of reach of the roots by a heavy application of water. Sulphate of potash, which you desired to use in place of the muriate, is very good when mixed with earth, &c., some kinds of plants as for example leguminous plants and root crops, but its use is barred by its price.

APPLE SHOOTS: *Manager.* Canker from a fungus (*Nectria*). Cut it out and burn at once. The red insects are Acari, feeding on the old wood, and on the new bark that is covering the old dead wood.

A PREVENTATIVE OF LOSS OF YOUNG TOMATO PLANTS: F. N. We would advise dressing the plants with sulphide of potassium at the rate of 2 oz. per gallon of water when established in the pots in which you are now placing them. The land they are going to occupy may be dressed with unslaked lime, just turning it in with the plough or spade. The Bordeaux or the potassium mixture might be applied twice or thrice during the summer as a preventative. For a safe dilute formula of the Bordeaux Mixture, see our issue for March 3, p. 144, under heading "Spot on Grapes, &c."

CARNATION DISEASED: *Enquirer.* The plant is affected by the Carnation Rust, and we doubt if any application of fungicide will be of much service when the fungus has overrun the leaves

so much as in the case of the piece sent. We are not acquainted with the virtues of the emulsion named in your note.

CHRYSANTHEMUM NIVEUM: S. G. R. & Son. Each year there are sent us a few blooms of some varieties of Chrysanthemums that by special treatment in the matters of stopping, &c., have been delayed from flowering until, and in some cases April. Niveum is admitted to be a valuable variety to produce white bloom after the New Year.

ENTRANCE TO KEW: W. M. You must communicate with the Director, furnishing him with testimonials and sketch of gardening career.

NAMES OF FRUITS: T. H., Haslemere. Apple Sturmer Pippin, remarkable for its late keeping qualities and excellent flavour.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—A. Hills. *Leucodendron argenteum* (Silver-leaf Tree).—H. B. F. *Cattleya amethystoglossa*, often called *C. guttata* Prinzii.—R. B. L. 1, *Mitrostigma axillare*; 2, *Dieffenbachia Shuttleworthii*.—T. H. O. P. *Begonia fuchsoides*, *Pinus exoclea*.—T. W. *Leucocium aestivum*, Snow Flake, a rare British plant.—*Hortus*. *Cypripedium callosum*, *Miltonia Clowesii*, the blotched flower; the yellowish flower *Ceoloyne fuscocens*. Why not put numbers to the specimens?—R. T. D. *Laelia Jongheana*. The photograph of *Odontoglossum crispum* represents a very good variety.—*Edina*. *Lycaste costata*.—J. A. 1 and 2, varieties of *Dendrobium fimbriatum oculatum*, 1, specially fine; 3, *Dendrobium nobile*, good; 4, *Dendrobium Pierardi*.

NITRATE OF SODA FOR LAND UNDER FRUIT-TREES: A. M. On ordinary soils the application of nitrogenous or ammoniacal manures is best for cereals, and phosphatic ones for roots and green crops is the rule, but it can only be broadly applied; and we think that you would be wiser if you employed more phosphates than nitrates, say, superphosphate of lime, dissolved bones, and nitrate of soda, at the rate of 3 cwt. per acre, if the land be retentive. Nitrate of soda is a wasteful manure to use on porous land, being carried away to the drains or the subsoil by the rains; and especially wasteful when used in late autumn and winter, for such soils cannot fix the nitrogen.

PALM WITH FUNGUS: T. M. The fungus is that known as *Graphiola phenicis*. Sponge them occasionally with an effective fungicide, and at other times syringe them with a similar liquid.

SPENT HOPS AND SPENT MALT AND ORCHIDS: *Constant Reader.* We would advise you to have nothing to do with these evil-smelling substances, but to stand the plants on wooden spar staging, placing a layer, several inches thick, of half-decayed tree-leaves under the staging, at 1 foot distant therefrom. This layer will diffuse mild fumes in the house, similar to the decaying vegetation of a tropical forest, and be beneficial to the plants.

THE VEGETATION OF THE GALAPAGOS ISLANDS.

IN the *Gardeners' Chronicle*, October 8, 1898, pp. 265-6, fig. 75, I gave some particulars of the Cactaceæ which constitute such a striking feature in the vegetation of the Galapagos Islands, together with a brief sketch of the life and labours of the late Dr. G. Baur, who worked so enthusiastically in the elucidation of the natural history of those interesting islands. That article was illustrated by a view in Barrington Island, with a very fine specimen of *Opuntia galapageia* in the foreground, solitary, yet flourishing amid blocks of lava, where almost nothing else could grow. (See *Gardeners' Chronicle*, October 8, 1898, p. 266, fig. 75).

I need not apologise for explaining that the Galapagos (Turtles, in English) are a group of volcanic islands on the equator, in about 90° west longitude, and 500 miles from the coast of Ecuador in western South America. There are about twenty named islands, besides a number of islets and rocks. The largest, Albemarle, is

about 100 miles long, and its mountains rise to a height of 5,000 feet. All the other islands are very much smaller. According to Baur and others, no volcanic activity has been reported since 1835, but in 1825 there was a tremendous eruption on Narborough Island.

Apart from introduced plants, known or suspected, the vegetation consists largely of shrubs and dwarf trees, having small leaves and inconspicuous flowers. Upwards of 300 species of flowering plants and Ferns have been recognised as aboriginal. Lilies and their allies, Orchids and Marantas, Bamboos and Palms, and numerous other families are altogether absent or very sparsely represented; yet in the upper zone vegetation is relatively rich and varied, and evergreen, due to greater humidity. Altogether, about thirty species of Ferns, including one arboreal species, have been collected, and as many or more of grasses and sedges combined. *Epidendrum spicatum* is an inconspicuous, endemic species, apparently very rare, for it has not, I believe, been collected since Darwin's time. One imperfect specimen of a *Eulophia* is the only other Orchid known.

Dr. Wolf and subsequent writers, who have actually visited the islands, state that there are three distinct belts of vegetation in all the islands in which there is any considerable elevation. The lower, or coast-belt, is the poorest, consisting of salt-loving plants, and scattered, stunted bushes, belonging to various families; but there is one prominent feature—the Cactaceæ. Among the commonest plants is a species of *Lantana*, which seems capable of growing and flourishing where the conditions are most unfavourable. The intermediate belt is wooded, though the trees are small; whilst the upper region is treeless. But it is of the lowermost or lava-field vegetation that I would give some further particulars. In my former article, cited above, I mentioned that Darwin was the first (1835) to make known the presence of Cactaceæ in the islands, and to point out their great utility in the economy of both plant and animal life; and Andersson, a Swedish botanist, who visited the islands some years later, thought he recognised five or six species of this family, but was unable to bring away specimens for more exact study. In 1891, Dr. G. Baur visited all the islands previously more or less explored, and in addition, collected in no less than eight others; his collections being by far more copious than those made by his predecessors.

Owing to some published remarks of mine respecting the little that was known of the Cactaceæ, he sent me the photographs here reproduced, together with some details of the development of the family in the islands. *Opuntia galapageia*, originally discovered by Darwin and described from his specimen, is the most conspicuous, and grows in the most exposed stony situations, close down to the sea. From superficial observation, Dr. Baur was of opinion that this species occurred in all, or nearly all, of the islands, varying considerably in stature and other characters in different islands; but from facts that have come to light since, it is probable that some of these supposed varieties are distinct species. I will repeat here what he has published on this point: "On Barrington, Indefatigable, and South Albemarle, it develops a tall trunk; on Charles and Hood, a relatively short but thicker trunk; on Jervis, a very short trunk, branching from near the ground; and on Tower island it forms no trunk at all." Dr. Baur attributed these

modifications to the varying degrees of humidity, or, perhaps one should say, of dryness, the greatest development occurring in the driest climate. The largest specimens of *Opuntia galapageia* were about 20 feet high, with a trunk 6 feet in circumference. It is equally remarkable for its stature and the smallness of its flowers, which are barely three-quarters of an inch in diameter.

The second photograph presented to me by Dr. Baur, and reproduced on p. 185 (fig. 61) represents a large *Cereus* growing among bushes, which was noted by Darwin, Du Petit-Thouars, and other early travellers. It will be seen that this *Cereus* is a prominent feature in the bush vegetation.

Last year Dr. Alb. Weber, of Paris, published (*Bulletin du Museum d'Histoire Naturelle*, 1899, pp. 309-314), a paper on the Cactaceæ of the Galapagos, in which he describes, or names, from very imperfect material, it must be admitted, three proposed new species. These are the three mentioned by Du Petit-Thouars (*Voyage autour du Monde*, ii., p. 291), one of which Dr. Weber identifies with the *Cereus* alluded to by Darwin, Baur, and others, and supposed to be the same as that represented in fig. 61. This he calls *Cereus galapagensis*, observing that it is doubtless the same as our plant, though he had no more material than we have to assist him in identifying it. However, he is probably right, though the possibility of the existence of two or more closely allied species is not considered by him. It is certainly very similar to *C. peruvianus*, but neither flowers nor fruits are known.

Another of Thouars's species, also sent, Dr. Weber says, by Agassiz and Engelmann, and compared with *C. multangularis* by the latter, he names *C. Thouarsii*. It is described as having cylindrical, channelled stems between 2 and 3 feet long, superposed on one another. The fruit is violet-red, resembling a large Plum, filled with a soft white flesh, mixed with numerous small black seeds, and of an agreeable flavour.

Dr. Weber's third species, *Opuntia myriacantha* (fig. 56), is of more immediate interest, because it is in cultivation in the South of France, and we hope to see it in this country before long. This has a curious history. On returning from Mexico, in 1868, Dr. Weber began investigating the Cactaceæ in the Paris Museum of Natural History, and found, among other things, an untouched package containing the trunk and some detached branches of an *Opuntia*, collected in Charles Island (Galapagos) by a Dr. Néboix, who accompanied Du Petit-Thouars. The same species was found in Albemarle Island by Prof. Agassiz in 1872, and twenty-three years ago Dr. Weber received a living plant from the late Dr. Engelmann. Five years ago it was planted in the garden of Mr. Roland Gosselin, at Nice, and is now between 6 and 7 feet in height. Its peculiar habit will be understood from the figure, made from a reduced photograph given to me for the purpose by Dr. Weber. The following is a condensed translation of his description:—

Branches yellow-green, flattened, obovate, usually 8 to 10 inches long, by 6 to 7 inches broad (sometimes 12 to 14 inches by 8 inches), jointed to each other at right angles or in the same plane, pendulous as the plant increases in size. Reduced scale-like leaves, minute, thick-pointed, of a green-brown colour; areoles smaller and more numerous than in *O. galapageia*, but not woolly, bearing a cluster of yellow bristles about a quarter of an inch long

in their upper part, and in their lower part numerous long, very slender, sharp, deflexed spines of a bright golden-yellow, finally becoming indefinite in number and unequal in length, varying from 1 to 5 inches. Ovary obconical, 2 inches in length, bearing about fifty rhomboid tubercles, confluent in ten spiral series, destitute of wool, and furnished with scales bearing a cluster of stiff, sharp, yellow bristles, with one or two small spines. Sepals numerous, green, obtuse, about one-fifth of an inch broad. Petals pure yellow, clawed, one-third to half an inch broad at the rounded top. Stamens numerous, yellow. Style having nine pale yellow, elongated branches.

This plant of *Opuntia myriacantha* flowered for the first time in August, 1898. The brilliant yellow flowers, which are about 2 inches in diameter, last two days.

I will conclude with a few facts concerning the general composition of the flora. In most of the works treating of "insular floras," the generic endemic element of the flora of the Galapagos has been greatly over-estimated; partly in consequence* of errors in Darwin's statistics, which have been copied by many subsequent writers; partly because the flora of the opposite American coast was not so well known as it is now. When Sir Joseph Hooker worked out Mr. Darwin's botanical collection from the Galapagos, together with the plants collected by previous travellers, now upwards of fifty years ago, he had eight genera which he then regarded as distinct from any known from elsewhere, but subsequent investigations and discoveries have greatly altered the figures as to endemic genera. Indeed there is not one left that presents marked differences from its nearest allies on the American continent, and only two are retained. Five of the supposed peculiar genera belong to the Compositæ. They are *Desmocephalum* and *Microcæcia* = *Elvira*, *Macrea* = *Lipochaeta*, and *Scalesia* and *Lecocarpus* are so near *Mirasolia* and *Melampodium* that the late Mr. Bentham, in his revision of the Order, remarked that they might well be reduced. Of the others, *Galapagoa* (Boraginaceæ), is the same as *Coldenia*; *Dictyocalyx* (Solanaceæ) is *Cacabus*; and *Pleuropetalum* has since been found in several localities on the mainland of America. On the other hand, endemic species of American genera, and genera of wide distribution, are numerous. Prominent among them are bushy Compositæ, and species of such widely spread genera as *Euphorbia*, *Acalypha*, and *Borreria*. Excepting *Rhipsalis* in some of the islands of the Indian Ocean, the Galapagos are the only oceanic or remote islands inhabited by indigenous Cactaceæ. *W. Botting Hemsley.*

ORCHID NOTES AND GLEANINGS.

THE number of the *Lindena*, issued on Feb. 28, contains coloured illustrations and descriptions of the following species and varieties:—

CATTLEYA DOWIANA BATEMAN VAR. *MOORTEBEEKIENSIS*, L. Linden, tab. dclxxxviii.—Lip with a yellow ground thickly striped with deep red, the front part of the lip is rich crimson.

COROLODYNE DAYANA, Rehb. f., tab. dclxxxvii.—Like other Bornean Orchids, this requires the heat of the East Indian-house, with abundance of moisture in the growing season.

DENDROBIUM PRIMULINUM, Lindl., tab. dclxxxvi.—It requires a warm temperature, abundance of light, and plenty of moisture in the growing season. D. Mentor x and D.

* Through some misconception or mistake, he states that there are ten endemic genera out of twelve belonging to the Compositæ.

Rolfea x are named as hybrid derivatives from this species, the other parents being respectively *D. superbum* and *D. nobile*.

MILTONIA CANDIDA, Lindley, tab. dclxxxv.—An old favourite thriving in an intermediate-house with full ventilation. *M. Jolceana* x and *M. leucoglossa* x are considered by M. Linden to be hybrids of some species of this genus.

AMERICAN NOTES.

HYBRID PLUMS.

THE European gardener, I expect, can hardly appreciate how strong is the temptation for the American fruit amateur to try his hand at hybridising the Plums. In order to see more clearly what this temptation is, it is necessary to notice the multiplicity of Plum species cultivated in our gardens. Those which are extensively planted are the European Plum (*Prunus domestica*), in all its forms—Prunes, Gages, Perdrigons, Auberts, &c.; the Damsons (*Prunus domestica* *Damascena*), which also

FIG. 56.—*OPUNTIA MYRIACANTHA* (WEBER), NEARLY 7 FT. HIGH, GROWING IN THE GARDEN OF MR. ROLAND GOSSELIN, AT NICE. NATIVE OF THE GALAPAGOS. (SEE P. 177.)

includes the Bullace; the *Myrobalans* (*Prunus cerasifera*), the Japanese Plums (*P. triflora*), the American Plums (*P. americana* and *P. americana nigra*), the Chicasaw Plums (*P. angustifolia*), and all the so-called Hortulana series, once included under the name *Prunus hortulana*, of which I will speak further in a moment. Besides these, the following species are fairly common in gardens, and are to be found in every hybridiser's collection:—The Beach Plum (*Prunus maritima*), the Apricot Plum (*P. Simoni*), the Pacific Plum (*P. subcordata*), the Sand Plum (*P. angustifolia* Watsoni), and usually several other odds and ends of the genus *Prunus*.

It is necessary, in the second place, to notice the facility with which species of *Prunus* cross. It is now the general understanding that hybridisation in the native woods is common almost anywhere where two species grow and blossom together. This is especially true of *Prunus americana* and *P. angustifolia*. These two species overlap in their distribution through several States of the central Mississippi valley, and here their hybrid progeny

form a great and conglomerate series of the highest interest and importance. This is what may be called the Hortulana series. It was to the more striking members of this group that Professor Bailey first applied the name of *Prunus hortulana*, but further investigation has shown the series to be too much mixed to stand under one species name, even if such a group of hybrids were to be admitted to specific rank. The complications of this group are extremely interesting to the student of hybridity; but there will not be space to discuss them here. Hybrids occur with equal ease where several species are grown together in the orchard; and there is hardly a Plum-orchard to-day in the States which does not contain at least two or three different species. The Japanese Plums combine with others with especial ease, particularly with varieties of the Chicasaw species, and of the Hortulana series. The Japanese varieties also hybridise easily with the Apricot Plum.

In view of these facts, it is not surprising that a large number of Plums of hybrid origin have been introduced to planters through the American nursery trade in recent years. The number named and described is about seventy, of which about half have been privately or commercially distributed. About ten of these have been widely advertised and sold, and two or three have been planted on a commercial scale. As the very oldest of these trees have now hardly borne their virgin crops, it is too early to say what their value is.

Those varieties which, for one reason or another, seem to me to be the most promising or interesting are as follows:

America, <i>Prunus triflora</i> x <i>P. angustifolia</i> .	
Climax, " " x <i>P. Simoni</i> .	
Daisy, " " x <i>P. angustifolia</i> .	
Excelsior, " " x <i>P. angustifolia</i> .	
Golden, " " x <i>P. angustifolia</i> .	
Gonzales, " " x <i>P. hortulana</i> .	
Maynard, " " x <i>P. Simoni</i> .	
Occident, " " x unknown species.	
President, " " x <i>P. Simoni</i> .	
Wickson, " " x <i>P. Simoni</i> .	

The striking thing about this list, of course, is the ubiquity of *Prunus triflora*. It is a fact that every hybrid yet to gain any prominence has partaken of this strain. It is also interesting to note that, with one exception, all the above varieties are from *Prunus angustifolia*, or *P. Simoni*.

If we take those fifty-two varieties whose parentage is known, or may be safely guessed, we have the following showing:—

<i>Prunus domestica</i> , 1.	<i>Prunus americana</i> , 4.
<i>P. cerasifera</i> , 6.	<i>P. angustifolia</i> , 20.
<i>P. triflora</i> , 48.	<i>P. hortulana</i> , 14.
<i>P. Simoni</i> , 13.	<i>P. pumila</i> Besseyi, 1.

The figures given opposite each species' name indicate the number of times the species has participated in a hybridisation. In two of these cases three or four species are combined.

Some of these varieties are remarkable for size, beauty, quality, firmness in shipping, or for other good things; in fact, there is hardly a single good point, so far as can be told at first trial, in which previously known varieties have not been surpassed by some hybrid. No one can doubt but that the results finally must be wide-reaching, and of the greatest moment to pomology. *F. A. Waugh, January, 1900.*

[The illustration on p. 179 of the present issue will afford our readers an idea of the forms of some of these hybrid Plums. Ed.]

THE INTRODUCTION OF THE POTATO INTO ENGLAND.

(Concluded from p. 162.)

Drake — RALEGH. — The traditional belief is that Sir Francis Drake brought both the Potato and Tobacco with him in 1586, and that was the reason for the Tercentenary Exhibition being held in 1886. It was in 1584 that the first expedition was organised by Sir Walter Raleigh, and took possession of the island of Roanoke and part of the mainland adjoining, which in the same autumn was renamed Virginia, in compliment

to the queen, Elizabeth. In the following April his second expedition started to colonise the newly-acquired territory, under the charge of Sir Richard Grenville, the hero of the *Revenge*. He was followed in September by Drake, who sailed from Plymouth, and spent the winter in the West Indies. Christmas was spent at St. Kitts, and on New Year's Day, 1586, he landed in Hispaniola, and took the town of St. Domingo, after which he swooped down on Carthagena, which was ransomed from his clutches for the sum of 110,000 ducats—a heavy price to pay. By May he had arrived off the coast of Florida, and then stood northward to visit the colonists in Virginia. He found them in a sorry

were fastened with a string. Being boiled or sodden they are a very good meate." He also gives similar descriptions of two other roots which he terms Okeopenauk, the size of a man's head, and must be eaten fresh; and Kaishucpenauk, as large as hen's eggs, but neither are esteemed by the natives as the Openauk.

Clusius suggested that this description might apply to the Potato; thus, translated freely from the *Historia*. "In the neighbourhood of Quito, besides Maize, the inhabitants have two other things by which they principally sustain life, namely, Papas, the roots being like tubers (Truffles) without any core or hard husk, which, when cooked, become as

meet with the word Hoppenes, which may be the same word differently transliterated as Hariot's Openauk, and the meaning given is Turnips, Onions, and the like.

This aspect of the question has not escaped the attention of the botanists of the United States. Dr. J. H. Trumbull, an authority on Indian dialects, in conjunction with Professor Asa Gray, published a paper in *Silliman's American Journal of Science*, in 1877, on *Helianthus tuberosus*; in their opinion *H. doronicoides* was the wild ancestor of the cultivated Jerusalem Artichoke, and that Hariot's Kaishucpenauk or Sun-tubers, may have been this. They go on to suggest that the same writer's

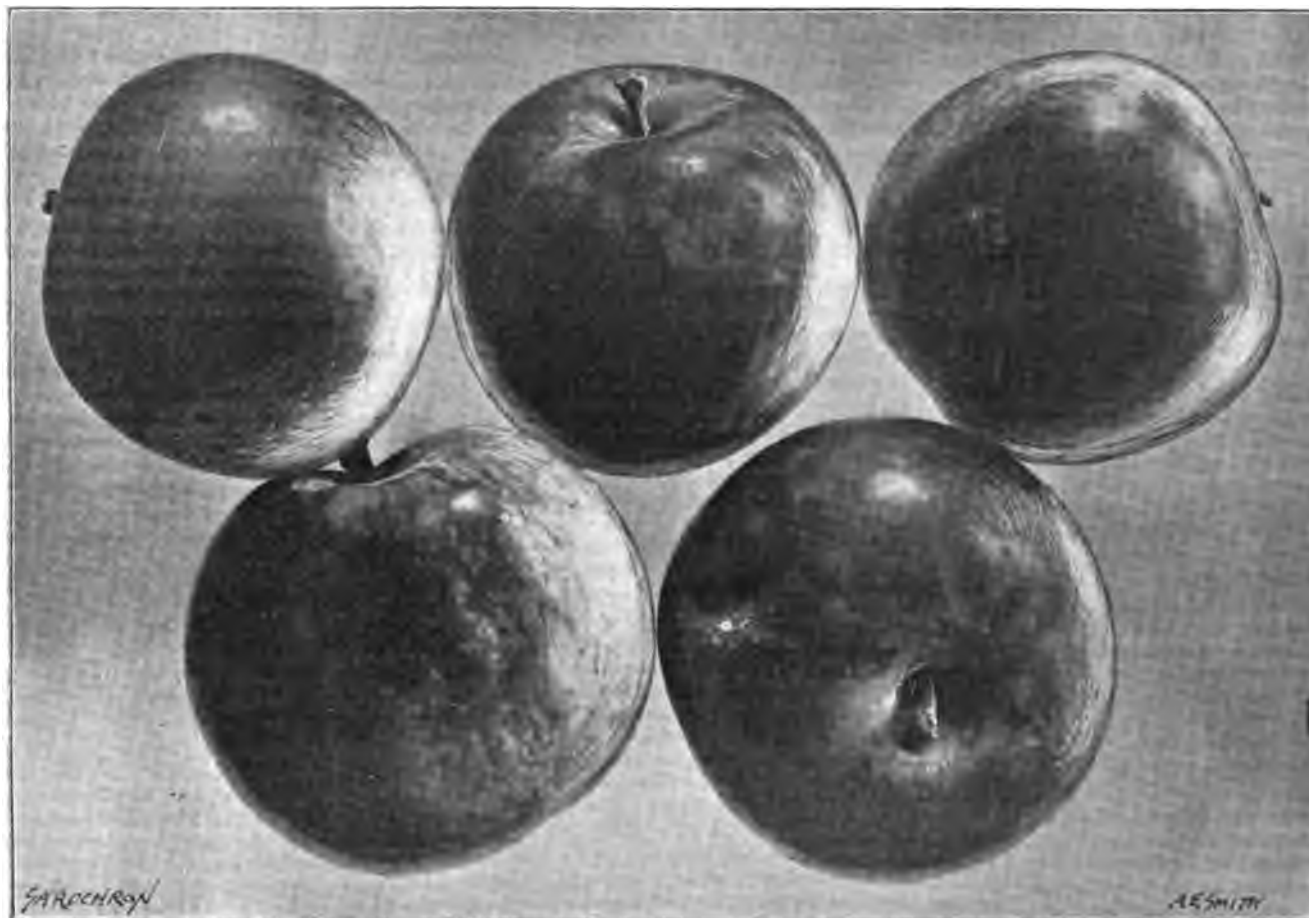

FIG. 57.—SOME AMERICAN HYBRID PLUMS, RAISED BY MR. BURBANK. (SEE P. 178.)

(Photographed, exact size, by Prof. ssor Waugh, Vermont, U.S.A.)

plight, anxiously expecting their relief ship, which had not reached them, and very desirous of quitting their quarters. Accordingly he took the whole colony aboard, including the governor, Ralph Lane, and after a speedy voyage of five weeks he reached his starting place, Plymouth, on July 28, 1586.

HARIOT.

Raleigh's agent, in this ill-starred enterprise, was Thomas Hariot, or Harriott, a mathematician; on his return to this country, he drew up an account of the new regions, and its natural productions and resources, in a work which forms a thin quarto, and was reprinted by De Bry, and Hakluyt, in their collections. In this little work, Hariot begins a chapter thus:—

"Of Rootes. Openauk are a kind of roots of round forme, some of the bignes of Walnuts, some far greater, which are found in moist and marish grounds growing many together in ropes, or as though they

tender as the inside of the Chestnut; dried in the sun they call them Chuno, and store them for use . . . The other is Quinoa (= *Chenopodium Quinoa*, Willd.). . . Agustin Zarate mentions the Papas, as also does Lopez de Gomara in his *Historia General de las Indias*, by whose accounts the roots do not seem very unlike those which the Virginians call Openauk."

From that time till quite recently, Hariot's statement thus started by Clusius, has been held to vouch for the presence of the wild Potato in Virginia, and Gerard has been supposed to have had his plants from Drake, but on somewhat slender grounds. It will be noticed that Hariot in his report speaks of at least two other subterranean esculents, and the names he gives show that the suffix penauk simply means tuber. The vocabularies of the Algonkian languages, drawn up about the time of Hariot's visit, are not full enough to help us much; but in a Swedish narrative we

Okeopenauk may be the *Tubera terre magnæ* of Clayton's *Flora Virginica*, called by some of the early settlers, Tuckahoo, and consequently the *Pachyma Cocos* of Fries, now known to be a sclerotium or hardened mass of fungous hyphæ. In the last place they think the ground-nuts or Openauk so vaguely described by Hariot to be the tubers of *Apios tuberosa*, Moench. Brereton in *Gosnold's Voyage to New England*, 1602, speaks of "great store of ground-nuts in all the Elizabeth Islands, forty together in a string, some of them as big as hens' eggs" (*Purchas*, iv. 1751). The Openauk of Hariot may therefore be referred to that, and unless some entirely new line of information should open up, which seems unlikely, we may consider these productions to be finally identified.

RALEIGH'S LAST EXPEDITION.

But this still leaves the original place of the Potato in doubt. The year 1588 found the entire

fleet of England engaged in repelling the Spanish Armada, and all were too busily engaged in a life and death struggle to organise any colonial enterprise. Raleigh's last expedition to Virginia sailed from England in 1589, to relieve the colony founded in 1587, but which could not be visited in the previous year, for reasons already mentioned. On reaching Virginia, no signs of the colonists were to be found. From this disastrous expedition, it is hardly likely that anything should have been brought home as samples of the produce of a country so fatal to ambitious projects; it was in 1590, therefore, that the last English vessels came back from Virginia, empty-handed, and nothing more was adventured till 1603, which is much too late a date to concern us. Clusius received at least one Virginian root in 1591, from his English correspondent, James Garet; it was *Smilax pseudo-smilax*, Linn., which he records in his *Historia* under the native name of Tsinaw, and figures from his own drawing. This will serve to show how long it sometimes took in those days for a new acquisition to be distributed. Then, too, it was in 1597 that Gerard published the following statement:—

"Of Indian Swallow wort. There groweth in that part of Virginia or Norembega, where our English men dwelled (intending there to erect a colony) a kind of Asclepias, or Swallow wort, which the Savages call Wisanck. . . . It groweth as before is rehearsed in the countries of Norembega, and now called Virginia by the H. sir Walter Raleigh, who hath bestowed great summes of monie in the discoverie thereof, where are dwelling at this present English men, if neither vntimely death by murdering, or pestilence, corrupt aire, bloodie fluxes, or some other mortall sickness hath not destroyed them."

And this was issued nearly eight years after Raleigh returned, as stated above, without having found any traces of his unfortunate countrymen! Could this paragraph have been written carelessly and allowed to stand? If so, it might explain much in Gerard's statements about the origin of his Potatoes.

We have already seen that Clusius first knew of the Potato in 1588, and by that time there was no possible chance of Gerard getting any plant direct from Virginia till long after the publication of his *Herball*. His statement beginning "Since when," &c., seems, therefore, to be absolutely incorrect, and if we acquit him of intentional fraud, he must be held guilty of gross carelessness. Although the Potato could not have been brought from that country, there is the possibility, and even the strong probability, that the original stock came from some captured town or ship. Grenville took two prizes when on his voyage to Virginia. Drake, in the relieving fleet, sacked Carthage, at a time when the cultivation of the Potato had long before reached as far north as New Grenada; and if Drake did really bring the Potato and the Tobacco with him in 1586, it could only have been in this manner.

Objection may possibly be taken to this, inasmuch as Gerard might have received his plant from Clusius, directly, or by way of a friend as the medium. The answer to this is, that Gerard had but few foreign friends, and Clusius was not one of them; then, as the obvious link between Clusius and Gerard was Garet, we have seen above that the Potato did not reach our shores by that channel. A further point which M. Roze indicates is, that Gerard's plant was seemingly a yellow-skinned variety, while Clusius's was as certainly red-skinned; moreover, the two woodcuts, of the *Herball* (fig. 51, p. 163) and the *Historia* (fig. 50, p. 162), are of plainly different varieties. If Clusius did not choose to engrave the figure which Garet sent from London, which must have come from a sister stock, or even from Gerard's own garden, it was because he did not think the drawing resembled his plant sufficiently, and so preferred to have his sketch from the plant grown by him.

CONCLUSIONS

To sum up, Gerard seems to have obtained his plant, if not in 1586, yet very soon after; certainly he could not have openly asserted its Virginian origin unless there had been a strong probability

of his statement being believed, while from 1586 to 1603 there seems no direct channel by which Virginian plants could have reached our shores. On the other hand, there were abundant opportunities of getting produce from the Spanish possessions. Drake, after his eventful voyage which ended in 1580, and the fame of which drew Clusius to this country, was actively engaged in fighting the Spaniards, capturing their vessels, and harrying their towns; it is from this direction that the Potato must have come to us. It is quite conceivable that the Spaniards had become aware of the utility of the tubers at a comparatively early period of their American career; and that their ships, which brought home the treasures of the Spanish possessions, would also bring with them the curiosities. Furthermore, the use of the Potato on board ship as a preventative of scurvy on the protracted voyages of those days, might have been perceived; and if many Spanish vessels carried a stock of these tubers, one at least may very well have fallen into the hands of Drake, whose exploits in Europe and Spanish America had caused his name to be feared and hated by every Spanish merchant and sailor. ALPINE GARDEN.

SAXIFRAGA APICULATA.

WHEN regarded from the decorative point of view, I take this to be the most valuable of the winter-flowering Saxifrages. These are naturally very few, but they are followed quickly by one or two others that perhaps have more claim to be early spring flowering. What is chiefly valued in this plant is its abundant and very early flowering. Quite soon in the month of December some large tufts promised a real display in my garden, which all at once was apparently spoiled by the frosts in that month. In spite of this mishap, they attempted to flower, but this came to nothing by reason of the severe wintry weather. Then for a time the plants were at a standstill, and I feared that a general "blindness" had ensued. In this view I was wrong, for the plants are just now a mass of the pale straw (of the oldest flowers), and the delightful full primrose of the younger or later-expanded flowers. One plant alone carries upwards of eighty of its 3-inch scapes, and as the latter often contains as many as seven or eight flowers each, some idea may be obtained of the real beauty of this dwarf floral carpet. I would not trouble your readers with a note about this well-known plant except to call attention to its beauty, great freedom to flower, and to its thorough hardiness. It is so free in growth, too, that large spaces may quickly be covered with a minimum of care. Chief among its requirements being partial shade, and plenty of moisture at the root in the spring. E. Jenkins, Hampton Hill.

CULTURAL MEMORANDA.

CLERODENDRON BALFOURIANUM.

THE month of March is the latest period at which this species should be pruned and re-potted, and the latter part of February is not too early for plants required to flower betimes. The kind of pruning practised generally should be that known as the spur, and long leading growths should be shortened back to ripe wood. Clerodendrons succeed in a moist stove whilst growing, and should be plunged in a leaf-bed for some few weeks after being started. In re-potting the plant, shake off a large proportion of the exhausted soil, then cut back somewhat the strongest roots. Employ a clean, well-drained pot of any size up to 18 inches in diameter. The potting compost may consist of fibrous peat, loam, and one-eighth of the whole of rotten, dry cow-dung in equal proportion, together with silver-sand, bone-meal, and charcoal broken finely.

Established plants are benefited by being afforded farmyard liquid, alternately with clear rain-water. A temperature of 60° by night, and 70° to 80° by day, may be afforded, fresh air being freely admitted in mild and warm weather. About midsummer the plants should be placed in the intermediate-house, or even in a cool conservatory. The treatment of the shrubby species of *Clerodendron* is similar to the above as regards resting, pruning, &c., but being more robust growers, more loam should be used in the potting soil, and the pruning should be severer. If large specimens of *C. fallax*, *C. Bethunianum*, *C. hastatum*, and *C. paniculatum* are required, plants of one to two years old should be placed to the number of four or five in a 12-inch pot, and grown on without dividing them.

These species may be propagated from cuttings taken with a heel, and by seed, which, if struck or sown in January, will flower in the autumn of the same year.

The climbing species may be raised from cuttings of matured shoots inserted in the autumn, or some of the younger strong shoots may be taken off with a heel when they are 3 inches in length, and inserted in pots filled with sandy soil, which should be plunged in a bottom-heat bed. H. T. Martin, Stoneleigh.

CENTROPOGON LUCYANUS.

This useful winter-flowering plant is a hybrid raised in 1856, by M. Desponde, of Marseilles, between *C. fastuosum* and *Siphocampylus betulaefolius*. Although strictly speaking, not a cool house plant, it may be transferred to the cool conservatory when in flower, and will then remain in full beauty for a considerable time. Cuttings struck in February and March afford plants which will flower towards the end of the month of November, and by taking cuttings at various times, plants may be had in flower throughout the months of December and January. So soon as its beauty is past, the plant should be cut back, when new shoots will form, which may be taken off and prepared as cuttings. The cuttings should be placed several together in 6-inch pots filled with light, sandy soil, and plunged in a bottom-heat bed in the propagating pit. When rooted, pot them off in small 60's, and shift on till they come into pots of 6 inches diameter, in which they may flower. The best kind of soil is one that consists of loam, peat, and silver sand. During the spring months, the intermediate house is a suitable place for the plants, but after the final potting a gradual inuring to a cooler temperature should be adopted throughout, and cold frame treatment afforded throughout the summer.

On the approach of cold weather, return the plants to the intermediate house. Water should be freely afforded during the season of active growth, but in the months from October onwards, it should be applied in much less quantity, or the lower leaves will become disfigured and fall off. H. H. T.

EARLY FRENCH BEANS.

In my earlier note on the forcing of French Beans in midwinter, I casually touched upon the poorness of the returns as compared with the outlay, but at this season there need be no apprehension as to cropping if timely shelter be afforded the plants at the start. In early spring there is never any great choice in the matter of vegetables, and the earlier that French Beans can be obtained, the greater their appreciation when brought to table. From the month of March to the middle of the next is a suitable season for sowing, a quick-podding variety being chosen, and one that is a robust but not a tall grower. I have grown Veitch's Early Favourite as a first crop, a dwarf and remarkably early variety, in preference to Ne Plus Ultra, Sutton's Forcing, and Sir J. Paxton, which are lacking in robustness, although they are excellent for furnishing early forced Beans.

At Syon the first sowing is made in the third week in March, and the plants are put out in the borders in the last week of April, weather

permitting. Nothing is gained by sowing earlier, the plants becoming leggy, and less able to bear the vicissitudes of the weather. We sow in pots filled with a light sort of soil, and place in cold frames, and make use of sun-heat as much as possible from the time of sowing till germination is perfect; keeping the frames close by day and night, and protecting at night with mats and litter.

From six to nine seeds are put into each pot, and the plants are reduced to four or five of the strongest. If the soil was moist at the time of sowing the seeds, no water will be needed till germination has taken place, and very little then for the first few days. There should be no coddling of the plants, and air should be afforded night and day for a few days before the plants are planted out of doors. As places in which to plant these early Beans, the Vine-borders and the space between the Peach-trees at the foot of south walls

development, in some degree of the nature which is now generally described by peloria. The chief evidence of this abnormality consists in the presence on each of the petals of a small white hook-like process (shown in the illustration), which would represent a portion of a rudimentary callus. It is a singular, bizarre-looking flower, the white sepals faintly tinged with yellow, being those of a typical *O. crispum*, while the petals and lip are slightly harder in texture, and rolled back at the edges. The chief characteristic is in the colouring of the petals, the greater part of whose surface is covered with a bright brownish-red tint, a few spots of the same colour also decorating the tips, though they are not visible when viewing the flower from the front. The spotting on the tips of the petals is visible, however, on the reverse side; the surface colour of the body of the petals also faintly shows through. The lip, which is rather

FIG. 58.—*ODONTOGLOSSUM CRISPUM* "OAKFIELD SUNRISE."

are excellent. The plants are put out in deep drills which are not quite filled in, as thereby the wind is warded off till such time as they have grown stronger. If some fine soil can be spared to cover the roots, it is an advantage; and portable protection of some kind is another, and it may consist of frame-lights, hand-glasses, thatched-hurdles, canvas, &c., put over the plants nightly. Pickings from these plants can be obtained three weeks earlier than is possible by sowings made in the open ground in the usual manner. *G. Wythes*.

ODONTOGLOSSUM CRISPUM "OAKFIELD SUNRISE."

OUR illustration (fig. 58) gives a representation of a very remarkable *Odontoglossum*, exhibited by Thos. Baxter, Esq., Oakfield, Morecambe (gr., Mr. R. Roberts), at the meeting of the Royal Horticultural Society, March 13, as *O. crispum Surprise*, the name being afterwards changed to *O. c. Oakfield Sunrise*, as it was found that the former name had been previously used. The whole arrangement of the flower and its colouring seem to indicate abnormal

narrow, is marked at the base with some lines of a reddish-brown tint, and small blotches of the same colour are noted on each side of the blade, which has a notched margin. The flowers exhibit a very extraordinary variation, the like of which has not been observed previously. It will be interesting to learn whether the peculiarities observed remain constant or otherwise. The plant received an Award of Merit.

NOTES ON SOME PHASES IN TOMATO CULTIVATION.

(Concluded from p. 149.)

MANURING.—This important item in the cultivation of the Tomato I do not think has received among growers for market the careful attention it deserves. After so many years' experience in the cultivation of the plant on a large scale, it is astonishing to find at the present time so many instances of the excessive use of crude, unpurified manures which too often produce the most disastrous results. On the Sussex littoral, where probably there are more Tomatoes produced than

in any other county of England, the soil, generally speaking, is a deep, unctuous loam, requiring but little manure for any crop, and least of all that of the Tomato; and yet we find at the present time not a few market growers actually using crude manure fresh from the London stables in their Tomato-houses at the rate of from 80 to 90 tons per acre, and subsequently expressing wonder and surprise when a coarse, rank growth is the result, frequently accompanied by disease, and by the plants' refusal to "set," what is called locally the bottom trusses, which are always the heaviest and best when obtained under good cultivation.

As a matter of fact, the Tomato-plant is extremely fastidious in the way of food, and impatient of any manure of a crude or unpurified nature, showing its dislike to such a form of nutrition by an unnatural growth, the shedding of its flowers on the lower nodes, and the want of power to resist disease in its various forms. Besides all this, when too much manure is applied, the fruit is wanting in that firmness and delicate flavour so much prized. Rather would I refrain from giving manure of any kind in the cultivation of the Tomato plant than I would apply that, even in small quantities, of a foul and offensive nature, as I have frequently seen done.

In support of my position, I may state that I could name a grower of the Tomato plant under glass in Sussex who, to my certain knowledge, has for the past seven years grown very fine crops of fruit in the same houses without any renewal of soil whatever, with very little manure, and absolutely without disease of any kind in the plants; the latter fact being, I am convinced, due to his system of cultivation, which may be described briefly as follows:—The ground is simply forked over in the usual way (not trenched), after a thin coating of spent Mushroom-manure and some well-sweetened road-grit has been spread over the surface. The plants from 48-sized pots are planted, watering, and the removal of suckers is attended to, and nothing more is done till the plants set their "bottom trusses" which invariably happens under the above treatment. When the fruit obtains a goodly size, and faint indications of ripening set in, then, and not till then, liquid manure of some kind is applied as a stimulant, moderately, and not oftener than once in eight days. This may take the form of liquid from the soaking of animal manures, soot-water, or artificial stimulants, Canary Island guano being a favourite. In the instance mentioned I have, for the past seven seasons, had personal opportunities of seeing the excellent results of the above mode of cultivation, the crops of fruit being all that could possibly be desired.

There are very many cultivators, I am aware, who utterly ignore spent Mushroom-manure as a fertiliser, and who would rather pay high prices for the crude and unpurified material than use one particle of it. Yet in the same breath that they inform you it is of no utility whatever in general cultivation, they are careful to add that it is "very good for potting purposes." I confess that it has always puzzled me to find out why it should be such an excellent thing for pot plants, and the reverse for Cabbages and Cauliflowers. I once ruined a crop of outdoor Tomatoes by giving the plants an overdose of Mushroom-manure, the result being any quantity of leaves and stem, but very little fruit. I have grown Celery of excellent size and quality, and indeed many other kinds of vegetables with nothing but spent Mushroom-manure.

On lighter soils than what I might term the Tomato zone of Sussex, more manure may be used with possible advantage, but even on the lightest soils I would not recommend the use of heavy dressings before digging and planting.

RIPENING OF PARTLY COLOURED AND GREEN FRUIT IN LATE AUTUMN.

Loss, to a considerable extent, is frequently incurred by the refusal of green fruit to colour and ripen on the plants in late autumn, and not in

frequently the plants are completely denuded of leaves with the object of exposing the fruit to the rays of the sun, and thus assist Nature in bringing the fruit to maturity. The more common method, however, is to strip the plants of all fruit, green and partly coloured alike, and expose them to the sunlight in shallow trays in houses close under the glass. The average English summer, be it ever so fine, comes to an abrupt and sudden termination, and the grower anxious to save as much of his crop as possible, adopts one or other of the two methods named above. Both these methods are, I venture to think, faulty and tend to shrivelling, thickening of the skin, and general unwholesomeness of the fruit.

Although counter to the generally accepted theory that sunlight is absolutely necessary to the ripening of most kinds of fruits, my experience teaches me that the best way to ripen immature Tomatos is, after gathering, to keep them altogether in the dark, in trays, in some warm and comfortable position where the day and night temperature is, as near as possible, equal. By this treatment they will be found to ripen quicker, obtain a better colour, and the loss of nutritive qualities is reduced to a minimum. Even in an ordinary way, during summer, immature Tomatos will be found to develop, after gathering, a much plumper and richer appearance if kept absolutely in the dark, than when exposed to the rays of the sun. In late autumn and early winter it is simply foolish to expect the immature fruit to develop any degree of wholesome ripeness if exposed in trays on shelves close to the glass, with a house-temperature ranging perhaps between 20° and 30°. It may be urged that heat could easily be applied during the night or in cold weather, but this, I have found, does not compensate for the damage done by exposure to sunlight, which seems to me to eat all goodness out of the fruit.

In late autumn, when unheated Tomato-houses are not urgently required for other purposes, I have found it an even better plan than the above to allow, as cool, cloudy weather approaches, instead of pulling up the plants, the laterals to "run." In a short time the glass will be quite obscured with a dense mass of foliage, quite capable of keeping out several degrees of frost, and maintaining a more equable temperature in the house. Ripening under these conditions will be found to go on far into the winter, slowly, it is true, but steadily, and without the loss in the fruit of those qualities so essential to its wholesomeness.

With reference to the ripening of fruit in the dark, I may be allowed to mention rather a curious fact with regard to the ripening of the Banana-fruit by the natives of India. They never allow the fruit to ripen on the plant, but invariably cut the bunches in a fully-developed but perfectly green state, and then suspend them, not out-of-doors in the sunshine, but in the shade and darkness of their verandahs and rooms, where they develop a rich colour and fine flavour. Removing wholesale the leaves of the Tomato-plant in all stages of its growth, although not so much practiced now as some few years ago, with a view of accelerating the ripening of the fruit by exposure, is, I think, a fatal mistake, superinducing disease, robbing the plant of its lungs, and retarding instead of hastening the ripening of the fruit.

PRUNING.

This is a very simple process, consisting merely in topping and removing side-shoots or suckers. In high-roofed Tomato-houses, I think that the plants are frequently allowed to attain too great a height, which results in a large quantity of fruit being found, when the late autumn arrives, on the tops of the stems, about the size of marbles, which by no treatment can be induced to swell and ripen, and which have only served the purpose of robbing the more developed fruit lower down of nourishment they ought to have had.

As to whether the plants should be allowed to

develop two or more fruiting shoots, or kept to a single stem, I consider this question has been clearly and finally answered by Mr. E. H. Jenkins, on p. 196 of the *Gardeners' Chronicle*, and I think it applies to outdoor as well as indoor cultivation. In outdoor culture, I cannot help thinking that it is a mistake attempting to get a large crop by allowing the plants to attain too great a height; rather would I be content with two bunches per plant than run the risk of retarding ripening by allowing three or four to remain.

In conclusion, I would beg to offer the following items of advice to beginners in the art of Tomato-growing in the open:—

1. Beware of an overdose of manure, especially if unpurified.
2. Plant nothing but strong plants, and as early as possible.
3. Keep the plants to one stem, and be content with not more than two or three bunches of fruit to a plant.
4. On no account remove the leaves from the plants during any stage of their growth.
5. Plant at wide distances apart, so as to admit plenty of air and light. *J. Lowrie.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Re-potting Cattleyas.—No operation in the cultivation of Orchids needs to be performed with greater skill than the re-potting of established Cattleyas. The removal of the plants from the old receptacles is a work of extreme difficulty, owing to the clinging character of the roots; and in cases where it is desirable to transfer the plants to receptacles of lesser capacity, the difficulty is increased. I believe that the operation may be done advantageously in winter or summer, but a time should be chosen when new roots are about to be made from the base of the last-made pseudo-bulbs.

Suitable Receptacles are numerous and varied in shape and substance, but ordinary pots, pans, and teak-wood baskets, I consider can be used with great success. Baskets, whether of the pot or ordinary shape, give the best results until the plants have spread beyond their limit. Thereafter difficulties arise which it is not easy to overcome, for the roots of the plants, and the bars of the basket, have become united, that to extract the plant without serious damage resulting, is an utter impossibility, and to insert the basket bodily into another one of larger size is very unwise. Therefore, I prefer earthenware pots or pans, which may be broken, and some of the pieces removed before inserting the remainder in a new one. The old receptacles in this case become an aid to drainage. Receptacles that need a considerable amount of rooting material should be provided with perforations at the side near the base to admit air, and allow of the rapid exit of water. One of the best pans that has come under my notice is "Sander's Perfect Orchid-pan," the base of which is like that of a champagne-bottle, with numerous apertures. These do not need a large quantity of drainage material, and are light for suspending.

Potting Material.—Although various so-called substitutes for Orchid-peat have been tried, I know of none that is an unqualified success in England, and except as an experiment, nothing but peat and sphagnum-moss should be used as a rooting medium, beyond the necessary drainage material. The peat should be freed from most of the thick rhizomes of bracken, and from as much of the fine particles as will pass through a fine mesh sieve. The rhizomes may be worked in immediately above the drainage in the case of large specimens, but none should protrude through the surface, as they would give an untidy appearance. Use two parts of peat to one of sphagnum-moss. For small plants the ingredients may be mixed before use, but for others they are best used separately, so that the peat may remain as lumpy as is necessary.

How to Pot.—Allow the plants to become dry, so that the old material may be picked out readily, and that their condition may be known when completed. Remove as much of the old material

as possible, crack the pot where no adhering roots are present outside, and remove a piece here and there, and so insert the ball in a new receptacle, that the growing base is raised well above the pot. Insert sufficient crooks in an upright position to fill the desired space, and pack in the peat and sphagnum-moss to the depth of an inch and a half.

Subsequent treatment.—Afford water sparingly until new roots have pushed well into the material. At this season, and all through the summer, shade and atmospheric moisture should be increased for a short time after this operation.

FRUITS UNDER GLASS.

By J. ROBERTS, Gardener to the Duke of Portland, Welbeck Abbey, Worksop.

Vines.—In the earliest house, where the Vines have reached full-leaf development, and the fruit has been thinned, liberal applications of liquid-manure will be needed, and any approach to dryness at the roots must be carefully avoided, as ill-nourished Vines become liable to red-spider, scorching, shanking, &c. Maintain equable atmospheric moisture by damping down the surfaces in the house at sunrise, and in early afternoon, or closing time. At sunset the top ventilators may be opened 1 inch for the night. Houses containing Vines at the flowering stage may now be kept 65° at night and 70° by day, and be given slight ventilation day and night until the setting is completed. Muscat varieties will require a temperature 5° higher than these figures. The flowers should be carefully fertilised about mid-day, first removing any capsules that adhere to the stigmas, which is very common in the variety Canon Hall Muscat. Vines that have just reached the thinning stage should be given early and daily attention, thinning first the earliest bunches, and following them up to a finish. Large and unshapely bunches should be trimmed into good shape before the berries have weighed them down. Such pruning of the ugly shoulders, &c., will be amply repaid in finer berries, and a more uniform excellence throughout the house. Later houses, in which the Vines are just breaking, will require attention to disbudding, but this should not be done very liberally, until it can be decided which will make the finest bunches. Syringe the rods twice a day, and keep a genial atmosphere. If the house be occasionally damped down with clear soot-water, this will give off a little ammonia, which will benefit the young growth. A night temperature of 50° to 55°, and 60° by day, with an increase of 10° from sun-heat, will be sufficient. Let the Vines be ventilated freely by day when the weather is favourable. Where the roots of late Vines are in outside borders, these should be given a liberal dressing of bone-meal, burnt-ash, and nitrate of soda, forking the whole lightly into the border, covering the whole with fresh stable-dung.

THE FLOWER GARDEN.

By J. BEXBOW, Gardener to the Earl of Ilchester, Abbotbury Castle, Dorset.

Delayed Operations.—In many parts the wet state of the soil has hindered the work in the flower-garden, but the potting up bedding plants, cleaning of pots, pans, boxes, &c., the preparation of flower-stakes, and the needful propagation of plants, will have received timely attention. Advantage should be taken of fine weather for getting on with out-of-doors work, such as that of finishing the pointing over of the soil of the shrubberies. [Never dig the land deeply. ED.] Shrubs may still be planted, and in the case of deciduous species there should be no delay in doing this. To delay planting, excepting in the case of Hollies and Conifers, is to invite much labour and expense in the matters of syringing the heads, and affording water to the roots during the summer months. Let everything newly planted be securely fastened to stakes, or by means of guying-wires; and the space, often to be found after wind-rocking round the bases of the stems, filled up firmly with heavy loam.

Spring Bedding Plants and Bulbs.—All the spring flowers will benefit if the surface of the beds be lightly hoed, or stirred with a handfork, taking care in doing it not to injure the roots, but using a new rake instead if there is any risk of this occurring. Plants of the Carnation, Wallflower, Myosotis, Silene, Viola, and alpine Auricula, should first have the soil pressed firmly around them by the hand in order to prevent loss of plants, and the con-

sequent disfigurement of the beds. If the soil is not rich in plant food, apply bone-meal, or some of the so-called guanos, which are quicker in action than bone-meal before the beds are hoed. After the hoeing, &c., is finished, let the soil be made smooth and level with an iron rake.

The Trimming of Ivy.—Ivy on walls and trellises may now be safely cut back severely with a sickle, or in the case of Ivy that has not been pruned for some years, the *secateur* may be required. The fore-right shoots should be cut back close to the old stems and branches. If Ivy branches have broken away from a wall, strong wall-hooks should be freely used in refixing them to it. By pruning at this date, only a short period elapses before new growth covers the naked branches. Specimen Ivies grown as bushes or standards, and that growing over the stumps of trees should also come in for a careful pruning, misplaced shoots being cut back to a point where the wound is hidden by the foliage.

Pæony Culture.—The shrubby species should now be planted, if good floral results be looked for in the current year. Herbaceous species and varieties need a rich soil deeply dug, so as to ensure the necessary vigour. The plants succeed in strong fibrous-loam well enriched with decayed cow-dung. Pæonies have an advantage over many other species of plants, in that they will thrive and blossom in partial shade. Hence they may have plots allotted to them in out-of-the-way places, and shady parts of the shrubbery or the garden woodland. In such places the stations should be roomy, and free from the roots of timber trees and big shrubs. If a succession of flowers be required, let them be planted 3 feet apart, and cover the ground with *Megasea cordata* edged with *Cerastium tomentosum*; or plant the corms of *Gladiolus*, marking the site of each Pæony and *Gladiolus*, and thus prevent the crowns being injured when the soil is hoed.

THE HARDY FRUIT GARDEN.

By A. WARD, Gardener, Stoke Edith Park, Hereford.

Grafting may be commenced in the warmer parts of the country, as the sap has now become active. The practice of grafting is a ready means of effecting quick propagation of any particular or new variety of the Apple, Pear, Plum, or Cherry, although in the two last-named cases budding is now more largely employed. Some varieties of Pears need to be worked a second time, as they do not succeed perfectly when first grafted upon either Pear or Quince stock. Strong-growing Pears, such as *Beurré Bachelier*, *B. Bosc*, or *B. d'Amanlis*, form the best stocks with which to experiment in respect to the double grafting of Pears; and speaking from personal experience, their adoption results in a vast improvement both in growth and in the flavour of the fruit. Grafting is also of the greatest utility in country districts for converting orchard-trees that produce worthless crops of fruit, or which bear but indifferently, into more profitable specimens in a comparatively short space of time. If such trees are healthy and vigorous, regrafting them with the best sorts is more profitable than cutting them down would be, as they are capable of bearing crops in a very much shorter time.

Varieties to Graft.—If it is intended to cultivate fruit for the market, only scions from such varieties as are known to succeed in the district should be made use of. Such varieties as Lord Suffield, Lord Grosvenor, Ecklinville, King of the Pippins, Lord Derby, Cox's Pomona, Lady Henniker, Wellington, Tyler's Kernel, Warner's King, Worcester Pearmain, Stirling Castle, and New Northern Greening succeed in most fruit-growing districts. They are all free croppers, and the fruits sell readily. Blenheim Orange is a longer time before coming into bearing, but once established it bears well. Such attractive varieties as Gascoigne's Seedling, Beauman's Reinette, Peasegood's Nonsuch, and others, may be increased in situations where they succeed, as the fruits command good prices. For a private garden most of the choicer varieties should be included.

Preparations for the Work.—Where there are but a few stocks to be grafted, clay may be employed for excluding air and moisture from the scions; but otherwise grafting-wax will be the best material to use, as this not only effectually encloses the scion, but needs no after attention. Grafting-wax can be bought ready for use, or it may be made at home, the latter being the cheapest course if a large quantity is required. If clay is to be used

it should be well kneaded beforehand, and a little chaff mixed with it, which, in a measure, will prevent the clay from cracking and falling off. Until required for use the clay should be kept covered up to prevent it becoming dry. Just before actual grafting begins, the stocks and trees should be cut back to where it is desired to insert the scions, and the wounds made smooth with a sharp knife. If there is much grafting to be done, a second person or a lad should follow to perform the claying or waxing as the case may be.

Methods of grafting.—Whip-grafting is the method generally adopted in gardens, and crown and wedge-grafting for orchard-trees. There are also several other methods which the exigencies of space will not permit me to describe here. A sharp knife is needed for preparing both scions and stocks, and whichever method of grafting be adopted, it should be done expeditiously, and care

FIG. 60.—
WHIP-GRAFTING.

taken to see that the bark of the scion and that of the stock correspond, at least, on one side, as future success will depend entirely on the observance of these rules.

THE KITCHEN GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Potatoes.—For affording an early supply, some sets of early cropping varieties may now be planted on warm borders, the soil of which was dug or bastard-trenched two months or longer ago. In planting the border, deep drills should be drawn at 2 feet apart, the sets being dropped at a distance of 1 foot apart, and about 6 inches below the ground-level, the drills being filled in with the feet or a broad draw-hoe. The sets are best when of middle size, and with the eyes just pushing forth. Veitch's Early Ashleaf, Ringleader, and Sharpe's Victor are excellent earlies, of a dwarf and compact style of growth.

Potatoes in frames.—If the tops are strong, and they have reached nearly to the glass-lights, earthing up may be carried out, but as the roots are near to the surface of the beds, it is prudent to add more soil to the bed than to mould up with what can be obtained by scraping the surface. The added soil should consist of light loam and sifted leaf-mould. This done, the haulm should be pressed down, and the bed afforded a light sprinkling of water, which may be repeated occasionally.

Spear Mint.—In most soils it is advisable to make a new plantation of this pot-herb once in three

years. The plot to be planted, which should be in good heart and not recently manured, should be trenched 2 spits deep, and when in workable condition it should be levelled with the spade and finished off with the rake. A part of the old Mint-bed should then be dug up, and strong shoots with roots attached taken which should be dibbled in about 1 foot apart. If the weather be dry at the time of planting, water should be afforded, and its use continued till the plants are established. The old bed of Mint should not be destroyed till the new one has become productive. A Mint-bed two years old will be benefited by an application of fine, rich mould to the surface.

Tarragon.—This plant rarely survives a very hard winter unless planted under fruit-trees, and it always exhausts the soil quickly, requiring to be replanted almost annually. The roots should be lifted before winter sets in, and boxed or otherwise protected, and late in February these roots should be placed in cold frames, and when strong cuttings are obtainable, these should be taken and struck under hand-lights. When the cuttings are well rooted, plant them out in rows 18 inches apart in soil that has not been recently manured, but which is well drained, and of a light nature. Slugs, being partial to the young shoots, must be sought out and killed. There are two kinds of Tarragon, the one with tall coarse growth and narrow leaves, the other of dwarfier growth, with fewer leaves and a more aromatic flavour.

Beans, French.—A sowing should now be made to succeed those under pot-culture. Disused hot-bed frames may be utilised after removing the old soil, &c., and affording instead a compost consisting of equal parts of loam, leaf-mould, old mortar rubbish, and some half-inch bones, to a depth of 6 inches, and brought up to about 14 inches from the glass. The frame should be kept close till the fresh soil is warmed throughout, when the seed may be sown (dibbled) 12 inches apart, 2 inches deep, leaving 18 inches between each row. Canadian Wonder is a good variety for frame culture.

PLANTS UNDER GLASS.

By T. EDWARDS, Foreman, Royal Plant Gardens, Frogmore.

Begonias with Fibrous Roots.—As soon as flowering is past, the repotting and raising of a stock of plants for winter-flowering should receive attention. Plants of *B. manicata*, if not too large, should be repotted, using as a potting compost fibrous loam two parts, and leaf-mould one part, and enough sand to give porosity, continuing to grow the plant in heat. If the number of plants of this species is to be increased, cuttings may be taken at this season, these making nice plants in one season. For ordinary purposes of decoration, 5-inch pots are sufficiently large. Select medium-sized shoots, about 4 inches in length, remove two or three of the lower leaves, and cut across below a joint with a sharp knife, taking care not to bruise the stem or leaves. *B. hydrocotylifolia* should be propagated annually by means of rooted portions of the rhizomes, or from stem cuttings. When they have filled the small pots in which the cuttings were placed singly, repot them in 9-inch pots, and at this potting make use of some strong loam in the compost. When well established, place the plants in warm pits from which the artificial heat is shut off in July, August, and September. *B. nitida* should be struck from cuttings annually, and afforded a like treatment to the preceding species. If a suitable place on the wall of a plant-stove can be found them, the plants will, if planted in a border, furnish quantities of flowers for cutting purposes. *B. insignis*, *B. Haageana*, *B. Knowsleyana*, and *B. Weltoniensis*, require a lighter compost than the foregoing, and to be placed finally in pots not larger than 4½" and 3½". No time should be lost in putting in leaves or cuttings—leaves by preference of *B. Gloire de Lorraine*, while fresh; if deferred, the leaves do not root so readily. The cutting-pans or pots should be filled with a mixture of equal parts, peat, sand, and chopped sphagnum-moss; which should be afforded water, and the cuttings placed edgewise about an inch apart, so that the leaves rest upon the soil. The pans, &c., should be plunged to the rim in a hot-bed-frame, and the syringe frequently applied lightly over the foliage. This variety likes a place on a shelf in the hotter part of the stove. Its habit and freedom to flower fit it admirably for planting in hanging baskets.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, MARCH 27 { Royal Horticultural Society's Committees.

SALES.

MONDAY, MAR. 26.—Roses, Greenhouse Plants, Carnations, Hardy Perennials, &c., at Protheroe & Morris' Rooms.

WEDNESDAY, MAR. 28.—Japanese Lilies, Ornamental and Decorative Plants, Spiræas, Roses, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.

THURSDAY, MAR. 29.—Clearance Sale of Glass Erections, Piping, Roses, Fruit Stock, and other Stock and Sundries. By order of the executrix of the late Lord Penzance, by Protheroe & Morris.

FRIDAY, MAR. 30.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—44°5'.

ACTUAL TEMPERATURES:—

LONDON.—March 21 (6 P.M.): Max. 49°; Min. 33°.

March 22.—Cold wind; dull.

PROVINCES.—March 21 (6 P.M.): Max. 47°, Cornwall and S. Ireland; Min., 38°, N.E. Scotland.

The Manuring of Grass Land.

No more remarkable sight, in its way, can be seen than the experimental grass-plots at Rothamsted a little before the hay is cut. Band after band of varied colours—shades of green, blue, and yellow are presented, according to the nature and amount of the manure employed, and in response to the character of the season. For forty-four years these experiments have been carried out on a uniform plan, about seven acres of ground being devoted to the purpose. Hundreds of chemical analyses of the ash of the plants, more or less complete, have been made, together with similar analyses of the soil at varying depths. As it was soon observed that the plant-population of the plots varied greatly according to the nature of the manure employed, botanical censuses of each plot were taken, some partial, others as complete as they could be made, every little fragment of grass, or leguminous plant, or whatever it might be, being picked out of a carefully-prepared sample, so that it became possible not only to count the number of species, but also to determine the proportion in which each species existed on each plot. The records of so vast a series of experiments are necessarily extremely voluminous, but Sir JOHN LAWES and Sir HENRY GILBERT, nothing daunted by what other people would think overwhelming, are engaged in tabulating the results, summarising them and drawing inferences from them.

The agricultural results were dealt with in 1879, the botanical results in 1880, and now we have in the *Philosophical Transactions of the Royal Society*, vol. 192 (1900), p. 139, the first part of the chemical results. The chemical composition of the ash is found, as might have been anticipated, to depend not only on the soil and its contents, but notably on the nature and proportion of the plants growing on the plots. The details and tables are much too extensive to be properly discussed here. There are, however, certain points of great interest to cultivators generally to which we may make

passing allusion. In the unmanured plots the number of species is much the greatest (about forty-eight), the struggle for life is greatest, and there is no marked predominance of one family of plants over another.

Under the influence of various manures some species are driven out more or less completely, and the others, no longer subjected to such severe competition, attain the upper hand. Thus, in some of the plots where nitrogenous-manures and mineral-manures are used in combination, the number of species is reduced to nineteen, or even fifteen, but in all these cases the percentage of grassy herbage is very high, in one case over ninety-six per cent. of grassy herbage was noted, while the leguminous and weedy herbage was actually and proportionately diminished.

The condition of the plant is also greatly affected—under the influence of some manures a great relative tendency to the formation of woody stem and toward the early ripening of the seed is observable, whilst in others it is the foliage which is specially encouraged. The influence of season is shown in the case of Wheat. It is shown that the composition of the grain may vary much more when grown in different seasons with the same manure than when grown under the influence of very different manures in the same season. "The composition of the entire plant reflects, more or less closely, the supplies at its command, but the final product—the seed—has a fairly uniform composition, while the composition of the straw varies, within wide limits, according to the supply."

Nitrogenous-manures greatly increase the actual and proportionate amounts of the grasses, and if used in excessive quantities, the herbage will be characteristically leafy, and of an abnormally dark green colour, there being an abnormally high proportion of nitrogen in the dry substance. If, with the nitrogen, a plentiful supply of mineral constituents, especially potash, be afforded, the herbage will develop much stem, and show much tendency to flowering, seeding, and ripening.

Turning to the result of the analyses of the separated gramineous, leguminous, and miscellaneous herbage, we are told that the ash of the grasses contains much silica, comparatively little lime, much potash, and but little carbonic acid. The leguminous herbage contains scarcely any silica, much lime, relatively little potash, but a large amount of carbonic acid, representing probably some more complex organic acid destroyed in burning the ash. The miscellaneous weedy herbage contains little silica, lime, or potash, but a considerable amount of carbonic acid.

Potash and some other bases, whose office is not definitely known, are not only concerned in the formation of carbo-hydrates (starch, &c.), but they are carriers of nitric acid, so that a large proportion of the nitrogen of plants is derived from nitrates. Here we must leave the subject for the present, referring the reader to the original paper for details and inferences, for which we cannot now afford further space.

We have said enough to show how greatly these researches bear on the cultivation of plants, and the application of appropriate manures in suitable quantities.

THE following letter from the Director of the Royal Gardens, Kew, relating to the List referred to in our last issue, will be read with great interest:—

"I am glad to find that the *Gardeners' Chronicle* confirms my belief that the publica-

tion of a synoptic list of the published names of garden plants will be acceptable to the horticultural world. Its preparation was prompted in the first instance by our own necessities. Those who now have the opportunity of using it have to thank the Government for enabling me to place it at their disposal. As it has been received so sympathetically, I should like to give a few explanations.

1. I regret that it could not be issued at a cheaper price; but I need hardly say that there is no money in it. The Stationery Office inform me that the printing was expensive, as it was unusual work for Government printers. The price charged merely covers the cost of paper and printing.

2. The work of compilation has been done at odd times by the staff of my office. It may be interesting to mention that the tedious work of sorting the slips, which were of course far more numerous than the names, was done during a spell of bad weather by our women gardeners.

3. The list has no pretention to any scientific value; it is a mere index to garden literature. Everyone who has attempted to study a group of plants, either in the study or the garden, was liable to be haunted by floating names not readily to be run down. The search for the original publication of these is usually exasperating. The list only proposes to spare the strain on the temper.

4. I have been asked why authorities and dates are omitted. I can only say that I reluctantly arrived at the conclusion that this was inevitable. The vast bulk of the names of garden plants are published anonymously. To merely repeat the word "Hort." some thousands of times would probably have resulted in the printers throwing up the job. To attempt to attribute the names by conjecture to individuals would have required an amount of detailed research which it was evident would strangle the whole project even if we could have spared the time. The same difficulty, though in a less degree, applied to dates.

Half a loaf is better than no bread. The first citation will put anyone who wants to trace the history of a plant on the track; and that is the most under the circumstances that we could do.

5. We have preserved at Kew, where it fills one side of a room in our very limited space, the original manuscript of the *Index Kewensis*. This contains a great deal of matter which it was not possible to publish, or that truly "monumental" work would have exceeded all practicable bounds. The manuscript is, at any rate, available for those who carry on botanical research at Kew. But I should be very much surprised if it contains any appreciable number of garden names within the limits of the present list which are not included in it. *W. T. Thiselton-Dyer.*"

ROYAL HORTICULTURAL SOCIETY.—

To the Editor of the "*Gardeners' Chronicle*."

ROYAL HORTICULTURAL SOCIETY,
117, VICTORIA STREET, S.W.

"SIR,—On behalf of the Council of the Royal Horticultural Society, and in order to allay any anxiety that may be felt by the Fellows, I shall be obliged if you will publish the following statement:—

"The General Meeting of the Society held on February 13, having unanimously adopted the proposal of the Council to celebrate the centenary of the Society by the removal of the Society's gardens from Chiswick to some spot where the atmosphere is less charged with smoke, the

Council have inspected several proposed sites, and have at least one still to investigate. The business is not one which can be hurriedly done; as soon as all the suggested sites have been properly considered by the Council, a definite proposal will be duly submitted to the Fellows.

"W. WILKS, Sec."

— The next meeting of the Committees of the Royal Horticultural Society will be held on Tuesday, March 27, in the Drill Hall, James Street, Westminster, from 1 to 5 P.M. A lecture on "Some

Selfe Leonard, Geo. Paul, &c. The discussion after dinner was on the hardiness of Tea Roses; it was opened by Mr. GEO. PAUL, V.M.H., whose long experience in the growing of this beautiful section enabled him to speak with authority. An interesting discussion (in which many of the members joined) followed the reading of the paper, and a cordial vote of thanks was given to Mr. PAUL. The question has been a good deal before the public lately, and it is hoped that Mr. PAUL's paper will appear in the *Rosarian's Year Book*, for 1901.

perature, and in water at a temperature of 53° Cent., for five minutes' duration, without being injured, although it is quite sufficient to kill both insects and eggs. The adoption of this practical and simple method is also recommended for all bought-in Vines before planting them.

HORTICULTURE IN THE CAUCASUS.—Some four or five years ago someone drew attention here to the fact that the Department of Domains for the Caucasus had determined to plant an extensive tract of land in the vicinity of Batoum, on the

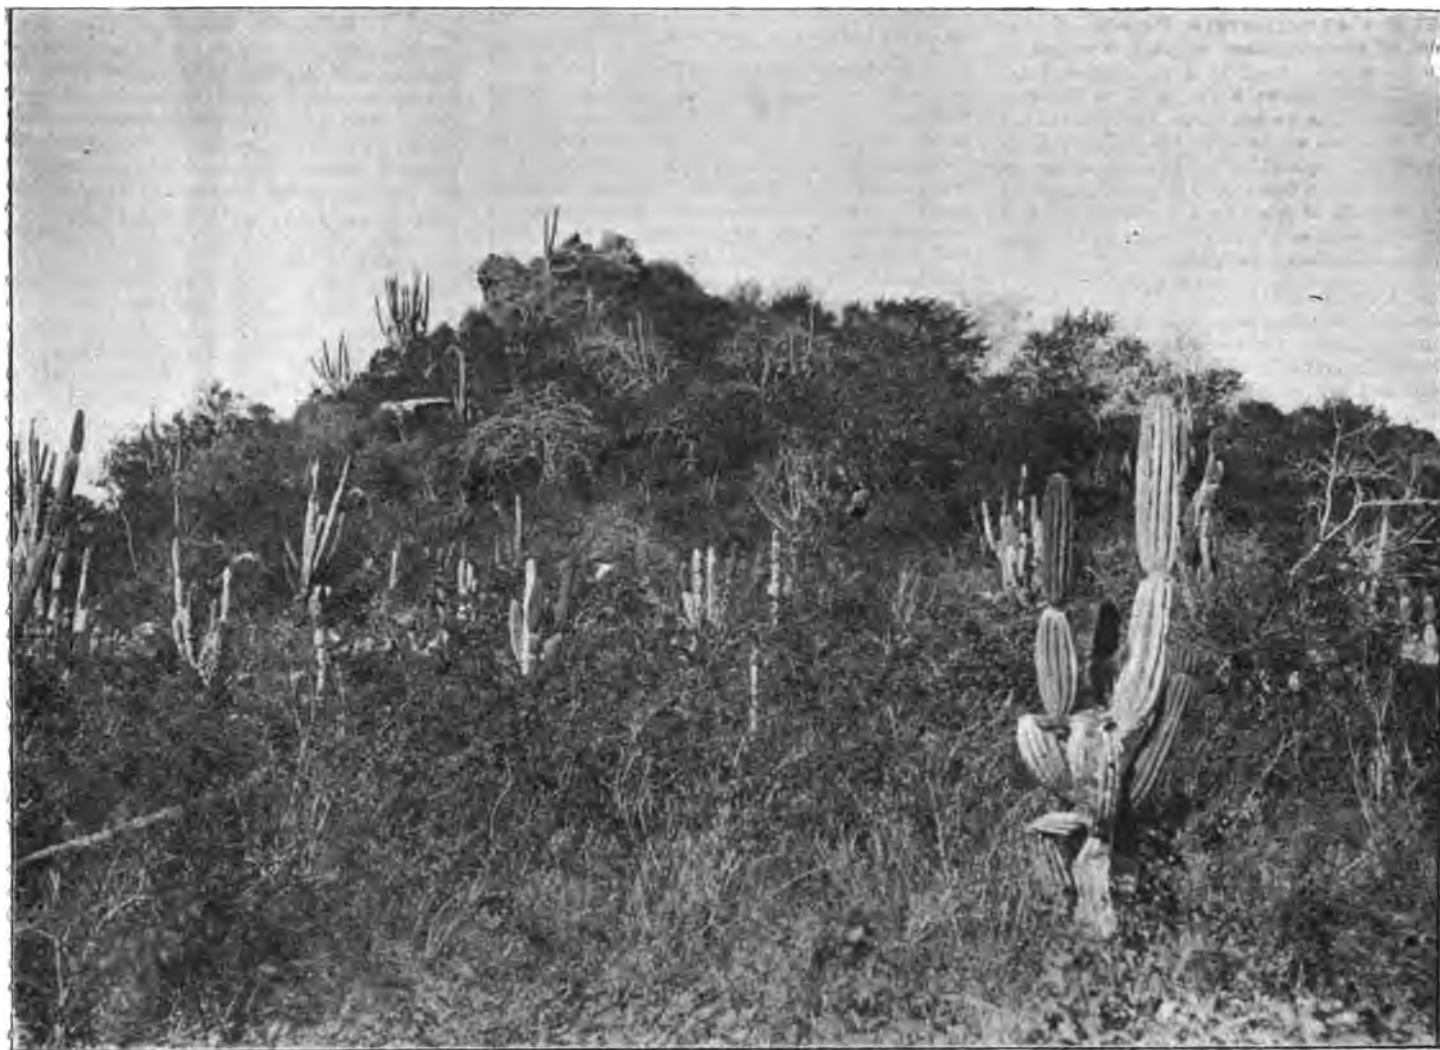

FIG. 61.—A VIEW IN THE GALAPAGOS ISLANDS, IN WHICH A SPECIES OF *CEREUS* IS PROMINENT AMONG BUSHY COMPOSITÆ, ETC. (SEE P. 177.)

of the Plants Exhibited," will be given by the Rev. Prof. G. HENSLow, M.A., at 3 o'clock.

— Some of our correspondents who attend the various Committees of the above Society, notwithstanding they live in the Midland Counties, ask how it will be possible for them to come to London, cross the City, proceed some 20 or 30 miles into a southern county to a station 2 miles from the proposed garden, and return the same day? We cannot answer the question, as we have no authentic information as to the proposed site, nor as to its distance from any station.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* took place on Tuesday, the 13th inst., when the chair was occupied by Rev. W. WILKS, and amongst those present were Messrs. Gofton, H. Salmond, G. Bunyard, A. Rivers,

HÆMANTHUS "KING ALBERT."—This is a hybrid from *H. puniceus* by *H. Katherine*, raised by Herr JOHANNES NICOLAI, of Coswig, near Dresden. The coloured illustration in the March number of the *Garten Flora* shows a fine head of scarlet flowers, and the plant is much more robust than either of its parents. A minute description of the plant is given by Dr. WITTMACK.

DISINFECTING VINE-CUTTINGS, ETC., AGAINST THE PHYLLOXERA.—Recent experiments have been carried out in France, according to the *Revue Horticole*, for the destruction of the Phylloxera insect and its eggs by placing the Vine-shoots intended for propagation purposes in water having a temperature of 40° to 50° Centigrade (104° to 122° F.). It has been found that the Vine-shoots can be kept for ten minutes in water at that tem-

perature, and in water at a temperature of 53° Cent., for five minutes' duration, without being injured, although it is quite sufficient to kill both insects and eggs. The adoption of this practical and simple method is also recommended for all bought-in Vines before planting them.

eastern side of the Black Sea, with such kinds of Tea as might be considered suitable for the district, and to have the work done by experts brought from the place of origin. So successful has the experiment proved that to-day the reports sent to the Department are all that could be desired. It had also been determined by the same Department to try the cultivation in the province of Tiflis, of Roses brought from Bulgaria. The promise of this year's crop is stated to be all that could be desired; the production of last year's crop in oil-of-roses was larger and of greater value commercially than that obtained in Bulgaria—the output of rose-water being also found to pay. The plans of the Department would thus appear to have been thoroughly matured, and the cultures removed from the domain of speculation to that of absolute certainty.

APPLES FROM AUSTRALIA, ETC.—Messrs. ANDERSON & Co., of the Orient R.M.S. Company, have received a telegram to the effect that the *Ophir* (due to arrive on April 14) will bring 16,500 boxes of Apples; the two to follow (*Britannia* and *Salamis*) will bring—the former 9600, and the latter 12,000 boxes.

HYBRIDISM IN CITRUS.—The seeds of Citrus often contain more than one embryo plant. Lately Mr. WEBBER has shown that in hybrid plants of Citrus only one of the embryos shows any trace of the pollen-parent, the true hybrid being derived from the egg-cell, and all the others by adventitious embryos produced from the nucellar tissue of the ovule.

THE BI-CENTENARY EXHIBITION OF THE SWEET PEA AT THE CRYSTAL PALACE.—On the occasion of this exhibition, which is arranged to take place on July 20 and 21 of the current year, Messrs. JAMES CARTER & Co., of High Holborn, London, intend, as we learn from a schedule of the show now before us, to offer the "Carter Commemorative Champion Cup" to the most meritorious collection of Sweet Peas staged in any of the classes in the schedule of prizes open to professional gardeners and amateur growers only, or in any non-competing miscellaneous exhibit.

THE QUEEN'S SHAMROCK.—On St. Patrick's Day, H. M. The Queen wore a plant of Shamrock, presumably *Trifolium minus*, obtained for her from St. Patrick's grave. The Queen subsequently directed that this particular root should be planted in the Royal Gardens, Frogmore, an instruction no doubt given because of the origin of this plant, as Shamrock is plentiful at Frogmore, as in most other places. It is a thrifty plant that flourishes in the poorest of soil. The Queen was pleased also to accept parcels of Shamrock from Mr. W. BAYLOR HARTLAND, Seedsman, Cork, and the acceptance has been notified to Mr. HARTLAND by her private secretary. From the same gentleman, the Secretary of State for War has accepted 1,000 packets of seed of the plant, which the Secretary states will be despatched to South Africa, and distributed among the Irish regiments.

COMING HORTICULTURAL SHOWS.—We have received the following schedules of exhibitions to be held during the present year:—The CAMBRIDGE-SHIRE HORTICULTURAL SOCIETY will hold a summer exhibition on June 12; and a Chrysanthemum, fruit, and vegetable show on November 7 and 8.—The KENT COUNTY CHRYSANTHEMUM AND HORTICULTURAL SOCIETY will hold their thirteenth annual exhibition in the Rink, Blackheath, on November 1 and 2.—The BOROUGH OF CROYDON CHRYSANTHEMUM SHOW is to take place as early as October 30 and 31, in the Public Hall, George Street.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the Lecture Hall of the Institution, on Monday, March 26, 1900, when a paper will be read by Mr. J. H. SABIN (Professional Associate), entitled "The Incidence of Imperial and Local Taxation on Rateable Property." The chair will be taken at 8 o'clock.

COUNTRY MEETING AT LEEDS.—It has been decided, on the invitation of the Yorkshire Provincial Committee, to hold the next country meeting at Leeds, on April 25 and 26. The first day will be devoted to papers and discussion, with a dinner in the evening; the second day to excursions to various places.

—Members who are graduates of any of the recognised universities of the United Kingdom are requested to intimate the fact to the secretary of the Institution, in order that the same may be indicated in the next issue of the List of Members.

HAMPSTEAD HEATH.—This well-known playground of Londoners has recently had one more charm added to it on the Golder's Hill estate, formerly the property of the late Sir SPENCER WELLS. This lovely spot exceeds 30 acres in

extent, and was secured to the public for some £36,000. To achieve the happy result has occupied the efforts of a committee originally organised by the late Mr. ERNEST HART, and the thanks of the community are due to those who have striven in and out of season to secure so fine an addition to the area of the Heath. The estate is now vested in the London County Council, and becomes for ever the property of the metropolis.

DURING THE SIEGE OF KIMBERLEY, it is reported that Mr. RHODES made a vegetable garden of some 30 acres, in his model village of Kenilworth. In such a climate as that of South Africa, a garden of this size would, if rainfall were sufficient at the time, produce an enormous amount of green food, and in making the garden a large number of men were enabled to earn sufficient money to maintain an existence.

THE NEW "CODE" FOR RURAL EDUCATION.—We have so many times urged the importance of differentiating between town and country in matters educational, that we have every reason to be pleased at the changes that the "Code" just brought out by the Education Department renders possible. Henceforth the course of instruction to be given in all elementary schools is to be suitable to the circumstances of the children and the neighbourhood. This means, of course, that in rural districts a knowledge of Nature bearing upon the culture of plants and the raising of stock will be imparted. Except in particular cases, the teacher will not be tempted to teach those special subjects which will bring him in extra grants in the easiest way. The grant will be one technically called "a block grant," made upon the efficiency of the school generally, whatever the subjects taught. Lessons on "common things," which in the country obviously will largely be "object-lessons from Nature," are to be given in the higher and lower standards alike, and a new course of household management has been devised for girls. Among the subjects on which special grants may still be obtained are manual instruction and gardening, and the school-garden may even yet become universal, in spite of the *Schoolmaster's* sneers at the Agricultural Education Committee, and the latter, knowing full well that all its wishes cannot be fulfilled at once, "hails with the greatest satisfaction the provisions of the new day-school Code," which we might add are due in a great measure to the energy displayed in the formation and work of that still youthful body.

THE WEATHER IN IRELAND.—The weather during March has been much better than that of February. There has been little rain, but an occasional keen wind. On the 17th and 18th there was snow, but it soon disappeared. The season will probably be a late one, as the principal field operations have only been commenced in earnest this month, and the planting of Potatoes is scarcely finished.

PUBLICATIONS RECEIVED.—*Lectures on Some of the Physical Properties of Soil*, by Robert Warrington, M.A., F.R.S. (Oxford, Clarendon Press), 1900. This book will be reviewed in our columns later on.—*Cassell's Illustrated History of the Boer War*, No. 1 (Cassell & Co., Ltd., London, Paris, New York, and Melbourne). Just such a record of adventures as boys, and some of their elders also, will appreciate.—*Report of the Institute W. Schimmelfeng*, January, 1900. The Institute was founded "to further and protect the just interests of the business community throughout the civilised world."—*From West Virginia Agricultural Station, Morgantown, W.
